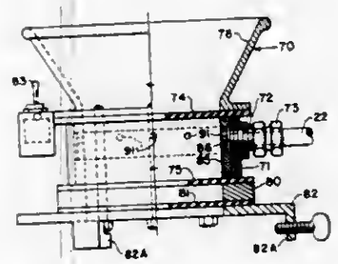
HYDRAULIC POWERED LUBRICATOR AND SPRAYER

Armand R. Conti, 3464 N. Wendover Circle, Youngstown, Ohio 44511

Continuation-in-part of Ser. No. 577,698, May 15, 1975, abandoned. This application Feb. 17, 1976, Ser. No. 658,353
Int. Cl.² B05C 3/02; G01F 11/02
U.S. Cl. 427—434 E **12 Claims**



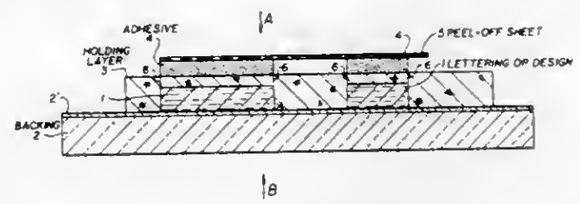
1. Apparatus powered by hydraulic fluid pressure for the delivery of liquid and semiliquid materials, such as a viscous fluid, a thixotropic gel or a gel-type grease, said apparatus including the combination of:
means for pressurizing hydraulic fluid,
a hydraulic motor powered by the pressurized hydraulic fluid,
valve means for controlling said hydraulic motor,
a container forming a supply reservoir for said liquid and semiliquid materials,
pump means driven by said hydraulic motor to withdraw the material from the container while pressurizing the withdrawn material,
an open-ended collar having an open discharge orifice in the side wall thereof,
a conduit line to interconnect said pump means with the open discharge orifice of said discharge means for discharging pressurized material,
resilient wiper means at the opposite ends of said collar to form an internal chamber wherein the pressurized material delivered by said conduit line is discharged from said open orifice onto the surface of an article while passing through the collar between said resilient wiper means, and
means to control the discharge of the material from said open discharge orifice only by controlling the pressurization of the material by said pump means.

4,028,474

WEATHERPROOF DECAL

Francois Martio, c/o Ste d'Exploitation des Procedes F. Martio dite SEPMA, Oursbelille 65 490, France

Continuation of Ser. No. 430,488, Jan. 3, 1974, abandoned. This application Mar. 1, 1976, Ser. No. 662,547
Claims priority, application France, Jan. 3, 1973, 73.00529
Int. Cl.² B32B 3/22, 7/02, 7/06, 7/14; C09J 7/02
U.S. Cl. 428—40 **7 Claims**



1. A decal comprising a backing with a smooth surface, lettering or designs of given contours placed on said smooth surface preferably in reverse fashion, anchoring means comprising a substantially dried adhesive material, and anchoring means covering said lettering or designs and said smooth surface, an edge of reduced thickness in said anchoring means, said edge extending at said contours of the lettering or designs, said anchoring means securing the lettering or designs to said smooth surface and in position relative to each other, and an adhesive layer covering said anchoring means only in the areas of said lettering or designs, said adhesive layer and said anchoring means being composed of the same adhesive agent, said adhesive layer having a greater adhesive strength than said anchoring means due to the dispersion of talcum and a mineral oil in the composition of the anchoring means and not in the adhesive layer, whereby the adhesive layer sticks more strongly than the anchoring means to facilitate the ripping of the anchoring means along said edge when the decal is transferred from the backing to a surface.

2. The decal according to claim 1, further comprising a peel-off sheet on said adhesive layer.

4,028,475

SECURITY FILM FOR SHATTERPROOFING WINDOWS

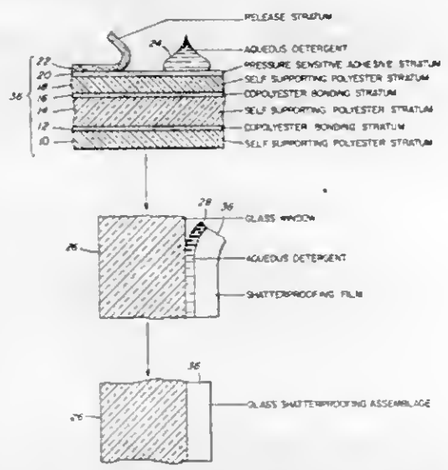
Michael E. Willdorf, Malden, Mass., assignor to Material Distributors Corporation, Woburn, Mass.

Filed May 21, 1975, Ser. No. 579,388
Int. Cl.² B32B 17/08; B60J 1/06, 3/00; B32B 15/08
U.S. Cl. 428—215 **2 Claims**

1. A security film comprising as laminated components:
a. from two to five self-supporting strata, each of said self-supporting strata ranging in thickness from 1 to 3 mils and being composed of biaxially oriented polyethylene terephthalate;
b. a plurality of inner bonding strata laminating said self-supporting strata together, each of said inner bonding strata ranging in thickness from 0.1 to 0.3 mil and consisting essentially of a copolymer of polyethylene terephthalate;
c. a pressure-sensitive adhesive stratum on one face of said self-supporting strata, said pressure sensitive adhesive

stratum ranging in thickness from 4 to 15 times the thickness of one of said inner bonding strata and consisting essentially of 15 to 30 parts of an acrylic resin and from 2.5 to 7.5 parts of a polyene tackifier wherein said pressure-sensitive stratum is characterized by a 72° F rolling ball test value ranging from 1/16 to 6 inches, a 72° F static sheer value ranging between 1 and 5 hours, and by a 180° F static peel test value ranging between 7.5 and 75 ounces;

d. all of the strata of said security film being optically clear and the overall thickness of said security film ranging in thickness from 3 to 6 mils wherein the thickness of said inner bonding strata is from 6 to 18 percent of said overall thickness and the thickness of said pressure-sensitive adhesive stratum ranges from 13 to 26 percent of said overall thickness;



e. whereby said laminated components provide sufficient overall flexibility to permit high incremental pressure when squeegeed onto a glass window, sufficient tensile modulus, impact strength and tear strength imparted by said self-supporting strata to preclude rupture while distributing shock; particular adhesion, cohesion, compatibility and resilience to withstand shock without failure, characteristic modulus of rigidity at the discontinuities between said self-supporting strata and said inner bonding strata to damp vibratory energy transfer, and particular adhesion, cohesion, compatibility and resilience imparted by said pressure sensitive bonding stratum to catch and retain glass chards produced by deformation of a laminated combination of said security film and a glass window at the moment of an impact.

4,028,476

TRANSPARENT POLYAMIDE ARMOR

Roger F. Kleinschmidt, and Robert W. Campbell, both of Bartlesville, Okla., assignors to Phillips Petroleum Company, Bartlesville, Okla.

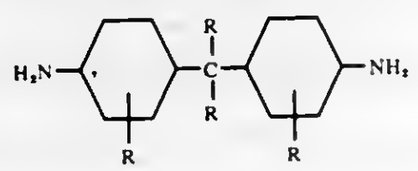
Continuation of Ser. No. 489,748, July 18, 1974, abandoned. This application Oct. 22, 1975, Ser. No. 624,619

Int. Cl.² B32B *27/34*; **F41H** *5/02, 5/06, 5/08*

U.S. Cl. 428—220 **17 Claims**

1. A lightweight, transparent armor shield having a thickness of about 1/32 inch to about 2 inches, consisting essentially of a transparent, substantially amonphouse polymeric material having an inherent viscosity of at least about 0.6 formed by the polymerization of:

A. at least one compound having the general formula

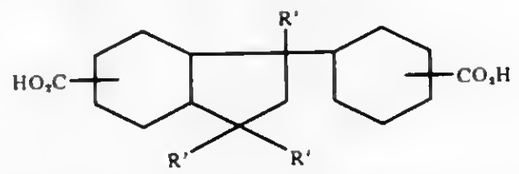


wherein each R is individually selected from the group consisting of hydrogen and $-CH_3$; and

b. at least one polycarboxylic acid having from 6 to 26 carbon atoms per molecule selected from the group consisting of:

a. straight chain dicarboxylic acids having from 6 to 18 carbon atoms,

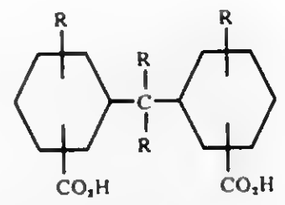
b. phenylidane dicarboxylic acids having the general formula



wherein each R' is selected from the group consisting of hydrogen and alkyl radicals having from 1 to 3 carbon atoms;

c. tricarboxylic acids having the general formula $r''(-CO_2H)_3$, wherein R'' is a trivalent saturated or aromatic hydrocarbon radical having from 3 to 12 carbon atoms,

d. bis(carboxyphenyl)methanes having the general formula



wherein R is $-H$ or $-CH_3$, and

e. mixtures thereof wherein an armor shield having a thickness of about ¼ inch is capable of having a V50 rating of at least about 878 fps, as determined according to MID-STD-662A, when fired at by a .22 califre 17-grain fragment-simulating projectile.

4,028,477

METHOD OF PRODUCING AN ARTICLE OF THERMOSETTING RESIN

Johan M. Goppel, and Peter R. Chant, both of Delft, Netherlands, assignors to Shell Oil Company, Houston, Tex.

Division of Ser. No. 366,381, June 4, 1973, Pat. No. 3,915,783, which is a continuation-in-part of Ser. No. 208,937, Dec. 16, 1971, abandoned. This application Mar. 6, 1975, Ser. No. 556,075

Int. Cl.² B32B *5/18*

U.S. Cl. 428—285 **4 Claims**

1. A rigid laminated article comprising a dense compressed cellular foam core interposed between fibrous layers uniformly impregnated throughout their respective thickness with a hardened thermosetting resin, said foam core having substantially all of the open cell space therein filled with a hardened thermosetting resin and being bound to said resin-impregnated fibrous layers through said hardened thermosetting resin.

4,028,478

SAFETY SWITCH FOR SEALED GALVANIC CELLS

Gary Ronald Tucholski, Parma Heights, Ohio, assignor to Union Carbide Corporation, New York, N.Y.

Filed May 24, 1976, Ser. No. 689,524

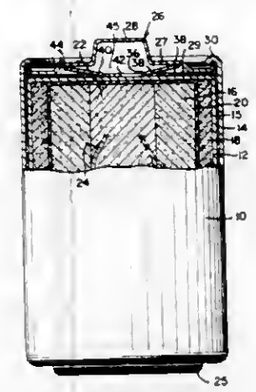
Int. Cl.² H01M *2/00*

U.S. Cl. 429—61 **6 Claims**

1. A sealed galvanic cell assembly comprising in combination:

a cylindrical metal container including a positive and negative electrode and an electrolyte, with said container being in electrical contact with said positive electrode;

an outer cover mounted over said metal container and being of a predetermined configuration to form a substantially centrally located cavity between said cover and said container;



switch means disposed in said cavity for providing an electrical connection between said container and said outer cover during normal operation of the cell and being responsive to a predetermined expansion of said container for irreversibly breaking such electrical contact;

said switch means being held in a slidable relationship with said container and cover and comprising an electrically conductive spring member having an inclined deformable section and a substantially centrally disposed opening.

4,028,479

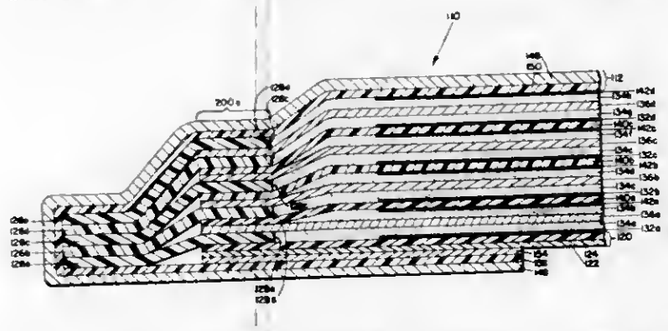
FLAT BATTERY

Ralph D. Fanciullo, Waltham, and Ludwig G. Fasolino, Wellesley, both of Mass., assignors to Polaroid Corporation, Cambridge, Mass.

Continuation-in-part of Ser. No. 536,379, Dec. 26, 1974, abandoned, which is a continuation-in-part of Ser. No. 478,061, June 10, 1974, Pat. No. 3,907,599. This application Jan. 27, 1976, Ser. No. 652,735

Int. Cl.² H01M *6/48*

U.S. Cl. 429—152 **18 Claims**



1. In a thin planar battery having a multiplicity of discrete electrically conductive polymeric layers arranged in cooperative electrical association with one another to form a multicell battery, the improvement comprising:

continuous frame-type electrically insulative sheet sealing means providing an opening defined by an inner border and having a first surface bonded to a peripheral surface of each discrete electrically conductive polymeric layer, said sheet sealing means extending outwardly from the periphery of the so bonded electrically conductive layer to define a continuous border sealing portion; and

discrete, sheet-type separator means positioned between the electrically conductive layers and having a periphery extending beyond the sealing means inner opening and within said border sealing portion which periphery is bonded to the surface of the sealing means opposite the first surface.

4,028,480

PHOTODEGRADABLE POLYMER COMPOSITIONS

Genevieve Le Brasseur, Bully les Mines, France, assignor to Societe Chimique des Charbonnages - CdF Chimie, Paris, France

Filed Apr. 15, 1976, Ser. No. 677,377

Claims priority, application France, Apr. 17, 1975, 75.12000

Int. Cl.² C08J *3/20*

U.S. Cl. 526—3 **6 Claims**

1. A photodegradable polymer composition comprising at least one polymer selected from the group consisting of polyethylene and polystyrene and copolymers thereof and from 1 to 500 ppm based on the polymer of ferrous iron in the form of a salt of a carboxylic acid, said acid having an alkyl chain containing at least 6 carbon atoms and being substituted in at least one of the second, third, fourth or fifth positions relative to the acid group with at least one of the radicals selected from the group consisting of carboxylic acid, sulphonic acid, alcohol and amide radicals.

4,028,481

PRODUCTION OF OLEFIN POLYMERS AND NOVEL CATALYSTS THEREFORE

Tetsunosuke Shiomura; Akiro Ito; Yoshio Morimoto, and Tetsuya Iwao, all of Nagoya, Japan, assignors to Mitsui Toatsu Chemicals, Incorporated, Tokyo, Japan

Continuation of Ser. No. 153,791, June 16, 1971, abandoned. This application Aug. 6, 1973, Ser. No. 385,665

Claims priority, application Japan, June 18, 1970, 45-52420; July 31, 1970, 45-66627; Nov. 6, 1970, 45-97711; Dec. 28, 1970, 46-129938; Dec. 28, 1970, 46-129934; Dec. 28, 1970, 46-129935; Dec. 29, 1970, 46-129922; Dec. 29, 1970, 46-129924

Int. Cl.² C08F *4/66, 10/06*

U.S. Cl. 526—142 **17 Claims**

1. A catalyst composition useful for polymerizing α-olefins comprising:

A. An activated titanium trichloride component obtained by copulverizing a titanium trichloride composition with a complex or reaction product of an aluminum halide and at least one organic oxygen-containing compound selected from the group consisting of oxyethers, carboxylic esters and oxyketones and washing the product of copulverization with a solvent selected from the group consisting of aliphatic, cycloaliphatic and aromatic hydrocarbons, their halogen derivatives and mixtures thereof; and

B. an organoaluminum compound.

4,028,482

POLYMERS OF ACID ANHYDRIDE TYPE NORBORNENE DERIVATIVES AND A METHOD OF PREPARING THE SAME

Takashi Ueshima, Yokohama; Yasuzi Tanaka, Kawasaki, and Shoichi Kobayashi, Yokohama, all of Japan, assignors to Showa Denko Kabushiki Kaisha, Tokyo, Japan

Filed Sept. 19, 1974, Ser. No. 507,556

Claims priority, application Japan, Sept. 25, 1973, 48-106902

Int. Cl.² C08F *5/00, 1/42*

U.S. Cl. 526—271 **1 Claim**

1. Resinous homopolymers prepared with a reduced viscosity of 0.1 to 20 measured at 30° C in a 1% by weight aqueous solution of sodium carbonate with the concentration of the polymers fixed at 0.2g/dl by ring-opening polymerization of acid anhydride type norbornene derivatives having a carboxylic anhydride group and selected from the group consisting of 3,6-methylene-1,2,3,6-tetrahydro-cis-phthalic anhydride; 6-(5-carboxy-bicyclo[2,2,1]-hepta-2-enyl) acetic anhydride;

3,6-methano-1-methyl-1,2,3,6-tetrahydro-cis-phthalic anhydride;2-oxa-1,4-dioxo-5,8-methano-1,2,3,4,4*a*,5,8,8*a*-octahydro-naphthalene; 5,8-methano-1,2,3,4,4*a*,5,8,8*a*-octahydronaphthalene-1,2-dicarboxylic anhydride; 5,8-methano-1-methyl-1,2,3,4,4*a*,5,8,8*a*-octahydronaphthalene-2,3-dicarboxylic anhydride; 1,4,5,8-dimethano-1,2,3,4,4*a*,5,8,8*a*-octahydro-naphthalene-2,3-dicarboxylic anhydride; 2-oxa-1,3-dioxo-1,2,3,4,4*a*,5,8,8*a*,9,9*a*,10,10*a*-dodecahydroanthracene and 4-(5-bicyclo[2,2,1]-hepta-2-enyl) phthalic anhydride.

4,028,483

EPDM INTERPOLYMERS FORMED WITH UNSATURATED ORGANOSILANES

William C. Bond, Jr., and Harold J. Wahlborg, both of Baton Rouge, La., assignors to Copolymer Rubber & Chemical Corporation, Baton Rouge, La.

Continuation-in-part of Ser. No. 592,381, July 2, 1975, abandoned, which is a continuation-in-part of Ser. No. 340,221, March 21, 1973, abandoned, which is a continuation of Ser. No. 102,929, Dec. 30, 1970, abandoned. This application Sept. 8, 1975, Ser. No. 610,987

Int. Cl.² C08F *30/08, 130/08, 15/40, 4/44*

U.S. Cl. 526—279 **16 Claims**

1. An interpolymer which is the product of the interpolymerization in the presence of a Ziegler type catalyst of monomers consisting essentially of (1) ethylene, (2) a monoolefin having from 3 to 20 carbon atoms, (3) a polyene selected from the group consisting of an open chain polyunsaturated hydrocarbon having from 4 to 20 carbon atoms and a polyunsaturated bridged ring hydrocarbon, and (4) an ethylenically unsaturated organosilane having the general formula R_nSiX_{4-n} in which X is a highly hydrolyzable group selected from the group consisting of a halogen and a tertiary amine, *n* is an integer from 1 to 3, and R is a group selected from the group consisting of hydrogen, alkyl, aryl, alkaryl, arylalkyl, cyclic or heterocyclic group, in which at least one of the R groups is a norbornenyl group, in which the ethylene and monoolefin are present in the interpolymer in the mole ratio of 20-95 moles ethylene to 80-5 moles monoolefin, the polyene is chemically bound in the interpolymer in an amount within the range of 0.1 to 10 mole percent of the total number of moles of ethylene, monoolefin and polyene, and the unsaturated organosilane is present in the polymer in an amount of more than 0.01% but less than 1.0% by weight.

4,028,484

ALFIN POLYMERIZED RUBBER

Avery A. Morton, 182 Standish Road, Watertown, Mass. 02172, and Edward J. Laupher, Rte. 111, E. Hampstead, Hampstead, N.H. 03826

Division of Ser. No. 193,742, Oct. 29, 1971, abandoned, which is a continuation-in-part of Ser. No. 862,681, Oct. 1, 1969, abandoned. This application Sept. 18, 1975, Ser. No. 614,540

Int. Cl.² C08F *136/06, 236/06*

U.S. Cl. 526—335 **1 Claim**

1. An alfin catalyzed rubber, selected from the group consisting of butadiene homopolymer and butadiene-styrene copolymer, of DSV greater than 9 and which compounds as soft rubber on a rubber mill after no more than about 15 minutes of mixing in the presence of no more than about 15 phr processing oil added on the mill, and being dischargeable from the mill at a temperature of no more than about 145° C said rubber having been made by polymerization in a closed reaction chamber in which the internal pressure during reaction corresponds to a vapor/liquid ratio of less than about 0.2.

4,028,485

NON-AQUEOUS REMOVAL OF SOLUBLE HYDROGENATION CATALYST

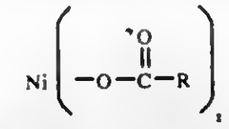
Anthony Poloso, Ridgefield, and James Gordon Murray, East Brunswick, both of N.J., assignors to Mobil Oil Corporation, New York, N.Y.

Filed Jan. 29, 1976, Ser. No. 653,413

Int. Cl.² C08F *6/08, 8/04*

U.S. Cl. 528—486 **10 Claims**

1. A process for the removal of hydrogenation catalyst residue, wherein said hydrogenation catalyst was formed by mixing (a) a C_1–C_8 alkylaluminum or a C_1–C_8 alkyllithium compound and (b) an organonickel compound of the following formula:



where R is hydrogen or C_1–C_{12} alkyl or cycloalkyl, from a solution containing said hydrogenation catalyst and from about 1 to 50 wt. % of a hydrogenated olefinic polymer in a hydrocarbon solvent, said process comprising contacting said solution with a non-aqueous organic acid followed by neutralization with anhydrous base and filtration of said solution, thereby removing said hydrogenation catalyst residue.

4,028,486

ALPHA-METHYL-p-BROMO-STYRENE AND METHOD OF PREPARATION

George Jalics, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio

Division of Ser. No. 475,711, June 3, 1974, Pat. No. 3,959,398. This application May 7, 1976, Ser. No. 684,426

Int. Cl.² C08F *12/16, 112/16, 30/02, 30/04*

U.S. Cl. 526—293 **4 Claims**

1. A copolymer of α-methyl-p-bromo-styrene and a vinyl polymerizable double bond monomer prepared by free radical addition solvent or emulsion copolymerizing a mixture of about 5 to about 20 weight percent α-methyl-p-bromo-styrene and, correspondingly, about 95 to about 80 weight percent vinyl polymerizable double bond monomer, where said double bond monomer is selected from at least one of dienes selected from 1,3-butadiene, isoprene, dimethyl butadiene and piperylene; monoolefins selected from ethylene, propylene and isobutylene; vinyl aromatic compounds selected from styrene, chlorostyrene, vinyl toluene, α-methyl styrene and divinyl benzene; monobasic acid esters selected from alkyl (C_1 to C_{10}) and alkoxy (C_1–C_4) acrylates and methacrylates; dibasic acid esters selected from maleate, fumarate and itaconates; vinyl cyanides selected from acrylonitrile and methacrylonitrile; vinyl chloride, vinylidene chloride; methyl vinyl ether; vinyl esters selected from vinyl acetate and esters of C_8–C_{10} acids; vinyl phosphonates; organophosphates selected from mono-, di- and triallyl phosphates; vinyl silanes; antimony fumarate.

4,028,487

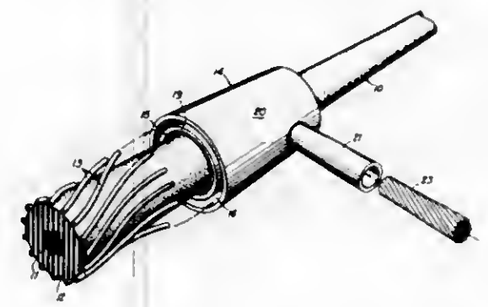
CABLE TERMINATOR AND GROUNDING UNIT

William B. McLean, 62 Pine Valley, and Edward P. McLean, Box 626, both of Moultrie, Ga. 31768

Filed June 21, 1976, Ser. No. 698,053

Int. Cl.² H02G *15/02*; **H01R** *5/10*

U.S. Cl. 174—78 **4 Claims**



1. A terminator and grounding unit for a cable having a central insulated conductor and an external concentric bare neutral conductor, said unit comprising a deformable metal sleeve to receive said insulated conductor and having an annular side wall chamber formed in one end thereof and terminating deeply within the sleeve for receiving said concentric neutral conductor, whereby the sleeve may then be externally pinched to lock the concentric neutral conductor firmly in said chamber, and a side radially extending deformable metal tube on said sleeve adapted to receive an extrinsic ground conductor and to be pinched thereon to lock the ground conductor securely within said tube.

4,028,488

SUPERCONDUCTORS

Ian Leitch McDougall, Aldridge, England, assignor to Imperial Metal Industries (Kynoch) Limited, Birmingham, England

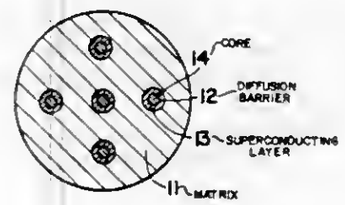
Filed Jan. 16, 1975, Ser. No. 541,648

Claims priority, application United Kingdom, Jan. 28, 1974, 3830/74

The portion of the term of this patent subsequent to Apr. 8, 1992, has been disclaimed.

Int. Cl.² H01B *12/00*

U.S. Cl. 174—128 S **10 Claims**



1. A composite superconductor assembly comprising a plurality of filaments of one component of a superconductive intermetallic compound embedded in a matrix material of a material which is non-superconductive at 5° K, there being a layer of the superconductive compound on the filaments, characterised in that the filaments have a diameter in the range 0.0005 to 0.0020 cm, and the layer of superconductive compound has a thickness in the range 0.00005 to 0.0002 cm and the interfilament distance is less than the diameter of the filaments.

4,028,489

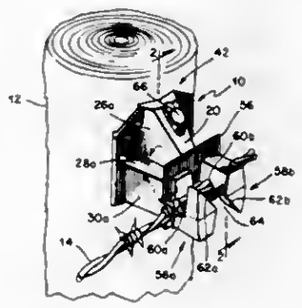
PLASTIC NAIL-ON ELECTRIC FENCE INSULATOR

Albert T. Berg, Jr., and Howard Langlie, both of Ellendale, Minn. 56026

Filed Dec. 12, 1975, Ser. No. 640,029

Int. Cl.² H01B *17/24*; **A01K** *3/00*

U.S. Cl. 174—166 R **3 Claims**



1. An all plastic nail-on electric fence insulator for attachment to wooden posts by means of a single nail comprising a body having a generally hollow interior, said body including a first angled panel inclining upwardly and rearwardly and second and third side panels extending downwardly and rearwardly from said first panel, means at the front of said body for holding an electric fence wire, and means at the rear of said body including a central panel extending between the rear edges of said second and third panels and wing panels extending laterally from said central panel, said rear means also including a first pair of rearwardly extending vertically disposed ribs at the junctures of said central panel with said wing panels and a second pair of rearwardly extending vertically disposed ribs at the free vertical edges of said wing panels, the angled first panel of said body having a nail hole therein so that a nail inserted into said hole can be driven into the post at an angle generally perpendicular to said angled first panel, a raised boss on said angled first panel, said nail hole extending through said boss and first panel, said central panel also having a hole therein at an elevation lower than that of the hole in said angled first panel, said body further including fourth and fifth panels extending laterally from the lower edges of said second and third panels and sixth and seventh panels extending downwardly from the outer edges of said fourth and fifth panels, said first, second, third, fourth, fifth, sixth and seventh panels, together with the back side of said front means and the central and wing panels of said rear means, forming said generally hollow interior, and reinforcing walls converging from the forward ends of said sixth and seventh panels rearwardly to said rear central panel, said reinforcing walls connecting with said central panel generally in forward alignment with said first-mentioned ribs.

4,028,490

MSK DIGITAL DATA SYNCHRONIZATION DETECTOR

Marvin Aaron Epstein, Monsey, N.Y., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed Nov. 14, 1975, Ser. No. 632,044

Int. Cl.² H04L *17/16, 7/00*

U.S. Cl. 178—88 **9 Claims**

1. A minimum shift keying (MSK) digital data synchronization detector for a digital data transmission system transmitting Baudot code characters each having start and stop bits in the form of a MSK digital data signal having a stop-start triangle corresponding to adjacent stop and start bits of two adjacent Baudot characters comprising:

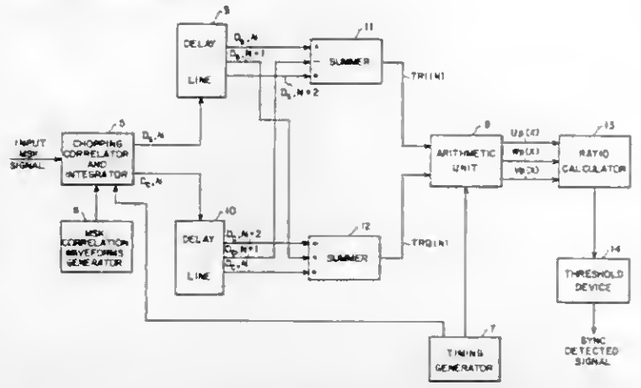
an input for said MSK digital data signal;

first means coupled to said input to produce first and second correlation signals;

second means coupled to said first means, said second means being responsive to said first and second correla-

tion signals to produce inphase and quadrature triangle signals;

third means coupled to said second means, said third means being responsive to said inphase and quadrature triangle signals to calculate many time and phase conditions of said MSK digital data signal at one time to produce third, fourth and fifth correlation signals as a function of assumed bit times; and



fourth means coupled to said third means, said fourth means being responsive to said third, fourth and fifth correlation signals to produce a ratio signal proportional to a ratio of a minimum magnitude squared to a maximum magnitude squared for all carrier phase angles for each of said assumed bit times and to produce a synchronization detected signal when said ratio signal value is less than a given amplitude threshold.

4,028,491

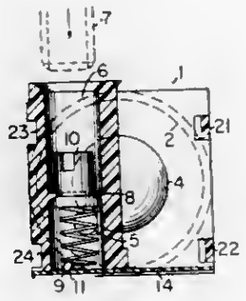
TRANSDUCER SWITCHING SYSTEM

Charles B. Huntress, Orange, and Henry Gabrielian, Newport Beach, both of Calif., assignors to Electronic Engineering Company of California, Santa Ana, Calif.

Filed Apr. 2, 1976, Ser. No. 673,182

Int. Cl.² H04R *1/00*

U.S. Cl. 179—1 SW **10 Claims**



1. A transducer switching system comprising;

a. an electro-acoustic transducer (3) having an enclosure (1) with an acoustic plug, (10)

b. an electrical resistive element (18),

c. an acoustic-use connector (7),

d. resilient electrically conductive means (9) having a small central part away from said acoustic-use connector, and deformable upon the insertion of said acoustic-use connector into said enclosure, to thereby move said acoustic plug, and

e. circuit means to conduct (16,17), connecting said transducer and said resistive element having electrical contact members (12, 15) adjacent to said resilient electrically conductive means,

whereby deformation of said resilient electrically conductive means by the insertion of said acoustic-use connector electrically shorts said resistive element from the circuit.

4,028,492

SPEECH AID APPARATUS FOR LARYNGECTOMEES

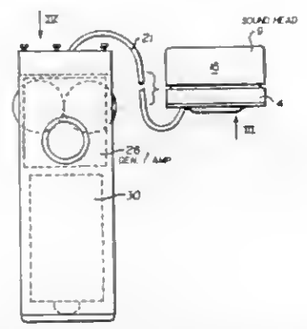
Helmut Sickel, deceased, late of Overath, Germany (by Liesbet Sickel, administrator), assignor to Dr. Kuhn & Co. GmbH, Cologne (Merheim), Germany

Filed Feb. 18, 1976, Ser. No. 659,052

Claims priority, application Germany, Feb. 22, 1975, 2507704

Int. Cl.² A61F *1/20;* **H04R** *9/06*

U.S. Cl. 179—1 AL **14 Claims**



1. Speech aid apparatus for laryngectomees, comprising a sound head consisting of a clamped hard diaphragm capable of being set in vibration by a plunger, a driver in the form of a vibration coil connected with the plunger and associated field-wise with a magnet assembly having a permanent magnet, a soft diaphragm connected to the plunger and a generator-amplifier section connected electrically to the sound head for the production of periodic current pulses for the vibration coil, wherein (a) the permanent magnet of the magnet assembly consists of a permanent magnetic material designated by the formula

$$RECo_5$$

wherein

RE represents one of the rare earth elements

Y, La, Ce, Pr, Nd, Sm or mixtures thereof, and (b) on at least one of the sound head and the generator-amplifier section there is provided a rapidly releasable device for the mechanical joining of the sound head and generator-amplifier, as well as a means for maintaining the electrical connection between the sound head and generator-amplifier section when the mechanical coupling is released and the sound head is spatially removed from the generator-amplifier section.

4,028,493

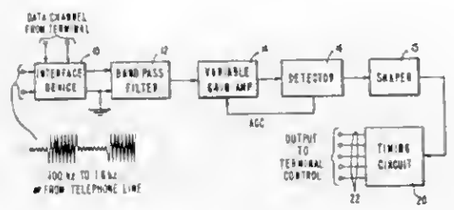
CALL PROGRESS SIGNAL DETECTOR

Andrew Ernest Brennemann, and Suk Suet Soo, both of Ossining, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 22, 1975, Ser. No. 643,213

Int. Cl.² H04M *11/06*

U.S. Cl. 179—2 DP **10 Claims**



1. A system for analyzing audio telephone call progress signals including means for coupling the audio signal on the telephone system to said analyzing means,

means for minimizing transient signal effects present in received signals, and normalizing the signal magnitudes,

detector means for removing the AC component from said normalized signal,

means for detecting the cadence of said pulses and,

means responsive to said cadence detector for indicating which one of a particular call progress signal is present on the telephone line.

4,028,494

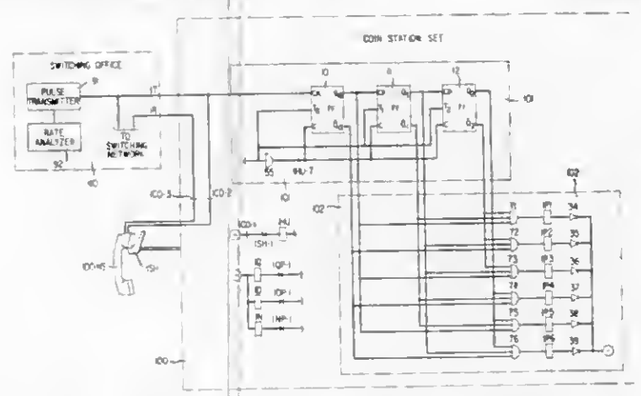
ESCROW TELEPHONE COIN COLLECTION CIRCUIT AND METHOD

Alfred Zarouni, Middletown, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed May 17, 1976, Ser. No. 687,291

Int. Cl.² H04M *17/00*

U.S. Cl. 179—6.3 R **13 Claims**



1. A pay telephone station set arrangement comprising:

means for controlling the storage of one or more deposited coins to establish a variable customer credit balance in accordance with the number and denomination of said deposited coins,

means at said set operative at the inception of a call for receiving rate indicating signals,

adjustable circuit means controlled by said receiving means for generating credit reduction signals throughout said cell at a frequency corresponding to said rate indicating signals, and

logic circuit means for coupling said credit reduction signals to said controlling means to decrement said customer credit balance as said call progresses.

4,028,495

TIME DIVISION COMMUNICATION SYSTEM ADAPTED TO STRUCTURAL EXPANSION

Hiroshi Funamo; Toshiro Kunihiro, and Masaaki Murai, all of Tokyo, Japan, assignors to Nippon Electric Company, Ltd., Tokyo, Japan

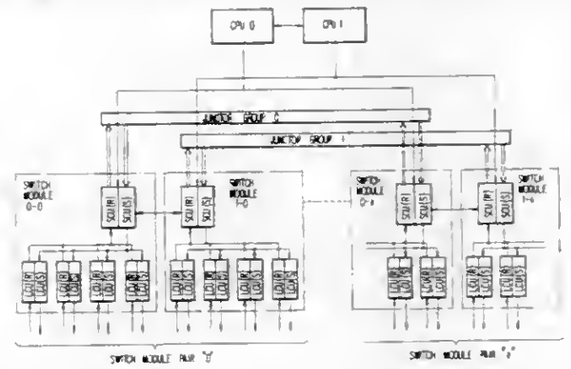
Filed Dec. 29, 1975, Ser. No. 645,069

Claims priority, application Japan, Dec. 30, 1974, 50-1642

Int. Cl.² H04M *3/00*

U.S. Cl. 179—15 AT **3 Claims**

1. A time division communication system adapted to structural and capacity expansion, comprising: $2n$ switch modules (n is a positive integer) each composed of m line control units (m is a positive integer) for accommodating m lines and a time division switch control unit capable of controlling $2m$ line control units; said switch modules being connected as n switch module pairs each composed of two switch modules with the switch modules of each said switch module pair being provided with cross connections for enabling the respective time division switch control units to be switched over and cross connected for enabling the respective switch modules to mutually send and receive time-division multiplexed information; and the input and output terminals of the corresponding time division switch control units of the respective switch module pairs being interconnected so that the respective ones of said switch module pairs may mutually send and receive said time-division multiplexed information.



4,028,496

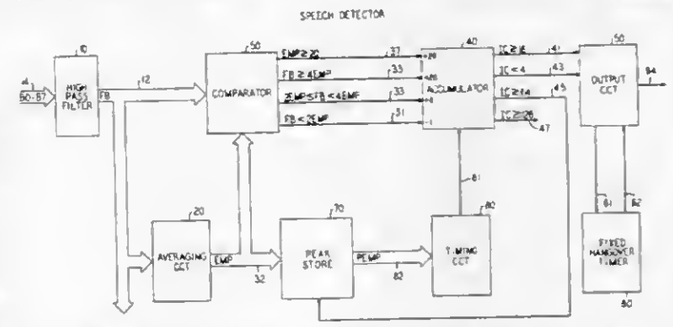
DIGITAL SPEECH DETECTOR

Robert Ernest LaMarche, Atlantic Highlands; Carl Jerome May, Jr., Holmdel, and Timothy James Zebo, Freehold, all of N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Aug. 17, 1976, Ser. No. 715,121

Int. Cl.² H04J *6/00*

U.S. Cl. 179—15 AS **17 Claims**



1. A speech detector, means for receiving input signal samples, means for generating a representation of the average magnitude of said samples, means for comparing each said sample with said representation and for providing an output signal corresponding to the difference therebetween, and means for accumulating said output signals, said accumulating means generating different control signals corresponding to different predetermined levels of said accumulated output signals.

4,028,497

ACQUISITION TECHNIQUE FOR TIME DIVISION MULTIPLE ACCESS COMMUNICATION SYSTEM

Akio Saburi, Tokyo, Japan, assignor to Nippon Electric Company, Ltd., Tokyo, Japan

Filed Apr. 1, 1976, Ser. No. 672,797

Claims priority, application Japan, Apr. 4, 1975, 50-41437

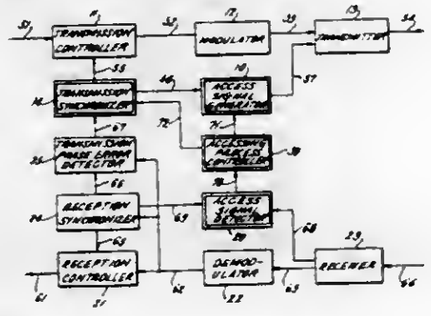
Int. Cl.³ H04J *3/06*

U.S. Cl. 179—15 BS **17 Claims**

1. Apparatus for initially accessing a relay station in a time division multiple access (TDMA) communication system in which a plurality of transmitting-receiving stations communicate with each other through the relay station and in which a transmitting-receiving station wanting to enter into communication transmits an access signal to the relay station and, receiving the access signal as relayed back therefrom, determines the position of the access signal within the time frame of the TDMA communication system so that information signals from the transmitting-receiving station may be inserted in the time slot assigned thereto for time division channel connec-

tion, said apparatus being characterized in that the transmitting-receiving station is provided with:

means for generating a signal the frequency of which varies

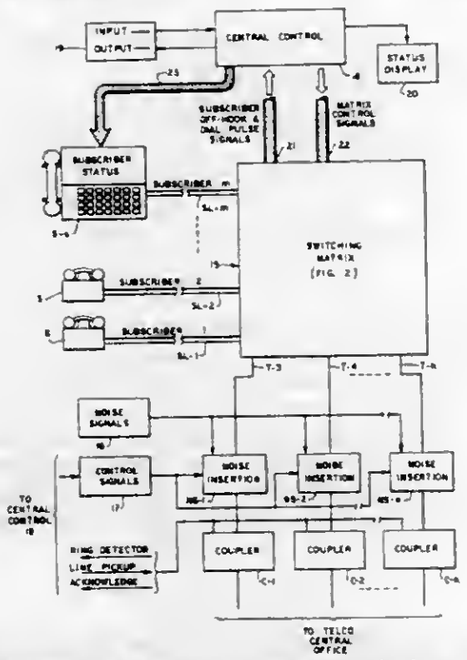


cyclically in periods each being related to those of the time frame of the TDMA communication system and transmitting such signal as an access signal to the relay station.

4,028,498
PRIVATE AUTOMATIC BRANCH EXCHANGE SYSTEM AND APPARATUS

Joseph H. Mehaffey, Atlanta; Edgar C. Mills, Marietta, and J. Harold Ivester, Smyrna, all of Ga., assignors to Solid State Systems, Inc., Marietta, Ga.

Filed Oct. 7, 1974, Ser. No. 512,675
Int. Cl.² H04Q *3/42*
U.S. Cl. 179—18 GE **15 Claims**



1. Apparatus for selectively coupling a telephone central office circuit to subscriber equipment, comprising:

first solid state means having a control circuit which is operatively coupled to said central office circuit and responsive to a ringing signal on said central office circuit to provide a signal on a ring detection circuit which is electrically isolated from said central office circuit;

switch means connected to said central office circuit and selectively operative to complete a circuit interconnection between the central office circuit and a subscriber circuit;

second solid state means having a control circuit which can receive a line pickup signal which is electrically isolated from said central office circuit and which is operative in response to said line pickup signal to control said switch means to complete said circuit; and

third solid state means having a control circuit which is connected to be responsive to current flow through said central office circuit and through said switch means to provide an output signal on a line pickup acknowledge circuit which is electrically isolated from said central office circuit.

6. An addressable N × M switching matrix, comprising:

a first number M of subscriber lines in parallel matrix array, each subscriber line comprising at least a pair of conductors for connection with a separate subscriber station;

a second number N of trunk lines in parallel matrix array with each other and in crossing relation with each of said subscriber lines, each of said trunk lines comprising at least a pair of conductors;

switching means separately and independently associated with each crossing point of subscriber lines and trunk lines in said matrix, each said switching means being selectively operative to connect a subscriber line to the trunk line at such crossing point; and

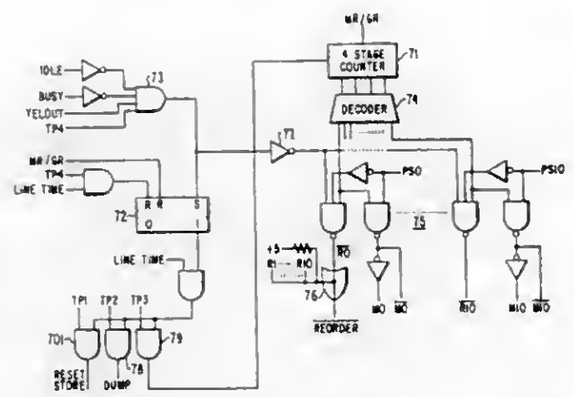
a number M of addressable switch actuating means;

one of said addressable switch actuating means being operatively associated with all of said switching means for said crossing points of a particular subscriber line, with each said addressable switch actuating means being operative to enable any of said associated switch means in response to a predetermined enabling input signal to said addressable switch actuating means, whereby a portion of the particular subscriber line and the subscriber station connected to said portion become connected to a selected said trunk line at the matrix crossing point controlled by said selected switching means and become disconnected from the remaining extent of such subscriber line across said matrix, and being operative to disenable all such associated switching means in response to a reset input signal to said addressable switch actuating means, whereby any existing previous said selected trunk line connection is terminated and said subscriber line uninterruptedly crosses said trunk lines without connection thereto.

4,028,499
UNIVERSAL/ASSIGNED NIGHT ANSWERING SYSTEM FOR EPABX

Norman Hovagimyan, Cherry Hill; Anthony Domenic Iadicola, Cinnaminson, and William Paul Ianuzzi, Cherry Hill, all of N.J., assignors to RCA Corporation, New York, N.Y.

Filed Nov. 28, 1975, Ser. No. 636,094
Int. Cl.² H04M *3/58*
U.S. Cl. 179—18 BD **4 Claims**



1. In a telephone switching system having a plurality of incoming lines to be selectively coupled to selected ones of a plurality of telephone stations, said telephone stations having means for selectively producing dial signals, annunciator means responsive to a ringing signal on one of said plurality of incoming lines for indicating an active incoming line, register means responsive to an off-hook signal from a telephone station for producing answering mode signals, and means responsive to said register means for permitting interstation calls to be initiated between telephone stations not coupled to an incoming line, the improvement comprising:

coupling means responsive to said answering mode signals for directly coupling said off-hook telephone station to said active incoming line, said coupling means comprising

counter means for producing in sequence *m* combinations of signals, where *m* is an integer equal to or greater than the number of incoming lines;

decoding means responsive to said counter means for producing one-out-of-*m* signals;

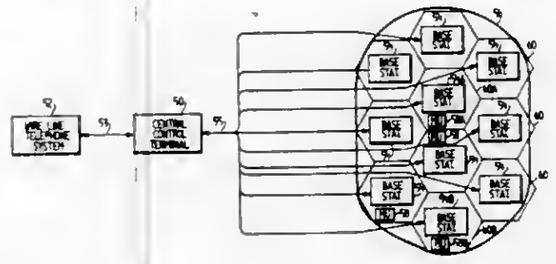
gating means responsive to said decoding means and to the ringing signal on said one of said plurality of incoming lines for producing an equipment locator signal to a switching matrix; and

terminator means responsive to an equipment locator signal from said gating means for disabling said counter means.

4,028,500
MOBILE UNIT SUPERVISORY CONTROL SEQUENCER AND METHOD

George F. McClure, Winter Park; John Richard Endicott, Maitland; Lionel D. Freeman; Marion L. Cunningham, both of Orlando, and Joel D. Wells, Orlando, all of Fla., assignors to Martin Marietta Corporation, Orlando, Fla.

Continuation-in-part of Ser. No. 360,560, May 15, 1973, Pat. No. 3,898,390. This application Apr. 21, 1975, Ser. No. 569,677
Int. Cl.² H04M *7/04*
U.S. Cl. 179—41 A **39 Claims**



1. A mobile telephone unit comprising:

first storing means for storing aan address signal representing a telephone system subscriber;

means for displaying the stored address signal;

a manually depressable call switch for generating a call initiation signal;

second stroring means for storing said generated call initiation signal;

means for selecting one of a predetermined plurality of communication channels for broadcast of a call-up signal;

means for generating a call enabling signal in response to the selection of said one communication channel;

means for broadcasting a call-up signal including said stored address signal over the selected one of the plurality of communication channels in response to the simultaneous presence of both said call initiation signal generated through the manual depression of said call switch and said call enabling signal generated in response to the selection of said one channel;

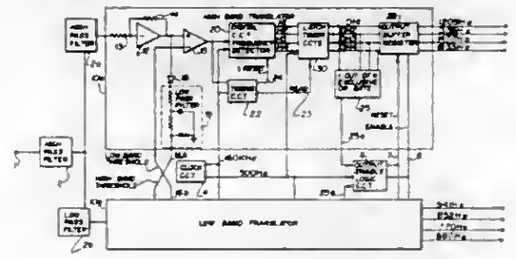
means for receiving a response signal acknowledging said call-up signal for automatically indicating receipt of said response signal; and

means including a handset removably cooperable with a hook-switch independent of said manually depressable call switch for establishing two-way voice communication over a two-way communication channel in response to removal of said handset from cooperating relationship with said hook-switch, whereby a call may be initiated and acknowledged without removing the handset from the hook-switch.

4,028,501
METHOD AND APPARATUS FOR TRANSLATING MULTIPLE FREQUENCY SIGNALLING

Dennis Edwin Rittenhouse, Kanata, Canada, assignor to Northern Electric Company Limited, Montreal, Canada

Filed Mar. 4, 1976, Ser. No. 663,687
Int. Cl.² H04M *1/50*
U.S. Cl. 179—84 VF **5 Claims**



1. A multiple frequency signalling receiver, for translating predetermined combinations of tone signals to derive signalling information therefrom, the receiver comprising:

input means for receiving voice frequency signals;

filter means, connected to the input means, for filtering the received signals into separate high and low bands;

means, connected to the filter means, for generating high band and low band threshold levels in response to the amplitudes of signals in the high and low bands respectively;

a high band detector including a high band digital circuit means for detecting ones of predetermined frequencies of the signals in the high band and for indicating the frequency detected;

first means connected between the high band digital circuit means and the filter means, the first means being responsive to the low band threshold level to transmit, to the high band digital circuit, only those signals in the high band which exceed the low band threshold level;

a low band detector including a low band digital circuit means for detecting ones of predetermined frequencies of the signals in the low band and for indicating the frequency detected;

second means connected between the low band digital circuit means and the filter means, the second means being responsive to the high band threshold level to transmit, to the low band digital circuit, only those signals in the low band which exceed the high band threshold level;

output means for indicating the frequencies detected by the detectors in response to a substantially simultaneous and constant indication of frequency detection from both detectors extending over a predetermined period of time.

4,028,502
APPARATUS FOR ADAPTING MULTI-LINE TELEPHONE INSTRUMENT FOR USE BY THE BLIND

Larry S. Moricca, Churubusco, and Gregory A. Zaker, Fort Wayne, both of Ind., assignors to Inventive Industries, Inc., Houston, Tex.

Filed Feb. 13, 1976, Ser. No. 657,719
Int. Cl.² H04M *1/72*
U.S. Cl. 179—99 **15 Claims**

11. Apparatus for adapting a multi-line telephone instrument having a plurality of line-selector pushbuttons and associated indicator lights for use by the blind comprising, for each said line-selector pushbutton, an auxiliary pushbutton, means for mounting said auxiliary pushbutton in alignment with the line-selector pushbutton whereby manual depression of said auxiliary pushbutton actuates said line-selector pushbutton, light-sensitive means for sensing illumination of the respective indicator light, means for generating an alternating current

signal in response to said light-sensitive means, and means for vibrating said auxiliary pushbutton in response to said signal

thereby to provide a vibratory discernible recognition of illumination of the respective indicator light.

4,028,503

ELECTROMAGNETIC SOUND GENERATOR

Hakon Rosenkilde, Brincks Have 5, 2630 Taastrup, Denmark

Filed Aug. 4, 1975, Ser. No. 601,284

Claims priority, application Denmark, Aug. 7, 1974, 4189/74

Int. Cl.² G10K 9/14

U.S. Cl. 179—115 R **8 Claims**

1. An electromagnetic sound generator comprising a frame, a membrane with the periphery thereof fixed to the frame and having an axis, an electromagnetic actuation means mounted on the frame for applying a cyclical force to the central portion of the membrane relative to its periphery and bending one portion of the membrane in a direction towards the elctromagnetic circuit and the other portion in a direction away from same, thereby providing a sound generator in which the sound intensity is increased by the interaction between the bending of the membrane and translation of the central portion of the membrane.

4,028,504

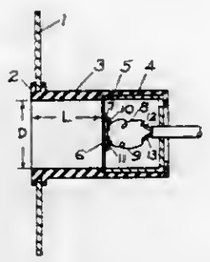
ACOUSTIC AMPLIFIER COMBINED WITH TRANSDUCER SHOCK MOUNT

Frank Massa, Cohasset, Mass., assignor to Fred M. Dellorfano, Jr., and Donald P. Massa, Trustees of The Stonelelgh Trust u/d/t, Cohasset, Mass.

Filed Nov. 12, 1975, Ser. No. 630,983

Int. Cl.² H04R 1/28

U.S. Cl. 179—146 R **8 Claims**



1. In combination in a sound detection system, an electroacoustic transducer, an acoustic amplifier comprising a tubular member, a first mounting means associated with said tubular member for holding said transducer at one end of said tubular member, said transducer and said first mounting means characterized in that said mounted transducer forms a closure at said one end of said tubular member, and further characterized in that said closure presents a plane surface at right angles to the axis of said tubular member and still further characterized in that said plane surface extends to the inner wall surface of said tubular member, and a second mounting means associated with said tubular member for attaching said tubular member to a support structure.

4,028,505

NEGATIVE IMPEDANCE REPEATER FOR TELEPHONE LINES

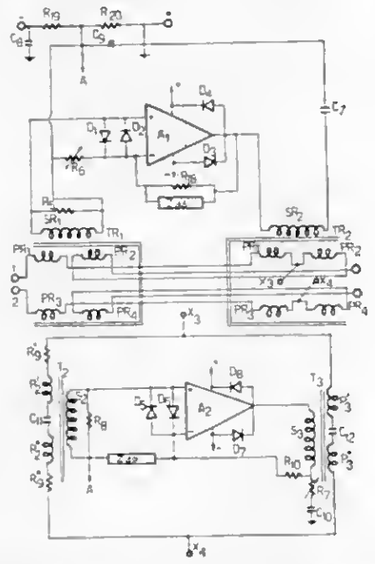
Lorenzo Fassino, Via Piedicavallo 32, Turin, Italy

Continuation-in-part of Ser. No. 441,369, Feb. 11, 1974, abandoned. This application Oct. 6, 1975, Ser. No. 619,905

Claims priority, application Italy, Mar. 12, 1973, 67674/73

Int. Cl.² H04B 3/36, 3/16

U.S. Cl. 179—170 G **3 Claims**



1. A negative impedance repeater for amplification of loaded or non-loaded telephone lines operating at voice frequency comprising:

a first open circuit stable one-port network, the terminals of which are the input terminals of a negative impedance converter, the output of which is loaded by a preset passive impedance network, chosen in relation to the characteristic impedances of the line section to be amplified;

a second short circuit stable one-port network, the terminals of which are the input terminals of a negative impedance converter, the output of which is loaded by a preset passive impedance network, chosen in relation to the characteristic impedances of the line section to be amplified;

adjusting means in each of said converters, and external to said impedance networks, for adjusting the feedback and consequently the conversion ratio;

said adjusting means being independent from each other and being manually varied on the basis of predetermined conversion ratio curves such that:

in the case of loaded lines, the product of the two conversion ratios remains constant over the entire variation range; to provide a gain adjustment which does not affect the repeater impedance and

in the case of non-loaded lines, the conversion ratio of the converter included with the short circuit stable network increases quicker than the conversion ratio of the converter included within the open circuit stable network decreases, to provide a gain adjustment which increases more quickly at the high frequencies than at the low frequencies of the transmitted band, so that an equalization, necessary for this type of lines is introduced, and, coupling means for coupling said converters to the line to be amplified.

4,028,506

MAXIMUM VALUE TRACING CIRCUIT FOR DIGITIZED VOICE SIGNALS

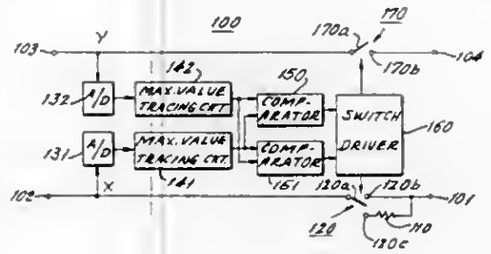
Takashi Araseki, and Kazuo Ochiai, both of Tokyo, Japan, assignors to Nippon Electric Company, Ltd., Tokyo, Japan

Filed Dec. 9, 1974, Ser. No. 530,620

Claims priority, application Japan, Dec. 12, 1973, 48-141059; Mar. 25, 1974, 49-33800

Int. Cl.² H04B 3/22

U.S. Cl. 179—170.2 **3 Claims**



3. A maximum value tracing circuit for extracting a peak value of an input signal of varying value, said input signal being periodically digitized, said tracing circuit comprising:

primary input means for receiving said periodically digitized signal;

first memory means for storing the last digital signal applied to its input terminal means and for clearing any signal stored therein at the end of each of a plurality of successive first time periods, said input signal being digitized a plurality of times during each of said first time periods;

first comparing means for comparing the digital signal stored in said first memory means to the last digital signal received by said primary input means and for generating a first control signal identifying the larger of the two signals last compared by said first comparing means;

first switch means responsive to said first control signal for applying the larger of the two signals last compared by said first comparing means to said input terminal means of said first memory means;

second memory means for storing the last digital signal applied to its input terminal means for clearing any signal stored therein at the end of each of a plurality of successive second time periods, each of said second time periods being of the same duration as each of said first time periods, the end of each of said second time periods being offset with respect to the end of each of said first time periods;

second comparing means for comparing the digital signal stored in said second memory means to the last digital signal received by said primary input means and for generating a second control signal identifying the larger of the two signals last compared by said second comparing means; output means; second switch means responsive to said second control signal for applying the larger of the two signals last compared by said second comparing means to said input terminal means of said second memory means;

third comparing means for comparing the digital signals resulting from the last comparison operations of said first and said second comparing means and appearing at the outputs of said first and said switch means and for generating a third control signal identifying the larger of the two signals last compared by said third comparing means; and third switch means responsive to said third control signal for applying the larger of the two signals last compared by said third comparing means to said output means.

4,028,507

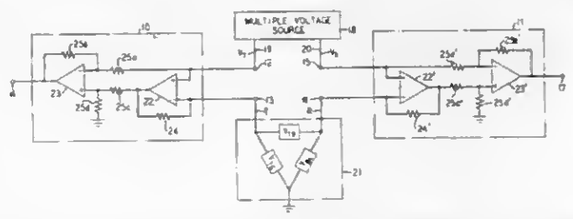
APPARATUS FOR APPLYING PARTICULAR VOLTAGES TO THREE-TERMINAL CIRCUITS AND MEASURING RESULTING CURRENT FLOWS FOR THE PURPOSE OF DETERMINING CIRCUIT CHARACTERISTICS

Richard Scott Hoppough, Greensboro, N.C., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed June 28, 1976, Ser. No. 700,333

Int. Cl.² H04B 3/46

U.S. Cl. 179—175.3 R **2 Claims**



1. Apparatus for forcing the terminals of a circuit to particular potential levels and for producing output voltages relating to currents flowing in said terminals, which output voltages may be utilized in determining the characteristics of said circuit, said apparatus comprising

first and second means each having a first input terminal for receiving an input voltage, a second input terminal for connection to one of said circuit terminals and, furthermore, which is forced to substantially the same potential level as said input voltage, and an output terminal for producing an output voltage linearly related to current through said second input terminal, and

third means operable for applying at least one combination of two voltages to said first input terminals, respectively, where said combination may comprise voltages of finite value, voltages of zero value or a voltage of finite value and a voltage of zero value.

4,028,508

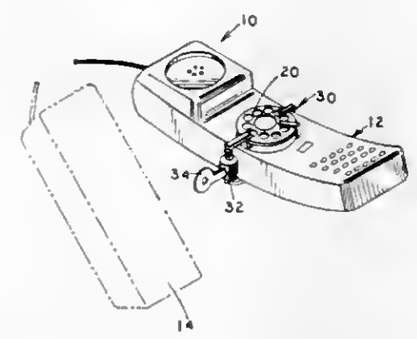
TELEPHONE LOCK

James N. Hall, 2851 Barker Ave., Bronx, N.Y. 10467

Filed June 2, 1976, Ser. No. 692,134

Int. Cl.² H04M 1/66

U.S. Cl. 179—189 D **6 Claims**



1. A telephone locking device for preventing the unauthorized use of a telephone of the type having a handset and a base portion and wherein a rotary calling dial is contained on the inside surface of the handset, said device comprising:

a generally U-shaped fixed engaging element adapted to engage said rotary dial;

a locking element attached to said fixed engaging element by means of an encircling strap positioned about the outer surface of said handset; and

a generally U-shaped adjustable engaging element adjustably secured to said locking element and adapted to engage said rotary dial in order to prevent rotation of said rotary dial.

4. A telephone locking device for preventing the unauthorized use of a telephone of the type having a handset and a base portion and wherein a plurality of pushbutton calling elements are contained on the inside surface of the handset, said device comprising:

a protective cover for said pushbutton calling elements;

a generally U-shaped fixed engaging element adapted to engage said cover;

a locking element attached to said fixed engaging element by means of an encircling strap positioned about the outer surface of said handset; and

a generally U-shaped adjustable engaging element adjustably secured to said locking element and adapted to engage said protective cover in order to prevent manipulation of said plurality of pushbuttons.

4,028,509

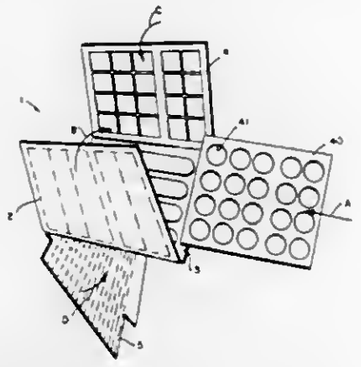
SIMPLIFIED TABULATOR KEYBOARD ASSEMBLY FOR USE IN WATCH/CALCULATOR HAVING TRANSPARENT FOLDABLE FLEXIBLE PRINTED CIRCUIT BOARD WITH CONTACTS AND ACTUATOR INDICIA

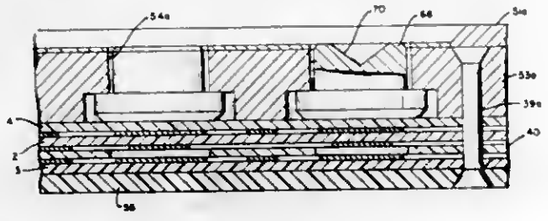
Rudolf F. Zurcher, Newport Beach, Calif., assignor to Hughes Aircraft Company, Culver City, Calif.

Filed Aug. 29, 1975, Ser. No. 608,852

Int. Cl.² G04B *47/06, 19/30;* **H01H** *9/00, 13/02*

U.S. Cl. 200—5 A **4 Claims**





1. As simplified tabulator keyboard assembly for use in a digital watch/calculator comprising:

a flexible circuit of unitary construction with metallic conductive areas and a flexible insulative backing, said flexible circuit comprising:

a lower array of contacts, each of said contacts make electrical connection to a contact terminator provided as part of said flexible circuit;

an upper array of deformable contacts, each of said deformable contacts making electrical connection to a contact terminator provided as part of said flexible circuit and being provided with a plurality of conductive tabs, one for each of said contacts in said lower array;

a flexible conductor portion for making electrical connection to at least the electronics module of said watch calculator;

said lower array and said upper array are separated by an insulative spacer having a plurality of holes, one for the intersection of each contact in said lower array with each contact of said upper array;

said upper array is folded over said lower array such that the metallic conductive portions thereof directly face the respective metallic conductive portions of said lower array but are separated thereform by said insulative spacer; and

an indicia array having a plurality of numeric and other symbols defined by a metallized region, one of such symbols being provided for each of said holes in said insulative spacer; and

said indicia array is folded over said upper array such that the metallized portions of said indicia array are in contact with the insulative backing of said upper array.

4,028,510

SAFETY DEVICE ACTUATABLE BY SEISMIC VIBRATIONS

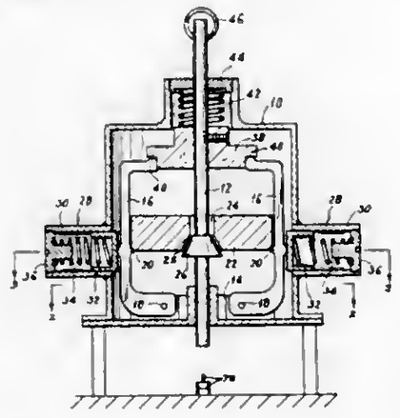
Yoshitomo Yamaura, Nagano; Takayoshi Kobayashi, Tokyo; Akira Asanuma, and Kuichiro Miyazawa, both of Nagano, all of Japan, assignors to Kabushiki Kaisha Shinko Seisakusho, Nagano, Japan

Filed Aug. 22, 1975, Ser. No. 607,045

Claims priority, application Japan, Aug. 24, 1974, 49-97272; Oct. 25, 1974, 49-123222

Int. Cl.³ H01H *35/14*

U.S. Cl. 200—61.45 R **5 Claims**



1. An apparatus actuatable by seismic vibrations comprising:

a longitudinal housing formed with a central bore and mountable on a support unit;

a rod axially penetrating said central bore and movable from an upper position to a lower position for selectively opening and closing a switch by its vertical movement;

first biasing means for biasing the rod downwardly;

a keeper member secured to an upper portion of said rod in said housing;

a plurality of stays disposed around said rod for holding said rod at the upper position against the action of said biasing means, and stays normally engaging said keeper member;

second biasing means for biasing the stays in the direction of urging engagement of each of said stays with the keeper member;

a weight support member attached to a lower portion of said rod in the housing; and

a first weight having a central portion penetrable by said rod, having a lower peripheral edge supportable at the inside thereof by each of said stays, said first weight being positioned to face an upper portion of said weight support member for pushing each of said stays outwardly during vertical and horizontal vibrations of said apparatus for

said rod to move downwardly to the second position upon separating said stays from said keeper member together with a drop of said weight, whereby said weight pressing on said weight support member increases the total mass of the downwardly moving rod.

4,028,511

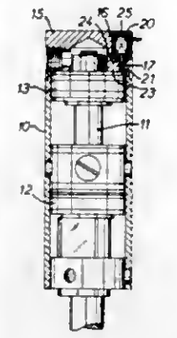
FLUID JACK WITH BUILT-IN PISTON OPERATED SWITCH

Andre Wack, 14 Rue Jules Verne, Sens; Robert Bezicot, 48 Rue Joseph Fouriaux, Antony, and Andre' Cosset, 5 Rue Claude Lebret, Gournay sur Marine, all of France

Filed June 16, 1975, Ser. No. 587,049

Int. Cl.² H01H *35/38*

U.S. Cl. 200—82 R **5 Claims**



1. The combination of a fluid jack of the type including a cylinder, a piston mounted on a piston rod movable in said cylinder along a path of movement between a retracted and an extended position, and end closure member closing said cylinder at one of its ends and having a recess opening to the exterior of said jack, said piston having an end face opposing said end closure member, a longitudinal passage extending through said end closure member from a transverse bottom wall of said recess to the interior of said cylinder; an electrical switch unit operable in response to movement of said piston to a position adjacent said end closure member, said switch unit being disposed substantially entirely inside said recess and embedded in electrical insulating material, said switch unit having an operating member extending beyond the embedding electrical insulating material, and a combined sealing and motion transmission member formed at least in part of electrical insulating material and in direct sealing contact with the wall of said passage for sealingly separating said switch unit from the interior of said cylinder, said combined sealing and motion transmission member normally projecting into the path of movement of said piston and in operative engagement with said operating member to actuate said switch unit when said piston end face comes into engagement with said sealing and motion transmission member and wherein said electrical insulating material is circumjacent said operating member along a substantial portion of its length.

4,028,512

LIQUID LEVEL ACTUATED ELECTRICAL SWITCH

Theodore E. Fiddler, 1268 Suffield Drive, Birmingham, Mich. 48008

Filed July 25, 1975, Ser. No. 599,132

Int. Cl.² H01H *35/40*

U.S. Cl. 200—84 C **1 Claim**

1. A normally open switch for closing a circuit to produce a signal voltage indicative of a condition, such as the liquid level in a tank, comprising,

a float,

means for movably mounting said float in a tank so that said float rises and falls with the level of the liquid in the tank,

electrical terminals spaced apart and lying adjacent said float connectable to signal circuits,

a bridge member for contacting said terminals to close a circuit between said terminals,

a magnet mounted at one said terminal and said bridge member,

an armature mounted at the other said terminal and said bridge member;

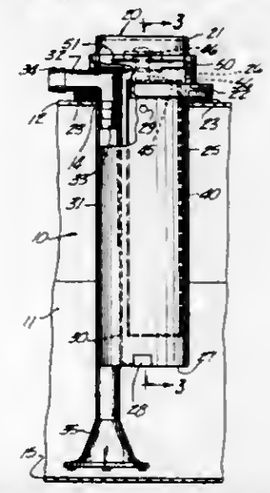
one said magnet and said armature being mounted for movement with said bridge member from a relatively remote position to a relatively proximate position relative to one another;

means connecting said float and said bridge member for moving said bridge member with said float responsive to the level of the liquid in a tank;

said float being capable of moving said bridge member toward said terminals from a relatively remote off position to an on position in contact with one another;

said magnet and said armature upon said terminals and said bridge member engaging one another in the on position, holding said bridge member and said terminals in contact with one another maintaining the on position to prevent flickering of the signal lamp;

a container enclosing said float; said container having at



least one small orifice for communicating liquid from a tank to said container at said float; said container protecting said float against sudden changes in liquid levels in the tank at the float due to outside influences to prevent movement of the float to the on position when the liquid level of the tank is not at the true refill level;

a cap housing said switch parts; said cap being connected to said container enclosing said float; said cap and said container being attachable and removable relative to a tank;

said container having an arcuate longitudinal indentation forming a receiving socket; and a liquid supply tube nested in said socket and held in position therein by the spring-like force of the engagement; said container, cap and tube forming an assembly removably mountable in a hole in the tank as a unit; said supply tube leading to the bottom of a tank on which the assembly is mounted;

said indentation in said container lying adjacent to said float; said float having a channel receiving said indentation; said indentation and channel forming a guide for up and down movement of the float preventing angular movement of said float to maintain said electrical terminals and said bridge member in alignment.

4,028,513

STEEL ARCING CONTACT FOR CIRCUIT BREAKER

Ward E. Laubach, Cherry Hill, N.J., assignor to I-T-E Imperial Corporation, Spring House, Pa.

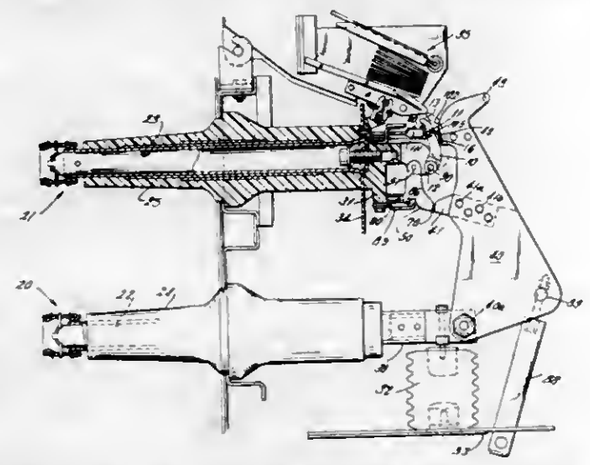
Filed May 8, 1975, Ser. No. 575,717

Int. Cl.² H01H *33/12*

U.S. Cl. 200—144 R **7 Claims**

1. In a high power circuit breaker; a first stationary main terminal and second stationary main terminal, first and second

main contacts movable between an engaged and disengaged position relative to one another and connected to said first and second main terminals, respectively, first and second arcing contacts electrically connected to said first and second main contacts, respectively, and to said first and second main stationary terminals, respectively, and movable between an engaged and disengaged position; said first and second arcing contacts being engaged before and disengaged after said first and second main contacts are engaged and disengaged, respectively; said first main contact having a major body portion



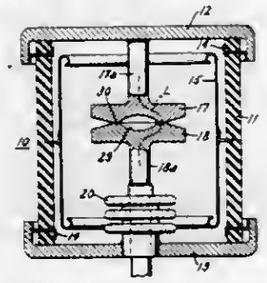
of highly conductive metal; said first arcing contact having a major body portion consisting of a ferrous material and having a resistivity which is greater than the resistivity of said major body portion of said first main contact; said first arcing contact having a contacting tip portion for making engagement to said second arcing contact which is of an alloy of copper which has a greater resistance to erosion under the influence of an electric arc than either the said highly conductive metal material of said first contact or said ferrous material.

4,028,514

HIGH CURRENT VACUUM CIRCUIT INTERRUPTER WITH BERYLLIUM CONTACT

Donald R. Kurtz; Carl C. Popadick, both of West Chester; Joseph C. Sofianek, Broomall, and Joseph L. Talento, Media, all of Pa., assignors to General Electric Company, Philadelphia, Pa.

Filed Dec. 3, 1974, Ser. No. 529,178
Int. Cl.² H01H *33/66, 1/02*
U.S. Cl. 200—144 B **14 Claims**



CAST AND EXTRUDED BERYLLIUM

1. A vacuum-type circuit interrupter rated for interrupting currents of 30,000 amperes r.m.s. and higher comprising:

a. a highly evacuated envelope,

b. a pair of separable contacts within said envelope that are relatively movable between engaged and disengaged positions,

c. said contacts having arcing portions between which arcs are formed upon disengagement of said contacts, said arcing portions including arc-initiation regions between which said arcs are initiated upon contact-disengagement,

d. said arcing portions being of a material consisting essentially of beryllium formed from an ingot cast in an inert environment, which ingot has been subject to hot working to produce a microstructure that is characterized by grains much smaller on the average than the average grain size of the as-cast ingot.

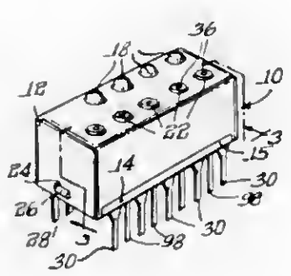
SPRING CONTACT SWITCH FOR DUAL IN LINE MULTIPLE SWITCH ASSEMBLY HAVING MOMENTARY ACTUATED LIGHTED INDICATORS

Frank B. Desio, Melrose Park, and Samuel Lee Webb, Lisle, both of Ill., assignors to Illinois Tool Works Inc., Chicago, Ill.

Filed Sept. 15, 1975, Ser. No. 613,696
Int. Cl.² H01H *13/32, 1/06*
U.S. Cl. 200—276 **3 Claims**



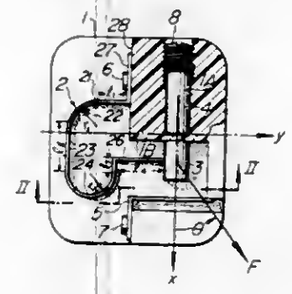
1. An electrical switch mechanism comprising a horizontally disposed base, first and second spaced-apart contact members which extend vertically upward from said base, a wound coil spring, the lower portion of which is supported in a vertical manner by receipt of the upper portion of said first contact member inside the lowermost end coils of said spring so that the lowermost end coils of said spring encircle said upper portion of said first contact member, said coil spring being bent in a smooth arc that prevents buckling of said coil spring during operation of said switch, and a depressible actuating member which has a cam surface thereon which contacts and deflects the upper portion of said spring toward said second contact member to form said smooth arc so that said upper portion of said coil spring directly overlays but does not contact said second contact member when said actuating member is in its undepressed condition and which further deflects said upper portion of said coil spring downwardly into contact with said second contact member with the lowermost end coils of said coil spring continuing to encircle the upper portion of said first contact member when said actuating member is depressed, so that an electrical circuit between said first and second contact members is thereby made and said coil spring acts to return said actuating member to its initial undepressed position following the release of actuation pressure on said actuating member.

4,028,516

ACCELERATION DETECTOR SWITCH HAVING MAGNETIC BIASED CONDUCTIVE OSCILLATING CONTROLLER

Kenzo Hirashima; Harutoshi Tsujimura, both of Yokohama; Akira Hasegawa, Katsuta; Takahiko Tanigami, Mito, and Kenichi Ushiku, Katsuta, all of Japan, assignors to Hitachi, Ltd. and Nissan Motor Co., Ltd., both of, Japan

Filed Jan. 8, 1975, Ser. No. 539,425
Claims priority, application Japan, Jan. 14, 1974, 49-6574
Int. Cl.² H01H *35/14*
U.S. Cl. 200—61.45 M **15 Claims**



1. An acceleration detector, wherein a magnet and a fixed contact member are mounted on a base mount, and an inertial body serving as a movable contact and located between said magnet and said fixed contact is secured to the free end of a plate-spring, while the other end of said plate-spring is secured to said base mount, whereby when an acceleration of a predetermined magnitude is applied to said inertial body, said inertial body is biased against an attracting force of said magnet to contact said fixed contact member, thereby closing an electric circuit, characterized in that the widthwise direction of said plate-spring is perpendicular to the line extending between the center of said magnet and the center of said fixed contact, and that said plate-spring includes at least a pair of opposing curved portions formed between the fixed end and free end thereof, wherein said pair of curved portions are disposed in facing relationship to one another with the respective centers of curvature of said pair of facing curved portions being located in facing relationship to the same surface of said plate-spring.

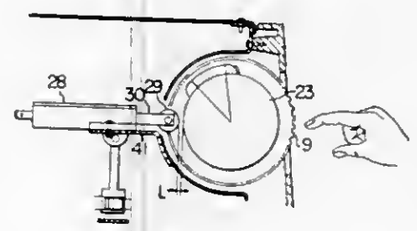
MICROWAVE OVEN

Junzo Tanaka, Fujlidera, and Chikao Nakano, Yamatokoriyama, both of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Filed Feb. 28, 1975, Ser. No. 554,113
Claims priority, application Japan, Mar. 4, 1974, 49-25427
Int. Cl.² H05B *9/06*
U.S. Cl. 219—10.55 B **6 Claims**



1. In a microwave oven including, an oven body having a heating cavity therein, a door for opening or closing a front opening of said heating cavity, a high frequency wave generating means for radiating high frequency energy into said heating cavity, a timer means for setting a heating time, and a cooking menu selecting means disposed on a front panel of said oven body including a rotatable scale having a plurality of menus printed thereon and a control know coupled to the rotatable scale for selecting one of said menus, the improvement comprising

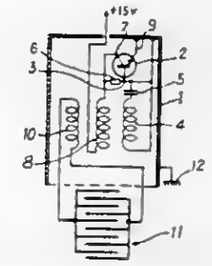
a high frequency wave output control means for controlling the magnitude of the output of said high frequency wave generating means, said high frequency output control means having a single switch operating rod being linked to a cam of said control knob of said cooking menu selecting means for effecting control of the output of said high frequency wave generating means in conjunction with the selection of a desired cooking menu, thereby generating an optimum high frequency wave output for the selected cooking menu.

4,028,518

DEVICE FOR SUPERFICIALLY HEATING AN ADJACENT BODY

Georges Boudouris, Grenoble; Grégoire Kalopissis, Neuilly-sur-Seine; Jean-Luc Leveque, and Paul Roussopoulos, both of Paris, all of France, assignors to L'Oreal, Paris, France

Filed June 13, 1975, Ser. No. 586,748
Claims priority, application Luxembourg, June 18, 1974, 70345
Int. Cl.² H05B *9/04*
U.S. Cl. 219—10.81 **8 Claims**



1. Device for increasing the superficial temperature of a body such as the skin, which comprises a resonator including an electrically conductive jacket which is substantially closed in the electromagnetic sense of the term, a coil inside said jacket for emitting high frequency electromagnetic energy, coupling means for matching said high frequency energy to the resonant frequency of the resonator, and an applicator circuit connected to conduct the energy produced inside the jacket to an applicator located outside the jacket.

4,028,519

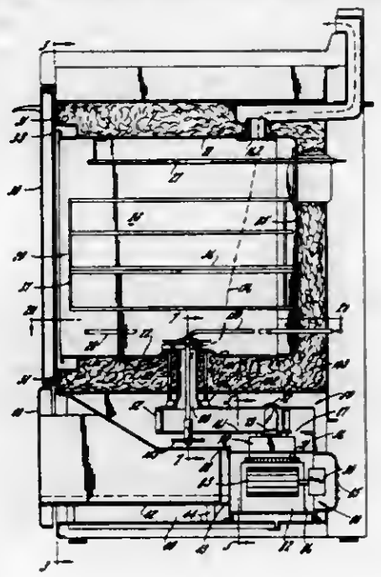
MODULAR POWER SUPPLY AND WAVEGUIDE CONSTRUCTION FOR MICROWAVE OVEN

Raymond Paul De Weese, Kankakee, Ill., and Beverly D. Kumpfer, Salt Lake City, Utah, assignors to Roper Corporation, Kankakee, Ill.

Filed Feb. 26, 1976, Ser. No. 661,564
Int. Cl.² H05B *9/06*
U.S. Cl. 219—10.55 B **18 Claims**

1. In a combined microwave-thermal range the combination comprising a frame having walls defining a rectangular oven cavity and an adjacent space, doors for respectively enclosing the front surfaces of the cavity and the adjacent space, a thermal element in the cavity, the walls of the cavity being insulated, the bottom wall of the oven cavity having an opening, a microwave module including a microwave power supply housing of generally rectangular shape arranged in the adjacent space, a magnetron and blower in the housing, the module including a waveguide of rectangular cross section having one end secured to the top of the housing and having its other end extending cantilever-fashion under the bottom wall of the cavity, the waveguide having an inlet alined with the magnetron and an outlet alined with the opening in the cavity, a hollow, open-ended conductor extending through the opening for coupling the outlet of the waveguide to the cavity, means

for securing the upper end of the hollow conductor to the bottom wall of the cavity and the lower end of the conductor to the waveguide, the hollow conductor being readily disengageable from the waveguide, and the module being disengageably secured in seated position and dimensioned for removal intact through the front surface of the adjacent space for replacement by a new module should servicing become necessary.



4,028,520

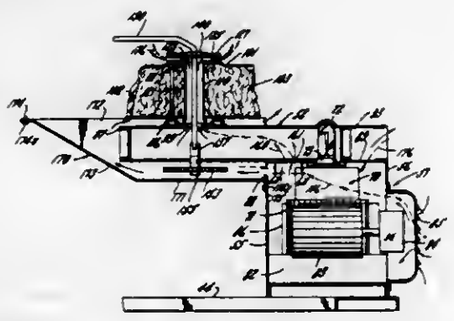
AIR FLOW SYSTEM FOR COMMON CAVITY MICROWAVE OVEN

Sumner H. Torrey, West Lafayette, Ind., assignor to Roper Corporation, Kankakee, Ill.

Filed Feb. 26, 1976, Ser. No. 661,524

Int. Cl.² H05B 9/06

U.S. Cl. 219—10.55 B **7 Claims**



1. In a combined microwave-thermal range, the combination comprising a frame having walls defining a rectangular oven cavity and a lower space, a door enclosing and sealing the front surface of the cavity against passage of air and microwave energy, a thermal element in the cavity, control means for operation of the thermal element at a normal temperature level for food preparation and at a high level for a self-cleaning mode, the walls of the cavity being insulated, the bottom wall of the cavity having an inlet opening, means defining a cavity air vent at the top of the cavity, a microwave power supply including a blower and a magnetron having cooling fins, the blower having a blower inlet for drawing in cooling air and an outlet for supplying such air under slight pressure to the cooling fins, a waveguide having an inlet connected to the magnetron and extending under the bottom wall of the cavity to terminate at an outlet, means for connecting the outlet of the waveguide to the inlet opening of the cavity for conduction of microwave energy into the cavity, means defining air passages of limited cross section for conducting air from the magnetron into the waveguide so that a portion of the pressurized air passes through the waveguide and into the cavity for ventilating the cavity when the magnetron and blower are turned on, the blower inlet being located at a lever below the bottom wall of the cavity so that when the blower and magnetron are turned off and the thermal element is turned on air is thermally convected from the blower inlet through the air passages into the waveguide and into the cavity for exiting through the cavity air vent notwithstanding the auto ignition pressure which exists in the cavity under high temperature self-cleaning conditions, the convention path of the air being sufficiently constricted so that air is convected in the self-cleaning mode at a level below that which is capable of producing an explosive reaction with the products of decomposition.

4,028,521

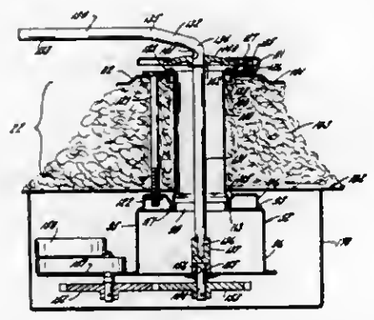
ANTENNA CONSTRUCTION FOR MICROWAVE OVEN

Frederick K. Uyeda, Attica, and Buddy J. Austin, Lafayette, both of Ind., assignors to Roper Corporation, Kankakee, Ill.

Filed Feb. 26, 1976, Ser. No. 661,543

Int. Cl.² H05B 9/06

U.S. Cl. 219—10.55 F **16 Claims**



1. In a microwave oven the combination comprising conductive walls and a conductive door defining an enclosed cavity, one of the walls having an opening, a source of microwave energy including a waveguide extending adjacent the said one wall, a hollow open-ended conductor penetrating the wall registering with the opening at one end and in communication with the waveguide at the other to propagate an inertial wave in the cavity, an antenna projecting into the hollow conductor, the antenna being formed of a rod having a straight shank portion and a radially extending arm portion arranged approximately perpendicularly thereto with an angled transitional portion in between bearing an obtuse angle with respect to each of them, the antenna thereby radiating a guided wave in the cavity in a direction different from the inertial wave, the transitional portion having a length at least equal to the radius of the hollow conductor and the radial arm portion having a length of at least that of the transitional portion, a rotatable mount for supporting the shank portion of the antenna substantially centered in the hollow conductor so that the transitional portion is spaced inwardly of the associated wall, and means including a driving motor coupled to the mount for rotating the antenna so that the guided wave is cyclically swept throughout the cavity superimposed upon the field of the inertial wave for improved energy distribution in the cavity and relative freedom from hot spots.

4,028,522

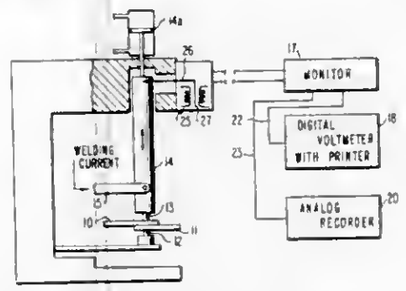
MULTI-MODE STRUCTURAL WELD MONITOR ON A TIME BASE

Russell Alexander Chihoski, and John Charles De Fellippie, both of Littleton, Colo., assignors to Martin Marietta Corporation, Rockville, Md.

Filed Apr. 29, 1975, Ser. No. 572,768

Int. Cl.² B23K 11/24

U.S. Cl. 219—109 **10 Claims**



1. A method of measuring a plurality of characteristics of a weld during a welding process in which a workpiece is clamped between two welder electrodes, one of which is movable to permit a change in electrode separation due to a dimensional change of the weld in the workpiece during a weld cycle, said method comprising:

selecting a plurality of predetermined time brackets within an individual weld cycle such that each bracket corresponds to one of the characteristics; and

measuring the change in electrode separation during each of said time brackets, whereby each measurement represents an indication of a weld characteristic for its corresponding time bracket.

4,028,523

ENERGY-BEAM ENGRAVING METHOD AND AN APPARATUS FOR CARRYING IT OUT

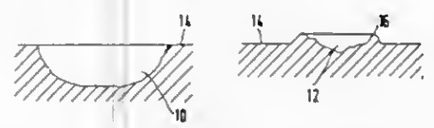
Peter Anderl; Monika Geffcken, and Joachim Geissler, all of Munich, Germany, assignors to Steigerwald Strahltechnik GmbH, Germany

Filed Dec. 9, 1975, Ser. No. 639,127

Claims priority, application Germany, Dec. 10, 1974, 2458370

Int. Cl.² B23K 9/00

U.S. Cl. 219—121 EM **4 Claims**



1. A method of energy beam engraving a workpiece having a workpiece surface comprising the following steps: directing an energy beam successively onto a plurality of discrete positions on said workpiece surface, said energy beam being adapted to produce a depression in said workpiece surface the depth and area of which increases with increasing dwell time, controlling the dwell time each position so as to produce smaller depressions and larger depressions, focusing said beam in a focus plane which lies within said workpiece in the vicinity of said workpiece surface, and controlling the focus of said beam so that said focus plane is nearer to the surface during production of said smaller depressions than during production of said larger depressions.

4,028,524

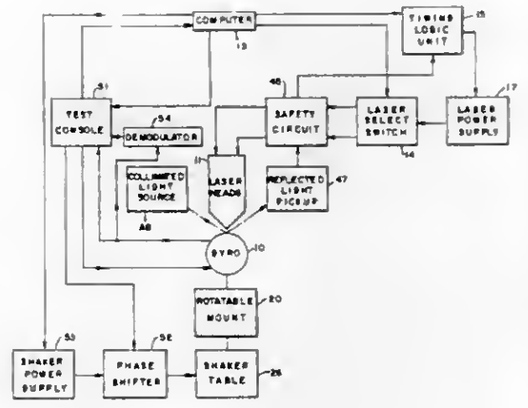
BALANCING SYSTEM FOR A ROTATING MASS

Dean H. Moll, Wayne, and Alan Greiner, Cedar Grove, both of N.J., assignors to The Singer Company, Little Falls, N.J.

Division of Ser. No. 483,149, June 26, 1974, Pat. No. 3,935,746, which is a division of Ser. No. 169,661, Aug. 6, 1971, Pat. No. 3,795,784. This application Apr. 24, 1975, Ser. No. 571,482

Int. Cl.² B23K 26/00

U.S. Cl. 219—121 L **1 Claim**



1. A method of balancing a free rotor gyroscope having a flywheel mounted for rotation about a spin axis and for pivotal displacement with respect to a pivotal plane perpendicular to the spin axis, comprising the steps of measuring the mass unbalance, radial unbalance and modulation of the spinning flywheel, and selecting and executing the following laser burn patterns based on the presence and absence of predetermined combinations of excess modulation, mass unbalance and radial unbalance:

a. aiming and firing a predetermined number of laser beam bursts at a single point on the circumference of the flywheel on one side of the pivotal plane depending on the sign of mass unbalance and at an angular location corresponding to the radial unbalance when an excess radial unbalance and an excess mass unbalance have been detected;

b. aiming and firing a predetermined number of pairs of laser beam bursts 180° apart from each other on opposite sides of the circumference of the flywheel on the same one side of the pivotal plane and equidistant therefrom depending on the sign of the mass unbalance when only an excess mass unbalance has been measured;

c. aiming and firing a predetermined number of pairs of laser beam bursts located at the same angular position on the circumference of the flywheel corresponding to the radial unbalance above and below the pivotal plane and equidistant therefrom when only an excess radial unbalance has been measured; and

d. aiming and firing a predetermined number of pairs of laser beam bursts located 180° apart from each other on opposite sides of the circumference of said flywheel and on opposite sides of said pivotal plane and equidistant therefrom at angular locations corresponding to the modulation unbalance when an excess modulation unbalance has been measured.

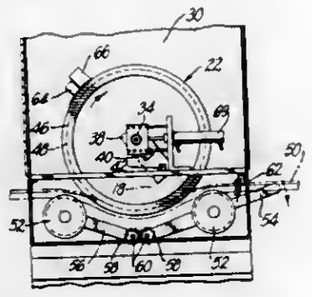
4,028,525
APPARATUS FOR CREATING HOLES IN FLEXIBLE MEMBERS

David E. Mominee, Alpine, and Gilbert W. Vance, Jamul, both of Calif., assignors to Reed Irrigation Systems, El Monte, Calif.

Continuation of Ser. No. 460,812, April 15, 1974, abandoned, which is a division of Ser. No. 239,921, March 31, 1972, Pat. No. 3,808,394. This application Nov. 6, 1975, Ser. No. 629,494

Int. Cl.² H05B 9/00

U.S. Cl. 219—121 L 15 Claims



1. An apparatus for use in creating a hole in an elongated flexible member which comprises:
wheel means having a periphery;
means for mounting the wheel means for rotation;
holding means for holding at least a portion of the elongated flexible member with respect to said periphery so that there is substantially no relative movement between said portion of said flexible member and said wheel means as said wheel means rotates;
reflecting means for reflecting a laser beam;
first means for rotatably mounting said reflecting means for rotation in synchronism with said wheel means;
laser means for creating and directing a laser beam toward said reflecting means; and
said reflecting means being positioned relative to said laser means and said wheel means so that the laser beam emitted from said laser means is directed toward a specific area of said portion of said flexible member during rotation of said wheel means through an arc with the laser beam intersecting said specific area at a first angle, said first angle being constant for the period that the wheel means rotates through said arc.

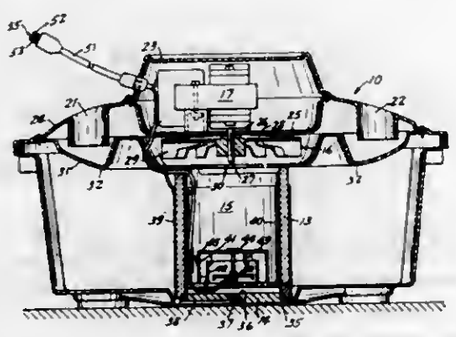
4,028,526
ELECTRICALLY GROUNDED VAPORIZER STRUCTURE

George W. Schossow, 2316 Lilac Lane, White Bear Lake, Minn. 55110

Continuation-in-part of Ser. No. 832,279, June 11, 1969, Pat. No. 3,809,374. This application Feb. 21, 1974, Ser. No. 444,337

Int. Cl.² H05B 1/02, 3/60; H02H 1/02; F22B 1/30

U.S. Cl. 219—295 16 Claims



1. A vaporizer for vaporizing water to steam and mixing the steam with air and dispensing a moist air below scalding temperature, said vaporizer comprising
a base defining a reservoir for liquid,
a plate supported in said base,
a cover supported on said base, said cover supporting a tubular member which has one end joined in abutting mating engagement with said plate to form a boiling chamber, an electrically driven fan supported in a manifold within said cover and in communication with the base and the boiling chamber to draw steam from said boiling chamber and air from said base into said manifold to be discharged therefrom through a discharge outlet, valve means permitting water to flow from said reservoir to said boiling chamber, and electrode heating means disposed in said boiling chamber to boil the water therein by electrical resistance of the water, and
an electrical circuit for energizing said electrode heating means and said fan, said circuit including a ground line for providing ground potential, an electrically energizable switching means for connecting said fan and the electrodes of said electrode heating means to a source of potential through a hot and neutral line respectively, a momentary contact switch connected in series with said hot line and said switching means for energizing said switching means, said circuit for said switching means, momentary contact switch, hot line and ground line being such that said switching means can be energized by said momentary contact switch only when ground potential is present to said circuit via said ground line, and a sensing member connected in series with said switching means and positioned in said base adjacent one of an element of said boiling chamber carrying current and an electrode of said electrode heating means disposed in said base to close said circuit including said switching means for holding said switching means energized only when there is water in said base above a predetermined minimum level to cover said sensing member for holding said fan and electrode heating means energized.

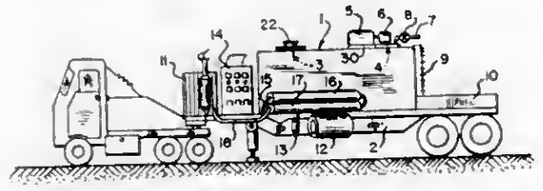
4,028,527
APPARATUS AND CONTROL SYSTEM FOR HEATING ASPHALT

George F. Thagard, Jr., 60 Linda Isle, Newport Beach, Calif. 92660

Filed Dec. 2, 1974, Ser. No. 528,732

Int. Cl.² F24H 1/18; H05B 1/00

U.S. Cl. 219—311 38 Claims



1. An apparatus for heating and maintaining an asphalt material to temperatures within a preselected range which comprises an enclosed vessel configured to contain the material in at least one of a solid and liquid state, inlet means for introducing the material into the vessel in at least one of a solid and liquid state, means for heating at least one of the wall portions of the vessel to maintain the temperature of at least one of the inner wall portions which contact the material therein and the material in the vessel above the melting temperature and below the decomposition temperature of the asphalt material, the surface area of heated wall portions contacting the material being sufficient to transfer heat to the material at least sufficient to maintain the temperature of the material to within said preselected range in a manner to avoid causing substantial decomposition thereof, control means for selectively controlling the temperatures of the heating means to maintain at least one of the inner wall portions of the vessel contacting asphalt material thereon and the asphalt material in the vessel within said preselected temperature range, venting means communicating an upper portion of the vessel with an atmosphere outside of the vessel, filtering means capable of filtering vapors such as condensible hydrocarbon vapors communicating with said venting means, and outlet means for removing the material from said vessel.

4,028,528
CODE SCANNING SYSTEM

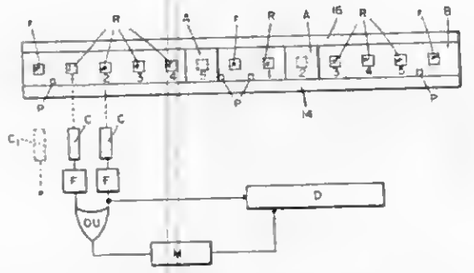
Daniel Staes, Bretigny sur Orge, France, assignor to Rapistan, Incorporated, Grand Rapids, Mich.

Filed Feb. 27, 1976, Ser. No. 662,005

Claims priority, application France, Feb. 28, 1975, 75.06486

Int. Cl.² G06K 7/10; G02B 5/12

U.S. Cl. 235—61.11 E 13 Claims



1. A code scanning system comprising:
a code strip including a plurality of spaced code elements arranged in a row and selectively obstructed to define a code,
a plurality of detectors positioned in a row aligned to permit serial scanning of said code strip when said code strip and said detectors are moved relative to one another said detectors spaced such that adjacent detectors are simultaneously aligned with adjacent code elements for detecting said code elements,
logic circuit means coupled to said detectors for providing a timing signal in response to the direction of a code element, and
circuit means coupled to one of said detectors and to said logic circuit for receiving signals therefrom representative of a code encoded in said code strip.

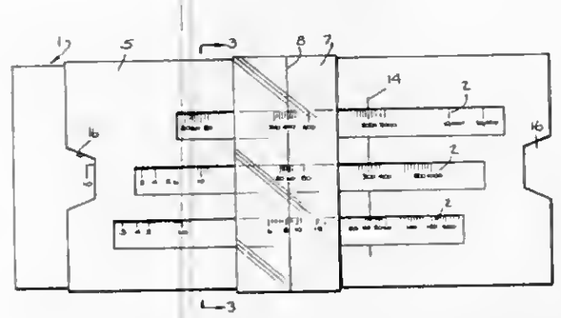
4,028,529
CURRENCY EXCHANGE CALCULATOR

George W. Van De Weghe, 477 Colonial Road, Ridgewood, N.J. 07450

Filed Aug. 28, 1975, Ser. No. 608,757

Int. Cl.² G06G 1/02

U.S. Cl. 235—89 R 7 Claims



1. A currency exchange calculator for simultaneously displaying the monetary unis of two currencies that are related by a conversion factor comprising: (a) a slide having a plurality of parallel quasi-logarithmic scales thereon with at least one said scale being laterally displaced relative to another of said scales by a predetermined factor of displacement not related to the conversion factor, (b) a sleeve slidably engaged about at least a portion of said slide and including means for exposing at least a portion of each of said quasi-logarithmic scales and said sleeve further including a sleeve index means for indexing the position of said sleeve relative to at least one of said scales, and (c) a cursor slidably engaged about at least a portion of said sleeve and including a cursor index means for indexing the position of said cursor relative to at least one of said scales.

4,028,530
COUNTING DEVICES

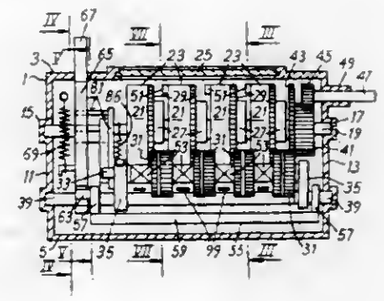
Hans Bud, London, and Peter Alway, Bushey, both of England, assignors to Hans Bud, London, England

Filed May 16, 1975, Ser. No. 578,342

Claims priority, application United Kingdom, May 22, 1974, 22945/74

Int. Cl.² G06C 15/42

U.S. Cl. 235—144 HC 8 Claims



1. A resettable counting device comprising:
coaxial number wheels;
a reset cam provided with each number wheel to rotate therewith;
a transfer pinion shaft displaceable relatively to the number wheels;
transfer pinions rotatably mounted on said shaft and disposed respectively intermediate successive number wheels, each pinion during counting operations of the device meshing with gear teeth on one of the number wheels adjacent thereto and engaging drive means on the other number wheel during rotation of said other number wheel thereby partially to rotate said one of the number wheels;
a cradle having parallel end members extending transversely with respect to the number wheel axis, a longitudinal member connected therebetween, and first and second abutment means;
reset fingers supported on said longitudinal member of the cradle so as to be out of contact with the reset cams during counting operations and to be together rotatable about a common axis to engage respectively with the reset cams to reset the number wheels;
a reciprocably movable actuating member adapted during movement thereof in one sense to effect displacement of the transfer pinion shaft thereby to disengage the transfer pinions from the number wheels and subsequently to engage said first abutment means thereby rotating said reset fingers and adapted upon movement in the reverse sense to be repositioned for subsequent resetting operations; and
flexible members disposed to be out of contact with the transfer pinions during counting operations and located so as to be engaged respectively by the transfer pinions subsequent to the disengagement thereof from the number wheels thereby to reorientate the transfer pinions, and so as to be engaged subsequently by said second abutment means upon rotation of the reset fingers, the

engagement with the second abutment means serving to stress the flexible members so that contact between the pinions and the flexible members is maintained until remeshing of the pinions with the number wheels takes place, the flexible members thereafter disengaging from the pinions.

4,028,531

SYSTEM FOR DISPLAYING INFORMATION ABOARD A MOVING OBJECT

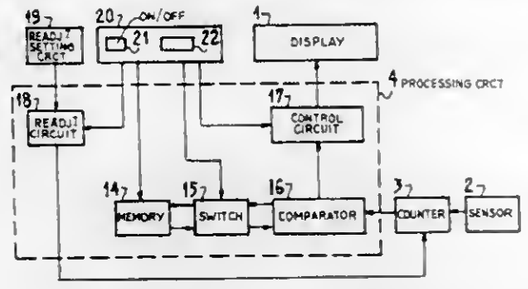
Jean Cottin, and Jean Laxague, both of Paris, France, assignors to Thomson-CSF, Paris, France

Filed Nov. 20, 1975, Ser. No. 633,865

Claims priority, application France, Nov. 21, 1974, 74.38280

Int. Cl.² G06F *15/20;* **G09B** *29/10*

U.S. Cl. 236—150.2 **12 Claims**



1. A system for giving positional information to passengers aboard a vehicle traveling between a starting point and a terminal point over a route including a plurality of transit points, comprising:

memory means for storing numerical data corresponding to the lengths of sections of said route extending between said points;

odometric means on said vehicle for continuously registering the distance traveled from a reference point on said route;

display means on said vehicle for visually indicating to its occupants the current position of the vehicle with reference to said points, said display means including a plurality of markers individually assigned to said transit and terminal points;

comparison means provided with first and second inputs respectively coupled to said memory means and to said odometric means for generating a control signal upon the data on said inputs matching each other;

sequencing means connected to said comparison means for calling forth from said memory means, at said reference point, the stored data relating to the length of the first route section still to be traveled and for thereafter calling forth, in response to control signals emitted by said comparison means, the stored data relating to the lengths of successive route sections for transmission to said first input; and

circuit means connected between said comparison means and said display means for activating, in response to said control signal, the marker indicatng a point at the end of the route section to be traveled next.

4,028,532

TURBINE SPEED CONTROLLING VALVE OPERATION

John F. Reuther, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Continuation of Ser. No. 247,888, April 26, 1972, abandoned. This application Nov. 2, 1973, Ser. No. 412,513

Int. Cl.² F01D *19/00*

U.S. Cl. 235—151.1 **27 Claims**

1. A system for operating a turbine in which an elastic fluid imparts rotation to the turbine, comprising

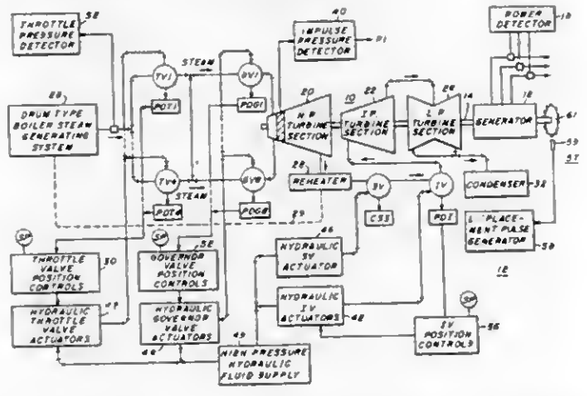
valve means for controlling the flow of elastic fluid to the turbine,

means for controlling the valve means in accordance with a desired turbine speed,

means for generating a first series of pulses at a rate proportional to the rotational speed of the turbine,

means for generating a second series of pulses at a predetermined rate, which rate is substantially greater than the generated rate of the first series at the upper range of turbine speed,

means to count the number of pulses of the first series during a predetermined time interval,



means to count the number of pulses of the second series during the generation of a predetermined number of pulses of the first series,

means to generate a first signal corresponding to the counted number of the first series of pulses,

means to generate a second signal corresponding to the counted number of the second series of pulses,

means governed by a predetermined rotational speed of the shaft and the count of the first and second series of pulses to select one of the first and second signals, and

means to operate the valve control means in accordance with the selected one of the first and second signals.

4,028,533

ROBOT MOVABLE IN A GROUP

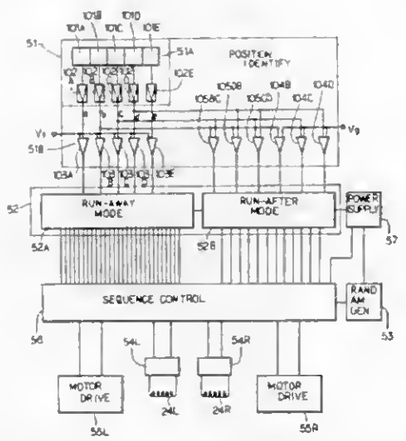
Sueo Matsubara, Tokyo, Japan, assignor to Techno-Venture Co., Ltd., Japan

Filed Dec. 29, 1975, Ser. No. 644,469

Claims priority, application Japan, Dec. 31, 1974, 50-3345; Dec. 31, 1974, 50-3346; Dec. 31, 1974, 50-3347; Dec. 31, 1974, 50-3348

Int. Cl.² B26D *1/02*

U.S. Cl. 235—151 **33 Claims**



1. Robots movable in a group, each of said robots being movable in one of at least two different modes of movement at a time and comprising:

identifying means for identifying the relative positions between this robot and the other robots of the group and for thereby generating a position signal representing the relative positions between said this robot and said the other robots of the group;

mode control means operatively associated with said identifying means for selecting one mode at a time out of said at least two different modes in accordance with said position signal received from said identifying means and for thereby generating a mode signal corresponding to said selected mode; and

moving means operatively associated with said mode control means for receiving said mode signal and for thereby actuating said this robot to move in one of said at least two modes which is selected by said mode control means.

4,028,534

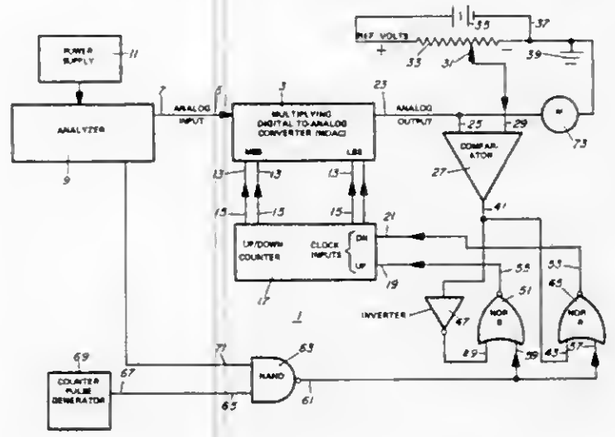
AUTOMATIC SPAN CIRCUIT

Huel C. Tucker, Centerville, Ohio, assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Apr. 14, 1976, Ser. No. 676,951

Int. Cl.² G06F *15/20;* **G06J** *1/02*

U.S. Cl. 235—151.35 **9 Claims**



1. An automatic gain control system comprising:

a multiplying digital-to-analog converter having an analog voltage input, an analog voltage output, and N digital input channels, where N is an integer greater than one, and having the characteristic that its analog output is a linear function of the product of its analog input and its digital input;

a binary UP/DOWN counter having N digital counting channels connected, respectively, to said N converter channels, and UP/DOWN counting input means;

a fixed reference voltage source;

a voltage comparator having two inputs, one connected to the analog voltage output of said converter and the other connected to said reference voltage source, and a binary output;

means for generating a pulse train;

gate means, controlled by said binary output of said comparator, for connecting said pulse train generating means to said input means to cause said counter to count UP when the analog output voltage from said converter is less than the reference voltage and to count DOWN when the analog output voltage is greater than the reference voltage; and

a voltage-responsive meter, connected to said analog voltage output of said converter, calibrated to register the analog voltage input to said converter.

4,028,535

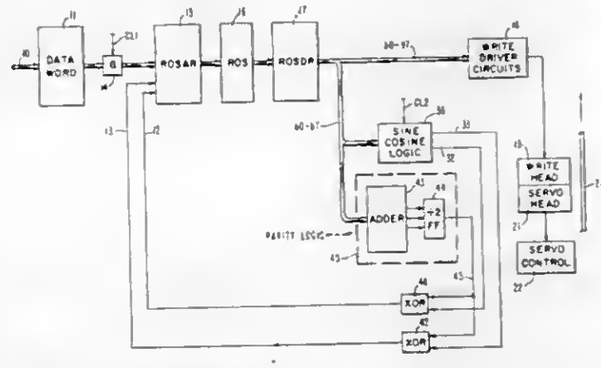
APPARATUS AND METHOD FOR GENERATING A DATA CODE WITH A SPECTRAL NULL

Peter Anthony Franaszek, Ossining, and David Allen Thompson, Somers, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed June 11, 1976, Ser. No. 695,295

Int. Cl.² G06F *13/04, 7/38, 15/34*

U.S. Cl. 235—152 **7 Claims**



1. In a code signaling system,

translating means for translating coded data to provide a spectral null at a predetermined frequency including an addressable translating apparatus for providing a coded output signal in response to a coded input signal,

monitoring means for monitoring the output signals from said translating apparatus with respect to predetermined limit conditions for providing code selection data as a function of said output signals,

said monitoring means having an output connected to supply said code selection data to modify the input signal to said translating means whereby said spectral null is achieved at said predetermined frequency.

4,028,536

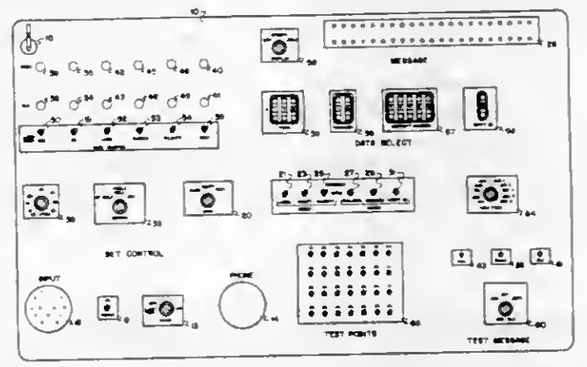
SNAIAS DIGITAL DATA TEST SET

John William Woodward, Virginia Beach, Va., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Feb. 27, 1976, Ser. No. 661,901

Int. Cl.² H04B *3/46, 17/00;* **G08C** *25/00*

U.S. Cl. 235—153 A **20 Claims**



1. A portable Ship's Navigation Aircraft Inertial Alignment System Digital Test Set which evaluates the availability and adequacy of the data link navigation messages, transmitted between the shipboard navigation system and the aircraft inertial alignment system via a digital data radio link, umbilical cable or both, comprising:

power distribution circuitry which develops and distributes power signals throughout said test set;

timing circuitry which produces timing signals that control the processing of received data;

display circuitry which source selects and receives cable

data, transmitted RF data or both, checks the adequacy of the data for a sample period, displays a good or bad data evaluation, shapes, aligns and gates said data into a serial digital signal, converts said digital signal into a parallel data signal and provides semi-permanent storage to display data; and,

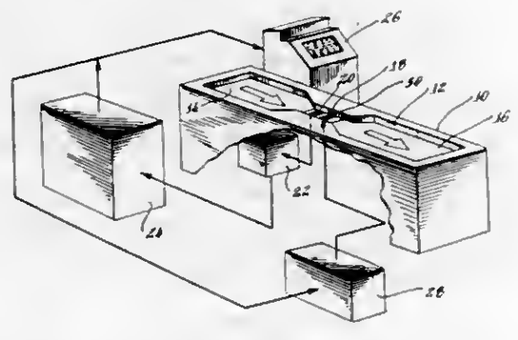
data check circuitry which decodes the operating mode, alignment or waypoint, of said test set, evaluates the received data, checks each message for a sample period for correct lable, parity, validity and alignment sublabel update rate in the alignment mode, checks each message for a sample period for correct label, parity, aircraft address, waypoint number and waypoint sublabel update rate in the waypoint mode, and instructs said display circuitry as to the overall adequacy of the data.

4,028,537

PRODUCT PROCESSING SYSTEM WITH PRICE PRINTER

John E. Snow, Minneapolis, Minn., assignor to Champion International Corporation, Stamford, Conn.

Filed Mar. 31, 1976, Ser. No. 672,055
Int. Cl.² G06K *3/02, 19/06*
U.S. Cl. 235—61.9 R **3 Claims**



1. A product check out system comprising:

a. a checkout stand including therein an automatic label reader means disposed on an upper surface thereof, said label reader means being capable of reading a plurality of universal product codes carried on said products and generating product-identifying signals corresponding thereto as each product is moved pass said label reader;

b. computer means responsive said product-identifying signals for generating price signals as a function of product prices currently stored in the memory of said computer;

c. register means for totalling said price generated in the course of processing an aggregation of products; and

d. printing means disposed in close proximity to said label reader means for printing visual representations of the price on said product in accordance with said price signals.

4,028,538

PROGRAMMABLE CALCULATOR EMPLOYING ALGEBRAIC LANGUAGE

Emil Edward Olander, Jr., Fort Collins; Rex L. James, Loveland; Ivar W. Larson, Loveland; Wayne F. Covington, Loveland; Jack M. Walden, Loveland; Robert E. Watson, Loveland; Francis J. Yockey, Loveland; Fred Wenninger, Jr., Loveland, and Homer C. Russell, Berthoud, all of Colo., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Division of Ser. No. 212,581, Dec. 27, 1971, Pat. No. 3,839,630. This application Sept. 30, 1974, Ser. No. 510,921
Int. Cl.² G06F *7/38, 15/02*
U.S. Cl. 235—156 **20 Claims**

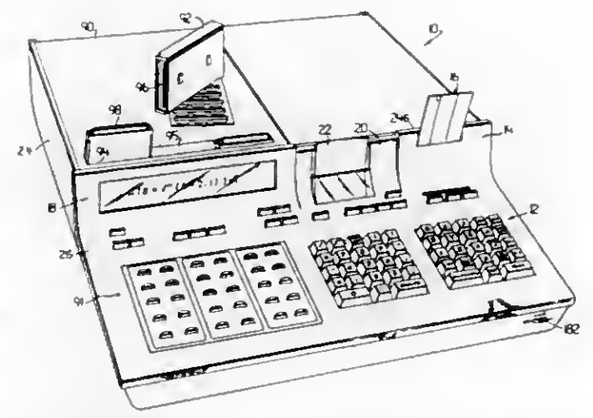
1. An electronic calculator comprising:

keyboard input means including a plurality of keys for entering lines of one or more alphameric statements each into the calculator;

buffer storage means, coupled to said keyboard input means, for storing each line of one or more alphameric statements as it is entered into the calculator from said keyboard input means;

memory means, coupled to said buffer storage means, for storing lines of one or more alphameric statements each entered into the calculator;

processing means, coupled to said keyboard input means, buffer storage means, and memory means, for selectively processing either a line of one or more alphameric statements entered into the calculator and stored in said buffer storage means or lines of one or more alphameric statements stored in said memory means to perform selected functions; and



output means, coupled to said buffer storage means and said processing means, for providing an output indication of selected functions performed by the calculator;

said keyboard input means including an execute control key for initiating execution of a line of one or more alphameric statements by said processing means, and a store control key for initiating storage of a line of one or more alphameric statements in said memory means; and

said processing means being responsive to actuation of said execute control key, following entry of a line of one or more alphameric statements into said buffer storage means, for executing that line of one or more alphameric statements, and being responsive to actuation of said store control key, following entry of a line of one or more alphameric statements into said buffer storage means, for storing that line of one or more alphameric statements in said memory means.

4,028,539

MEMORY WITH ERROR DETECTION AND CORRECTION MEANS

Pieter Anton Jacobs, Apeldoorn, Netherlands, assignor to U.S. Phillps Corporation, New York, N.Y.

Filed Nov. 20, 1975, Ser. No. 633,575
Claims priority, application Netherlands, Dec. 9, 1974, 7415966
Int. Cl.² G06F *11/00;* **G11C** *29/00*
U.S. Cl. 235—153 AM **2 Claims**

1. A memory comprising:

a first plurality of memory units, a first input address line connected to said memory units for delivering a first partial address thereto, said first plurality of memory units having valid partial addresses in a first partial address sequence from a specified first to a specified second memory unit;

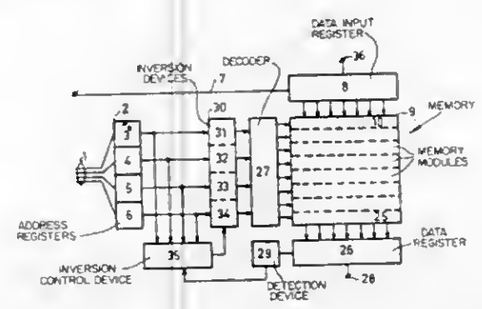
a second input address line connected to said memory units for addressing individual bits of one of said memory units;

a data input register connected to said plurality of memory units;

a data output register connected to said plurality of memory units;

a detection device connected to said data output register for detecting a non correctable storage error and producing an output signal;

an inversion device connected to said first input address line for inverting predetermined address bits, thereby allowing addressing of said first plurality of memory units in a second partial address sequence starting from a third memory unit;



an inversion control device, having an input connected to said detection device, and an output connected to said inversion device for activating said inversion device; and

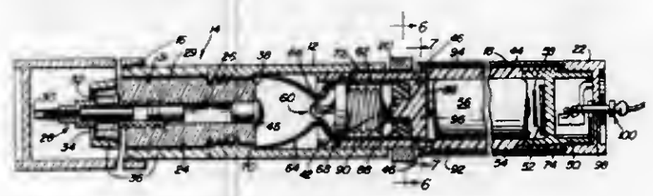
blocking means for blocking addressing of ones of a second plurality of memory units beyond a predetermined fourth memory unit, said blocking means and said inversion control device being linked for blocking addressing of a faulty memory unit in said second plurality of memory units.

4,028,540

FLASHLIGHT MARKING IMPLEMENT

Columbus B. Key, Jr., 49 New York Ave. NW., Washington, D.C. 20001, and Vincent M. Spaulding, 2914 W St. SE., Washington, D.C. 20020

Filed Nov. 11, 1975, Ser. No. 630,885
Int. Cl.² B43K *5/12;* **F21Y** *33/00*
U.S. Cl. 240—6.46 **9 Claims**



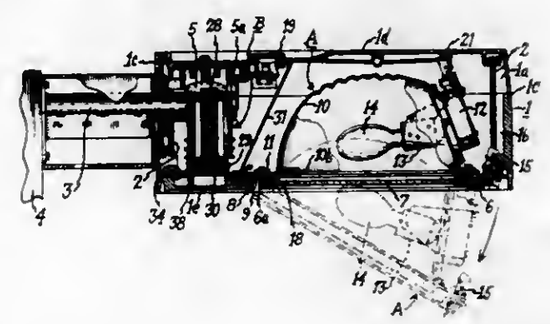
8. An illumination implement comprising an elongated tubular body having a light emitting end section and an opposite end section enclosing a source of illumination, a housing having a tubular end portion projecting into the opposite end section of the tubular body and a protective portion enclosing an internal source of electrical energy in axially spaced relation to the tubular body, energizing circuit means carried on the housing for conducting electrical energy from said internal source to the source of illumination, and switch means mounted on the tubular end portion of the housing axially between the tubular body and the protective portion of the housing for selectively connecting the internal source to the source of illumination through the circuit means.

4,028,541

LUMINAIRE

John S. Franklin, Hendersonville, N.C., assignor to General Electric Company, New York, N.Y.

Filed Nov. 11, 1974, Ser. No. 522,439
Int. Cl.² F21S *1/10, 3/10, 13/10*
U.S. Cl. 240—25 **4 Claims**



1. A luminaire comprising, in combination, a housing having a top wall, opposite side walls, a front wall and a rear wall defining a housing chamber and a bottom wall extending forwardly from said rear wall covering a portion of said housing chamber and defining with said side walls and said front wall a bottom opening at the front portion of said housing chamber, and a combined closure and optical assembly arranged in said front portion of said housing chamber detachably secured to said housing for movement as a unit to a closed operative position covering said bottom opening and an open inoperative position away from said bottom opening, said combined closure and optical assembly comprising a concave reflector, a light transmitting member and frame means joined together and defining an optical enclosure, said concave reflector having a front side formed with an aperture, and combined lamp holder and cover means detachably mounted on said reflector covering said front aperture therein and having lamp support means extending through said front aperture for holding a lamp within said optical enclosure, said front aperture being sufficiently large for passage of the lamp therethrough so that said lamp support means with lamp attached thereto is removable as a unit from said optical enclosure upon detachment from said reflector, and coacting separable electric connecting means on said housing and said combined closure and optical assembly adjacent said front wall for automatically making and breaking electrical connection between the lamp and an electrical supply upon respectively closing and opening said combined closure and optical assembly.

4,028,542

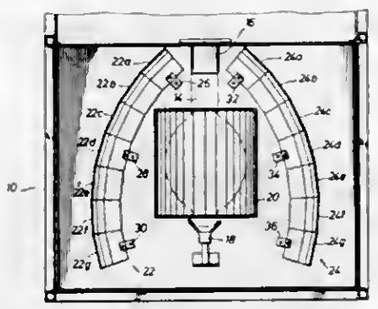
FACETED PARABOLIC-TYPE REFLECTOR SYSTEM

Glen Harold McReynolds, Jr., Houston, Tex., assignor to Esquire, Inc., New York, N.Y.

Continuation-in-part of Ser. No. 505,140, Sept. 11, 1974, abandoned. This application Apr. 16, 1975, Ser. No. 568,725
Int. Cl.² F21V *7/09*
U.S. Cl. 240—41.36 **7 Claims**

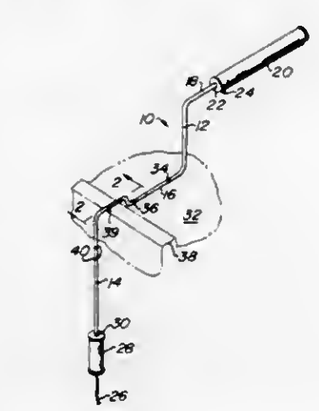
1. A luminaire adaptable for securing therein a light source through which an optical axis passes, and having an opening through which light from the source is emitted, including a reflector having a plurality of substantially contiguous planar segments, said segments forming a part of a circular arc in a plane behind the source and parallel to the opening to one side

of the axis, said arc approximating a parabolic shape with the center of the source at its focus, said reflector parabolically



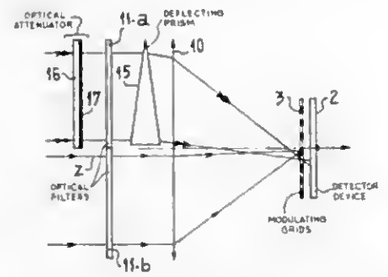
positionable with respect to said source so as to change the reflected beam angle through the opening.

4,028,543
BASELESS LAMP
Joseph Oster, Allentown, Pa., assignor to Keystone Lamp Manufacturing Corporation, Slatington, Pa.
Filed Mar. 3, 1976, Ser. No. 663,320
Int. Cl.² F21V *21/08, 21/20;* **A47G** *29/30*
U.S. Cl. 240—52.1 **6 Claims**



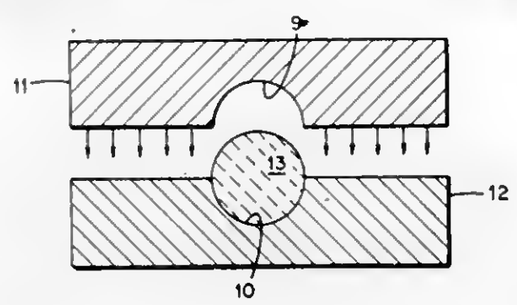
1. A lamp comprising:
an elongated tubular support member;
said support member having a substantially downwardly extending portion, a substantially upwardly extending portion spaced from said downwardly extending portion and a substantially horizontally extending portion connected between the lower end of said upwardly extending portion and the upper end of said downwardly extending portion;
friction means covering at least part of at least the underside of said horizontally extending portion, said friction means being adapted to rest on a support surface for supporting said lamp;
a lamp fixture mounted on said upwardly extending portion of said support member adjacent the upper end thereof; and
a counterweight means mounted on said downwardly extending portion of said lamp support adjacent the lower end thereof, the weight of said counterweight means being such that the center of gravity of the lamp is below said horizontally extending portion whereby said lamp is balanced in a substantially upright position when said friction means is resting on a support surface.

4,028,544
RADIANT ENERGY DETECTION SYSTEM
Francis Jourdan; Georges Couderc, and Serge Ediar, all of Paris, France, assignors to Thomson-CSF, Paris, France
Filed Apr. 5, 1976, Ser. No. 673,818
Claims priority, application France, Apr. 7, 1975, 75.10741
Int. Cl.² G01J *1/20*
U.S. Cl. 250—203 R **9 Claims**



1. In a radiant energy system for discriminating between radiation from a target and ambient radiation, the combination of: optical receiver means comprising an optical objective for focusing the said radiation originating from an observed field, an optical splitter device for producing two optical channels, a first optical filter in a first of said channels having a pass-band corresponding substantially to the said target radiation spectrum, a second optical filter in the second of said channels having a pass-band corresponding to a portion of the said ambient radiation spectrum and outside the target spectrum and optical attenuating means for balancing the ambient radiation levels in the two channels; reticle means for modulating the focused radiation by means of grids comprising, in a plane, transparent zones separated by opaque zones said grids being moved substantially in the focal plane of said optical objective in a direction transverse to that of the optical axis of said objective; photodetection means behind said reticle means for detecting the modulated and filtered radiation and a circuit for processing the detected signals; the said optical splitter device producing in combination with said objective two images of the said field, one for each channel, which are staggered in the plane of the grids in the said direction by an amount substantially equal to the diameter of the target image, the dimension of the said zones in this direction being a multiple of and at least equal to this diameter.

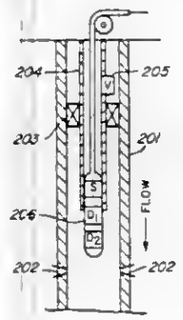
4,028,545
METHOD OF SIMULATING SPHERICAL VOIDS FOR USE AS A RADIOGRAPHIC STANDARD
Billy E. Foster, Oak Ridge, Tenn., assignor to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.
Filed Feb. 17, 1976, Ser. No. 658,806
Int. Cl.² G01D *18/00*
U.S. Cl. 250—252 **2 Claims**



1. A method of providing radiographic standards for weld voids comprising the step of radiographing a bead of low atomic number material of a desired size which bead is encased in etched, identical, opposing hemispheres of two plates

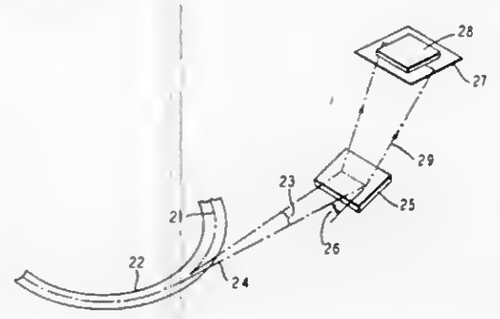
of welding material bonded together, said bead being at a first given distance from an X-ray film, and repeating the above step a plurality of respective times using various other proportional distances between the bead and other X-ray films, whereby the resulting radiographs serve as standards for use in quality control comparisons of voids in actual welds.

4,028,546
BEHIND WELL CASING WATER FLOW DETECTION SYSTEM
Harold E. Peelman, and Oble M. Langford, both of Houston, Tex., assignors to Texaco Inc., New York, N.Y.
Filed Nov. 3, 1975, Ser. No. 628,172
Int. Cl.² G01V *5/00*
U.S. Cl. 250—266 **12 Claims**



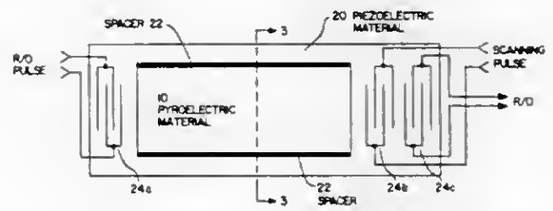
1. Apparatus for detecting undesired behind casing water flow in a producing well comprising:
a modular downhole sonde assembly sized and adapted for passage through a cased well borehole, said modular assembly being fluid tight and pressure resistant when assembled and having at least three modules comprising a first module housing a source of high energy neutrons capable of providing a flux of high energy neutrons at least some of which have energy sufficient to cause the nuclear reaction O^{16} (n,p) N^{16}, a second module housing at least two longitudinally spaced gamma ray detectors and a neutron shielding means for reducing direct irradiation of said detectors ' y said source, and a third module housing control and signal transmission electronic systems for controlling said source or said detectors and for transmitting signals from said sonde to and from surface equipment, said first and second modules being arranged so that they may be connected to each other in end to end relationship with either said first module or said second module above said first module while maintaining approximately the same longitudinal spacing between said source and said detectors.

4,028,547
X-RAY PHOTOLITHOGRAPHY
Peter Michael Eisenberger, Morristown, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.
Filed June 30, 1975, Ser. No. 591,695
Int. Cl.² H01J *37/00*
U.S. Cl. 250—272 **3 Claims**



1. Method of photolithographic processing comprising directing a beam of electromagnetic radiation in the wavelength range 1 A to 50 A through a shadow mask, against a device precursor consisting of a substrate and an image forming layer, sensitive to the radiation, producing a change in the cohesiveness of the irradiated portion of the layer **CHARACTERIZED IN THAT** the radiation is directed against the device precursor by means of Bragg reflection from an inhomogeneously reflecting crystalline body, which inhomogeneously reflecting crystalline body consists of a multitude of crystallites whose angular spread of crystalline orientation is from 10^{-4} radians to 10^{-1} radians of angle, which radiation is synchrotron radiation and which crystalline body is shaped so as to compensate for the angular deviation of the synchrotron radiation and produce a more nearly parallel beam.

4,028,548
IR IMAGING WITH SURFACE WAVE READOUT
Marion L. Scott, Ridgecrest, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.
Filed Mar. 29, 1976, Ser. No. 671,234
Int. Cl.² H01J *31/49*
U.S. Cl. 250—330 **8 Claims**

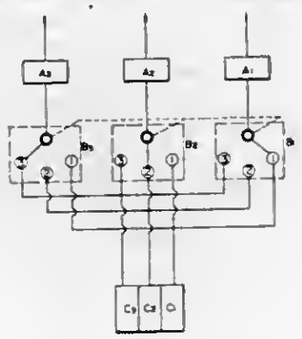


1. A device for IR imaging with surface wave readout comprising:
a pyroelectric stratum which is doped with an impurity to obtain a free carrier concentration in said stratum the free carriers being repelled from the surface of said stratum by a surface charge to form a depletion layer, the density of said surface charge being a function of the temperature of the incident radiation from an IR image;
a piezoelectric substrate parallel to the pyroelectric stratum and separated from it by spacers;
first means for propagating a first acoustic surface wave in the piezoelectric substrate, said wave transversing the substrate such that the electric field of the wave penetrates the pyroelectric stratum;
second means for propagating a second acoustic surface wave in the piezoelectric substrate, said second means located at the opposite end of the substrate from the first means so that second acoustic surface wave travels in the opposite direction from the first acoustic surface wave so as to amplitude modulate the first wave; and
output means for observing the amplitude modulated first wave after it has transversed the pyroelectric stratum located at the same end of the piezoelectric substrate as the second propagating means.

4,028,549
SYNCHRONIZED ACCUMULATING RADIODETECTOR
Shigeo Baba, 7649 Fuchu, Tokyo 183, Japan
Filed Dec. 8, 1975, Ser. No. 638,631
Claims priority, application Japan, Dec. 6, 1974, 49-140719
Int. Cl.² G01T *1/18*
U.S. Cl. 250—336 **1 Claim**

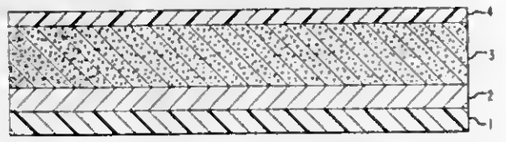
1. A synchronized accumulating radiodetector comprising of a series of counting tubes of equal inner volume, a switching assembly synchronizing with the flow speed of radioactive substance traveling through or along side of said counting tubes, counting accumulators for the detected radioactivity

and an associated output system, wherein said counting tubes are longitudinally connected to each other at a fixed distance



and said switching assembly is composed of a series of switching devices each provided at the corresponding counting tube.

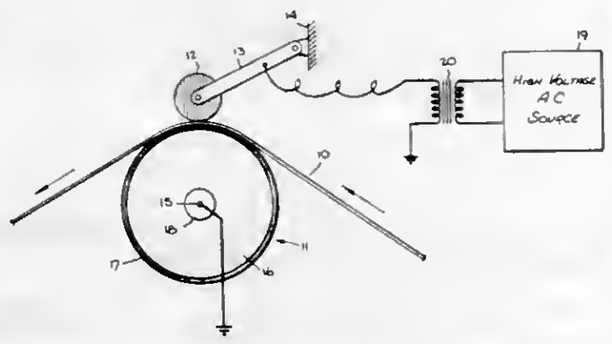
4,028,550
X-RAY SCREENS
James Paul Weiss, Westfield, N.J., and Edward Dyal Smith, Towanda, Pa., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.
Filed Dec. 22, 1975, Ser. No. 642,714
Int. Cl.² H01J 1/62; C09K 11/12
U.S. Cl. 250—483 **12 Claims**



1. A luminescent composition comprising a mixture of a europium-activated barium fluorohalide phosphor and an aminocoumarin brightening agent in a binder.

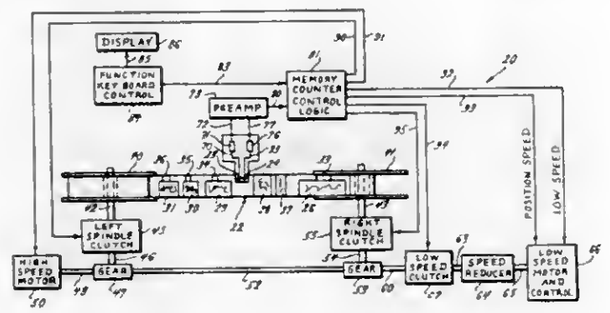
5. An X-ray screen comprising a support bearing a thin layer of europium-activated Ba fluorohalide phosphor mixed with an aminocoumarin brightening agent and dispersed in a film-forming binder.

4,028,551
APPARATUS AND METHOD FOR CORONA DISCHARGE PRIMING A DIELECTRIC WEB
Kenneth P. Thompson, Canton, N.C., assignor to Champion International Corporation, Stamford, Conn.
Filed Oct. 17, 1975, Ser. No. 623,468
Int. Cl.² H01T 19/04; B01K 1/00
U.S. Cl. 250—531 **3 Claims**



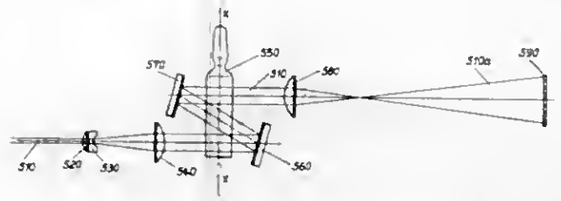
1. Apparatus for corona priming a dielectric web substrate for adhesion to plastic material comprising first and second rolls mounted for rotation on parallel axes, at least one of said rolls being mounted for biased movement towards the other roll, means for training said web between the nip of said first and second rolls for rolling engagement by both of said rolls, one of said rolls having as its entire web engaging surface the radially outer surface of a thin layer of dielectric material and means for effecting electrically conductive contact with substantially the entire radially inner surface of said dielectric layer, the other of said rolls having its entire web engaging surface formed of electrically conductive material, and means for supplying a corona producing voltage between said conductive material and said means for effecting conductive contact.

4,028,552
IMAGE COUNTER
Joseph A. Volk, Jr., Florissant, Mo., assignor to Beta Corporation, Bridgeton, Mo.
Division of Ser. No. 524,034, Nov. 15, 1974, abandoned. This application June 11, 1976, Ser. No. 695,168
Int. Cl.² G06K 7/10
U.S. Cl. 250—570 **18 Claims**



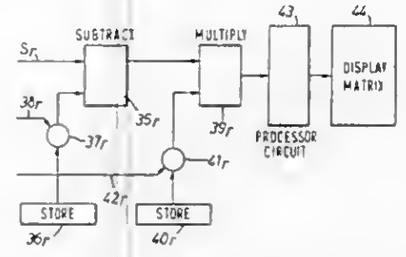
1. In an image counter having means for driving a film having image means thereon in a forward and reverse direction past a sensing means, said image means being defined from other areas of the film by the amount of light that passes therethrough, an automatic control system comprising at least two light sensing means located on one side of the film, one such light sensing means located at least in part ahead of the other relative to the direction of film travel, means for directing light toward the sensing means from the side of the film opposite the light sensing means such that the amount of light impinging on a sensing means varies as the various areas of the film pass between the light directing means and said light sensing means, whereby at least a portion of one of the light sensing means receives a change in the amount of light before any portion of the other light sensing means as each of the image means on the film moves past in either direction, an electrical circuit means, means associated with the electrical circuit means for generating a first electrical signal responsive to the change of light impinging on one of the sensing means, and for generating a second electrical signal in response to the change of light impinging on the other sensing means said first signal being out-of-time phase with said second signal in proportion to the distance the one sensing means is located ahead of the other relative to the direction of film travel, means responsive to a first signal relationship at one instant of time of the out-of-time phase signals for determining the direction of count corresponding to the direction of film travel, means responsive to a second signal relationship at another instant of time of the out-of-time phase signals for counting each image means as it moves past in the determined direction, and means responsive to said first and second electrical signals for stopping the film on a selected image.

4,028,553
APPARATUS FOR CONTROLLING PHARMACEUTICAL AMPOULES
Michel Farcinade, 19, rue des Delices, 1203 Geneva, Switzerland
Filed June 17, 1975, Ser. No. 587,759
Claims priority, application Switzerland, June 27, 1974, 8874/74; May 26, 1975, 6680/75
Int. Cl.¹ G01N 21/26
U.S. Cl. 250—576 **1 Claim**



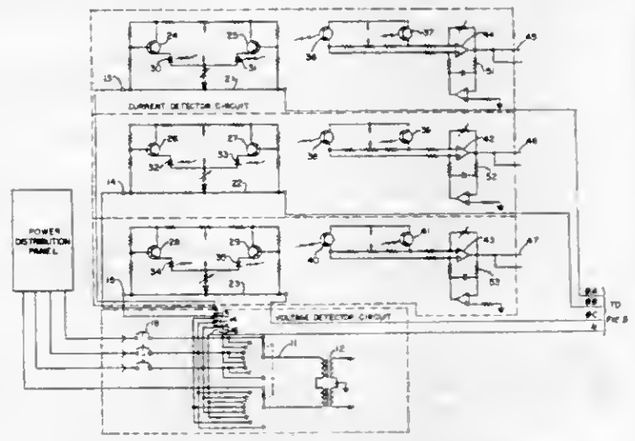
1. An apparatus for examining pharmaceutical ampoules containing an injectable liquid, comprising means for holding an ampoule vertically and for rotating the ampoule prior to an examination and holding it without rotation during the examination, a laser source, optical imaging means between said source and the ampoule to produce a laser beam in a vertical plane passing through the whole length of the ampoule, a multiplicity of photoelectric cells disposed to each receive at least a part of the beam having passed through the ampoule, and electrical means influenced by those cells having received light from the laser beam, for emitting a perceptible signal when the beam intercepts a solid particle in the liquid of an ampoule while the ampoule is at rest, said imaging means having a focal point and a numerical aperture enabling a focalization to produce an Airy spot for a conical beam of maximum length and minimum conicity, and said imaging means comprising a spherical beam-inlet lens and a cylindrical beam-outlet lens arranged to project a luminous bar in a focal axis at the center of an ampoule to be examined, the bar thickness being substantially that of the Airy spot at the focus of each spherical lens and at least one oblique mirror arranged in the path of the beam so that the beam passes through the ampoule at least two times each time at a different location.

4,028,554
RADIOLOGY
Godfrey Newbold Hounsfield, Newark, England, assignor to EMI Limited, Hayes, Middlesex, England
Filed June 5, 1975, Ser. No. 584,172
Claims priority, application United Kingdom, June 7, 1974, 25361/74
Int. Cl.² G01M 23/00
U.S. Cl. 250—445 T **10 Claims**



1. Radiological apparatus comprising source means for irradiating a body along a plurality of substantially co-planar paths, detector means for detecting the amount of radiation emergent from the body along each of said paths and for producing output signals indicative thereof, attenuator means, disposed between said source means and said detector means, constructed of regions of different thickness so as to substantially reduce variations in said output signals due to different lengths of said paths within said body, the material of said attenuator means being such as to alter, as a result of said different thickness, the spectrum of said radiation, and whercin means are provided for operating on said output signals to substantially reduce variations therein due to changes in the amount of radiation detected by said detector means attributable to said alteration in sprectrum.

4,028,555
POWER INTERRUPT TEST EQUIPMENT
Paul John O'Brien, Northfield, N.J., assignor to the United States of America as represented by the Secretary of the Department of Transportation, Washington, D.C.
Filed Nov. 17, 1975, Ser. No. 632,214
Int. Cl.² H01H 9/54
U.S. Cl. 361—76 **8 Claims**

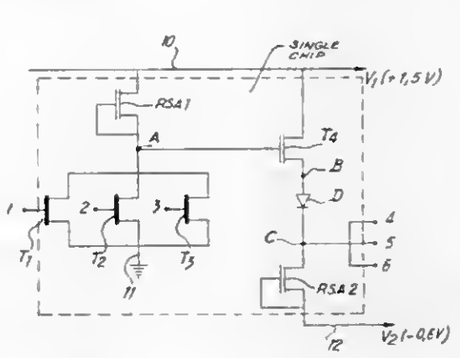


1. A method of determining power interrupted and restoration performance characteristics of electrical equipment comprising the steps of,

detecting the waveforms of the applied power, producing a control signal synchronous with selected phase angles of said waveforms,

and applying said signal to an electronic switch interconnecting said applied power to electrical equipment, whereby the power is interrupted at said selected phase angles.

4,028,556
HIGH-SPEED, LOW CONSUMPTION INTEGRATED LOGIC CIRCUIT
Gérard Cachier, and Jean Paul Puron, both of Paris, France, assignors to Thomson-CSF, Paris, France
Filed Mar. 12, 1975, Ser. No. 557,784
Claims priority, application France, Mar. 12, 1974, 74.08256
Int. Cl.² H03K 19/08, 19/34, 19/36
U.S. Cl. 307—205 **3 Claims**



1. An integrated logic circuit, comprising a plurality of semiconductor elements on a single chip,

a. said plurality of elements include a plurality of input field effect transistors with gates for separately receiving

"high" and "low" logic potential levels symmetrical with respect to the ground potential level, sources connected to the ground terminal, and drains in common connected through a first node and a first saturable load to a first supply source of a predetermined polarity;

b. wherein said input transistors have a first threshold voltage;

c. wherein said plurality of elements further include an output field effect transistor with its gate connected to said first node, its drain directly connected to said first supply source and its source connected to a second node through a diode, said second node being connected through a second saturable load to a second supply source whose polarity is opposite to the polarity of said first supply source;

d. wherein said output transistor has a second threshold voltage greater in absolute magnitude than said first threshold voltage;

e. wherein said second node constitutes the output terminal of the logic circuit on which are to be collected output potential levels respectively corresponding to said "high" and "low" logic potential levels received at the gate of any input field effect transistor;

f. wherein said first and second threshold voltages are arranged so that said output potential levels are the opposite of the algebraic values of said "high" and "low" logic potential levels and of the same absolute magnitude.

4,028,557

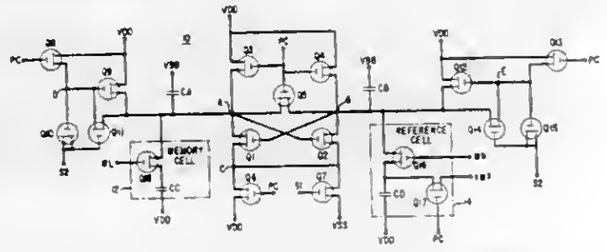
DYNAMIC SENSE-REFRESH DETECTOR AMPLIFIER

Dennis Robert Wilson, Allentown, Pa., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed May 21, 1976, Ser. No. 688,586

Int. Cl.² H03K *5/20, 3/286, 3/353;* **G11C** *7/06*

U.S. Cl. 307—362 **5 Claims**



1. A sense-refresh detector comprising:

first and second switching devices, each device having a control terminal and first and second output terminals;

first and second input/output terminals, the first output terminal of the first device and the control terminal of the second device being coupled to the first input/output terminal and the first output terminal of the second device and the control terminal of the first device being coupled to the second input/output terminal,

voltage equalization circuit means coupled to both input-/output terminals for periodically essentially equalizing the potentials of both input/output terminals;

first and second essentially identical load-refresh circuits, each load-refresh circuit comprising a capacitor circuit means having first and second terminals and third, fourth, and fifth switching devices each having a control terminal and first and second output terminals;

the control terminal of the third device of each load-refresh circuit being coupled to the first output terminal of the fourth device, the second output terminal of the fifth device, and the second terminal of the capacitor circuit means;

the second output terminals of the third and fourth devices being coupled together and being coupled to one input-/output terminal;

voltage setting circuit means being coupled to the second output terminals of the first and second devices for periodically setting the potential of said terminals to a preselected potential; and

conductive enabling circuit means being coupled to the second output terminals of the first and second switching devices for periodically facilitating conduction through the first and/or second switching device.

4,028,558

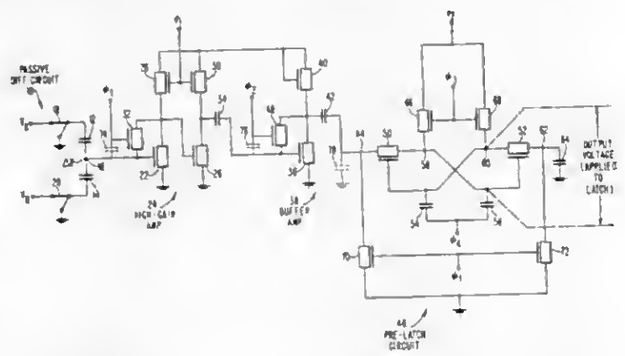
HIGH ACCURACY MOS COMPARATOR

Lawrence Griffith Heller, Brewster; Lewis Madison Terman, South Salem, and Yen Sung Yee, White Plains, all of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed June 21, 1976, Ser. No. 698,622

Int. Cl.² H03K *5/20, 3/353;* **H03F** *3/16;* **H04B** *15/00*

U.S. Cl. 307—355 **8 Claims**



1. A voltage comparator comprising

a differencing circuit for producing a difference signal indicating the polarity of the difference between two input signals,

an amplifier having an input node for receiving said difference signal and an output node for manifesting an amplified signal,

first switching means effective when placed in a first state to establish a biasing connection for setting said amplifier at a predetermined operating point which will be maintained after such connection is interrupted and effective when placed in a second state to interrupt such connection, leaving said amplifier biased at said operating point,

output circuitry for receiving signals manifested at the output node of said amplifier, said output circuitry including at least one stage which can be set to a first condition wherein it is incapable of responding to any signal manifested at said amplifier output node and settable thereafter to an alternative condition in which it is responsive to such a signal,

second switching means effective when placed in a first state to set said output stage in said first condition thereof and effective when placed in a second state to set said output stage in an alternative condition wherein it responds to the amplifier output signal,

and control means for causing said first switching means and said second switching means to operate in a timed relationship such that said second switching means is in its first state at the time when said fist switching means changes from its first state to its second state, whereby said output stage assumes its first condition during the time when a transient signal is being generated by interruption of the biasing connection in such amplifier and thereafter assumes an alternative condition responsive to the amplified difference signal at a time when said transient signal does not exist.

REGENERATIVE REPEATER CIRCUIT ARRANGEMENT FOR USE IN DIGITAL DATA TRANSMISSION SYSTEMS

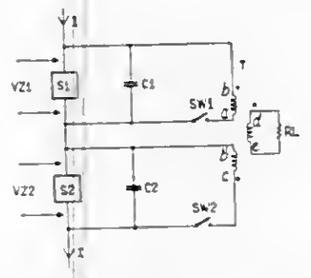
Douglas Stanley Larner, Maidenhead, England, assignor to Plessey Handel und Investments A.G., Switzerland

Filed Jan. 9, 1976, Ser. No. 647,733

Claims priority, application United Kingdom, Jan. 10, 1975, 1047/75

Int. Cl.² H03K *17/64*

U.S. Cl. 307—246 **3 Claims**



1. A transformer-coupled bi-polar pulse generating output stage for use in a digital data line transmission regenerative repeater generating half-width output pulses from a line-powered constant current power feed, said output stage comprising;

an output transformer having two primary windings and a secondary winding, the secondary winding connecting the output stage to the digital data line,

a pair of pulse generating switching device means for generating bi-polar pulses, each switching device means connected in series with a separate one of said primary windings,

a pair of reservoir capacitors, each reservoir capacitor connected in parallel with a separate primary winding and switching device means series circuit,

means for connecting each of said reservoir capacitors in series so that the reservoir capacitors are charged in series by the constant current power feed, and

means for stabilising a voltage drop across each primary winding and switching device means series circuit, comprising a pair of shunt stabiliser devices each connected in parallel with a separate reservoir capacitor.

4,028,560

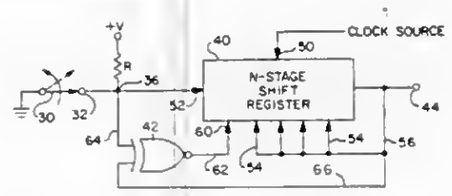
CONTACT BOUNCE TRANSIENT PULSE CIRCUIT ELIMINATOR

James R. Bainter, Scottsdale, Ariz., assignor to Motorola, Inc., Schaumburg, Ill.

Continuation of Ser. No. 439,503, Feb. 4, 1974, abandoned. This application Oct. 8, 1975, Ser. No. 620,676

Int. Cl.² H03K *17/56, 5/01*

U.S. Cl. 307—247 A **5 Claims**



1. A circuit for eliminating contact bounce comprising:

a. a single line for transmitting input signals, said input signals comprising a first level and a second level and transient pulses associated therewith, said first and second levels being mutually distinct;

b. logic and memory circuit means having an input terminal and an output terminal, said input terminal being connected to said single line for receiving said input signal at time tO;

c. said logic and memory means being selectively responsive to said input signal for eliminating said transient pulses associated with either said first and second level and for generating a desired output signal level at time, tl, at said output terminal after a predetermined time period, T, said output signal level being representative of said input signal received at tO, where $T = tl - tO$;

d. said logic and memory circuit means further comprising a logic means and a memory means;

e. means for connecting said output terminal to said logic means and to said memory means;

f. said logic means being responsive to compare said input signals and said output signal levels for selectively generating first and second control signals;

g. means for connecting said first and second control signals to said memory means;

h. said memory means being selectively responsive to said first control signal for generating and storing a representation of said input signal and transmitting said representation signal to said output terminal after said predetermined time period, T, for changing the output signal level;

i. said memory means being selectively responsive to said second control signal for maintaining said output terminal at its existing output signal level;

j. said memory means further comprising a shift register having N stages, a serial input terminal, N parallel input terminals, and a serial-parallel write mode select terminal, said serial-parallel write mode select terminal being connected to said logic means;

k. said serial-parallel write mode select terminal being responsive to said first control signal for storing and shifting said representation signal through said N stages in a serial mode for changing said output signal level; and

said serial-parallel write mode select terminal being responsive to said second control signal for writing the existing output signal level into said N stages for maintaining said output terminal at its existing output signal level.

4,028,561

FAST SWITCHING DARLINGTON CIRCUIT

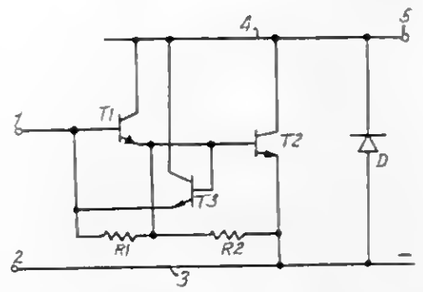
Christopher T. Black, Bedford, and Anthony Lear, Huntingdon, both of England, assignors to Texas Instruments Incorporated, Dallas, Tex.

Filed Mar. 23, 1976, Ser. No. 669,585

Claims priority, application United Kingdom, Mar. 25, 1975, 12373/75

Int. Cl.² H03K *17/00*

U.S. Cl. 307—300 **6 Claims**



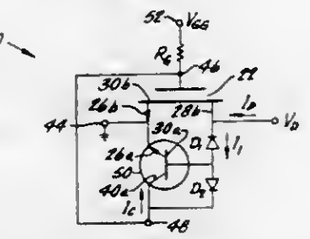
1. A fast switching darlington output circuit having a driver transistor and an output transistor in darlington connection; a first resistor connected between the base and emitter of the driver transistor; a second resistor connected from the emitter of the driver transistor to the emitter of the output transistor; and a speed-up transistor of very low gain having a collector commoned with the collectors of the driver and output transistors, a base connected to the emitter of the driver transistor and an emitter connected to the base of the driver transistor.

4,028,562

NEGATIVE IMPEDANCE TRANSISTOR DEVICE

Rainer Zuleeg, Huntington Beach, Calif., assignor to McDonnell Douglas Corporation, Long Beach, Calif.

Filed June 16, 1975, Ser. No. 587,093
Int. Cl.² H03K 17/60; H03B 17/00
U.S. Cl. 307—303 10 Claims



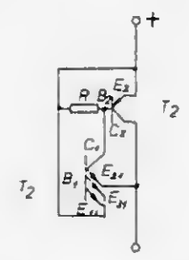
1. A transistor device providing high gain performance and exhibiting negative impedance characteristics, said transistor device comprising:
an enhancement mode insulated gate field effect transistor including a substrate region, a dielectric gate positioned over said substrate region, a source region, and a drain region which is spaced from said source region;
a bipolar transistor structurally integral with said field effect transistor and including a base, an emitter, and a collector;
a bulk region serving as said collector, said substrate region serving also as said base, and said source region serving also as said emitter;
a pn-junction located in proximity to said source and drain regions, said substrate region being separated by said pn-junction from said bulk region and left floating as said base of said bipolar transistor, and said substrate region common to said field effect and bipolar transistors causing interaction therebetween to provide said high gain performance and generate said negative impedance characteristics; and
a source and emitter contact to said source region, a drain contact to said drain region, and a collector contact to said bulk region, said collector contact being normally connected to said gate.

4,028,563

INTEGRATED ZENER DIODE

Ulrich Geisler, Gundelfingen-Wildtal, Germany, assignor to ITT Industries, Inc., New York, N.Y.

Filed June 25, 1976, Ser. No. 699,751
Claims priority, application Germany, July 23, 1975, 2532847
Int. Cl.² H03K 3/26; H01L 29/72, 27/02
U.S. Cl. 307—303 7 Claims



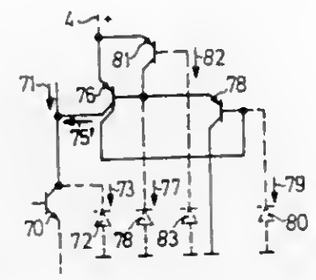
1. An integrated zener diode, comprising:
a first forward-biased load transistor having an emitter, base and collector;
a resistor; and
a second transistor having a collector, base and a plurality of emitters, the base of said first transistor coupled to the collector of said second transistor and, via said resistor, to the emitter of said first transistor and a first emitter of said plurality of emitters, the collector of said first transistor coupled to a second emitter of said plurality of emitters.

4,028,564

COMPENSATED MONOLITHIC INTEGRATED CURRENT SOURCE

Klaus Streit, Tubingen; Adolf Kugelmann, Leonberg, and Hartmut Seiler, Reutlingen, all of Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany

Division of Ser. No. 289,161, Sept. 14, 1972, abandoned. This application June 13, 1974, Ser. No. 478,974
Claims priority, application Germany, Sept. 22, 1971, 2147179
Int. Cl.² H01L 27/06
U.S. Cl. 307—310 3 Claims



1. Monolithic integrated current source comprising:
a source of power;
a first NPN transistor (70) on a substrate (13), the emitter of which is connected to the negative terminal (2) of said power source, said first NPN transistor (70) having a trough remainder current (73); and
a compensating circuit monolithically integrated on said substrate and connected to the collector of said first NPN transister (70) to compensate said trough remainder current (73) of said NPN transistor (70), said compensation circuit comprising:
a first lateral PNP transistor (76) having two collectors, the first collector of said first lateral PNP transistor (76) being connected to the collector of said first NPN transistor (70), and the emitter of said first lateral PNP transistor (76) being connected directly to the positive terminal (4) of said power source;
a second PNP transistor (78), the emitter of said second PNP transistor (78) being connected to the base of said first lateral PNP transistor (76), the base of said second PNP transistor (78) being connected to the second collector of said first PNP transistor (76), and the collector of the second PNP transistor (78) being connected to said substrate (13); and
a third PNP transistor (81), the base of which is left unconnected, the collector of said third transistor (81) being connected to the base of said first PNP transistor (76) and to the emitter of said second PNP transistor, and the emitter of said third transistor (81) being connected directly to the positive terminal (4) of said power source.

4,028,565

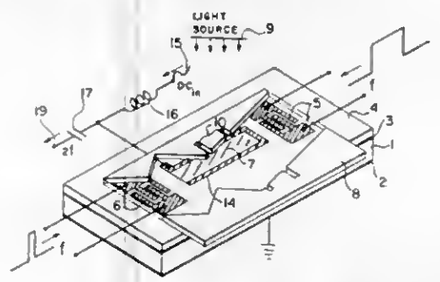
SEMICONDUCTOR VISIBLE IMAGE STORAGE DEVICE

Kenneth L. Davis, Fairfax, Va., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed June 27, 1975, Ser. No. 591,191
Int. Cl.² H01L 27/20, 31/00
U.S. Cl. 307—311 10 Claims

1. An optical storage system comprising:
a semiconductor substrate having first and second surfaces;

a metal film deposited over the first surface and coupled to ground;
an insulating layer deposited over the second surface;
a piezoelectric semiconductor layer deposited over the surface of the insulating layer having a resistivity enabling the storage of charge patterns;
a semitransparent electrode layer coupled to the surface of said piezoelectric semiconductor layer;



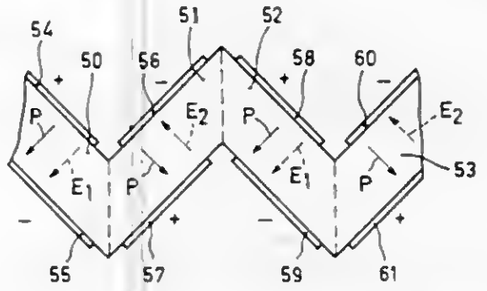
means for applying a bias voltage across said electrode and ground; and
means for projecting an optical image through said semitransparent electrode such that a charge pattern is injected and stored in said piezoelectric layer causing a corresponding accumulation or depletion of charge in said semiconductor substrate.

4,028,566

ELECTROACOUSTIC CONVERSION DEVICE HAVING A DIAPHRAGM COMPRISING AT LEAST ONE OF A PIEZOELECTRIC POLYMER MATERIAL

Nico Valentinus Franssen, Eindhoven, and Frans Josef Maria Frankort, Bocholtz, both of Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Feb. 23, 1976, Ser. No. 660,696
Claims priority, application Netherlands, Mar. 3, 1975, 7502453
Int. Cl.² H01L 41/04
U.S. Cl. 310—9.5 10 Claims



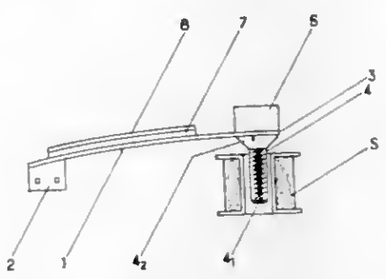
1. A device for converting an electric voltage into acoustic vibrations and vice versa comprising, a diaphragm including at least one layer of a piezo-electric polymer material which is polarized in a transverse direction and which at either side is provided with electrodes, the diaphragm being undulated in at least one orthogonal section, characterized in that each flank of the undulation is polarized in the same direction over its entire width, and in the operating condition the direction of the applied electric field is alternately parallel and anti-parallel relative to the polarizing directions in adjacent flanks.

4,028,567

ELECTROMAGNETIC VIBRATION-DETECTOR DEVICE, IN PARTICULAR FOR ANTI-THEFT PURPOSES

Jean Maillot, Paris, France, assignor to Paulette Guterman, Gif sur Yvette, France

Filed Apr. 9, 1976, Ser. No. 675,513
Claims priority, application France, Dec. 23, 1975, 75.39550
Int. Cl.² H02K 35/06
U.S. Cl. 310—25 8 Claims



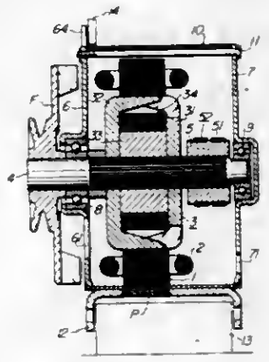
1. An electromagnetic vibration-detector device for anti-theft purposes, comprising a winding, a plunger core in the interior of the winding, a vibrating blade, means for fixing the core to the free end of the blade with the core extending into the winding and being free to vibrate with the blade, means for rigidly securing the other end of the vibrating blade relative to the winding, a thickness of cellular material, and means for securing the cellular material on at least one of the faces of the blade, said thickness of cellular material comprising on its free face a sheet of flexible material.

4,028,568

AC GENERATOR FOR VEHICLES

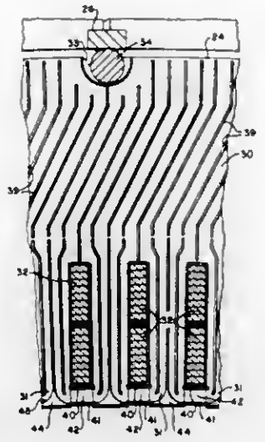
Hideo Tatsumi, Mito, and Yasushi Ohuchi, Katsuta, both of Japan, assignors to Hitachi, Ltd., Japan

Filed Oct. 29, 1975, Ser. No. 626,991
Claims priority, application Japan, Oct. 30, 1974, 49-124470
Int. Cl.² H02K 15/16
U.S. Cl. 310—42 3 Claims



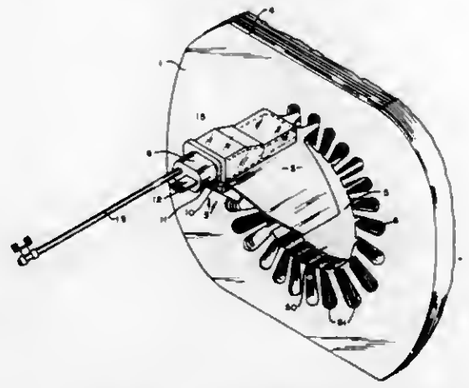
1. In an ac generator driven by the engine of a vehicle comprising a stator including a stator core, a stator winding wound around said stator core, and a stator frame surrounding said stator core, and a rotor including rotary magnetic poles and a field winding and rotatably supported within said stator frame, the improvement wherein said stator frame comprises
a pair of steel plate end covers and a steel plate cylindrical casing confined between said steel plate end covers, and further comprising
a U-shaped generator mounting seat affixed to said stator frame and wherein
said stator core, end covers, cylindrical casing and U-shaped seat are welded together as an integral unit.

4,028,569
VENTILATION SYSTEM FOR DYNAMOELECTRIC MACHINES
Raymond A. Towne, Penn Hills, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.
Filed June 16, 1975, Ser. No. 587,766
Int. Cl.² H02K *3/24*
U.S. Cl. 310—64 **7 Claims**



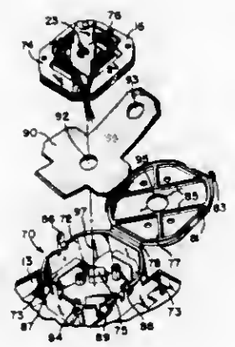
1. A dynamoelectric machine having a stator member and a rotor member separated by an air gap, said rotor member having salient poles and a ventilation system sealed off from the air gap, said stator member including a cylindrical stator core having a central bore with teeth extending longitudinally of said bore to form slots, a plurality of longitudinally spaced vent ducts extending radially through the core, stator windings disposed in said slots, means including two radially spaced members extending through each of the slots for defining longitudinal ducts extending through the slots adjacent the air gap and communicating with said radial vent ducts, means for sealing said longitudinal ducts and radial vent ducts from the air gap, and means for causing ventilating gaseous fluid to flow radially in said vent ducts and longitudinally in said longitudinal ducts from one vent duct to the next.

4,028,570
SELF LOCKING MOLDED THERMOSTAT STRAP
Vernon E. Kieffer, St. Louis, and Billy L. Damon, Manchester, both of Mo., assignors to Emerson Electric Co., St. Louis, Mo.
Filed June 18, 1975, Ser. No. 587,823
Int. Cl.² H02K *11/00*
U.S. Cl. 310—68 C **11 Claims**



1. A device for use in a motor having a stator assembly, said stator assembly including a core having a plurality of winding receiving slots formed in it, comprising:
a molded part having at least one side wall defining a receptacle well in the molded part, the molded part having a main body area, said receptacle well being located in said main body area;
means for releasably locking a protecting device in said receptacle well including at least one locking tab integrally formed along said main body area, said locking tab being mounted for movement between a first position for holding the protecting device in said receptacle well, and a second position for releasing the protecting device, said locking tab being biased toward said first position; and
means for positioning said molded part with respect to the slots of said stator assembly, said positioning means being inserted in the winding receiving slots of said stator assembly.

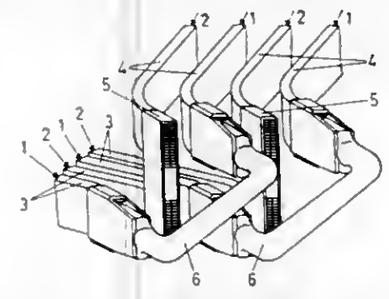
4,028,571
CONTROL MECHANISM FOR REMOTELY MOUNTED MOTOR
Paul A. Dicke, New Bremen, Ohio, assignor to Crown Controls Corporation, New Bremen, Ohio
Filed Feb. 25, 1976, Ser. No. 661,319
Int. Cl.² H02K *5/04*
U.S. Cl. 310—89 **9 Claims**



1. In a control mechanism for a remotely mounted motor comprising
a housing containing an indicator motor, an indicator dial rotatable by said motor, switch means, and a dial assembly for operating said switch means to control the direction of rotation of said motor,
the improvement characterized by
said housing including a base member and a cover,
a motor housing integrally molded within said base member and including
upwardly extending side wall means for orienting and holding said motor in place,
interior bosses for supporting the weight of said motor and to position said motor vertically,
a cover member for said motor housing including means therein defining an opening through which the shaft of said motor extends, and
means for securing said motor housing cover member against said side wall means to hold said motor within said housing.

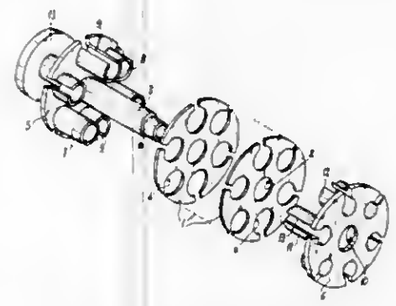
4,028,572
STATOR WINDING STRUCTURE FOR DYNAMO-ELECTRIC MACHINE
Kurt Baltisberger, Birr, Switzerland, assignor to BBC Brown Boveri & Company Limited, Baden, Switzerland
Filed May 7, 1975, Ser. No. 575,151
Claims priority, application Switzerland, May 20, 1974, 6855/74
Int. Cl.² H02K *3/04*
U.S. Cl. 310—201 **3 Claims**

1. A stator winding arrangement for a polyphase synchronous electrical machine of the pole-changeable type comprising first and second windings encased within each other and distributed in alternation in upper and lower layers in the stator slots, the respective pitches of said windings differing by an even number of slots, each said winding being composed of rigid conductor rods and including axially projecting ends to be interconnected, at least some of the ends of the rods of said first winding in a lower layer being connected to the ends of



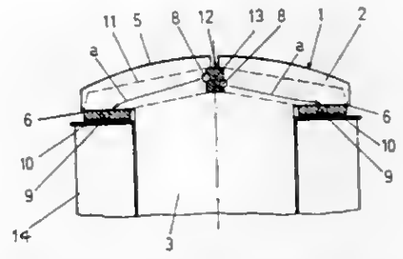
the rods of that winding in an upper layer by means of straight eye rods and at least some of the ends of the rods of said second winding in a lower layer being connected to the ends of the rods of that winding in an upper layer by means of oblique eye rods located axially outward from and which extend around said straight eye rods.

4,028,573
ROTOR FOR AN ELECTRICAL MACHINE
Andre Terrone, Romans, France, assignor to Societe Anonyme des Equipements S.E.I.M., Romans, France
Filed Apr. 26, 1976, Ser. No. 680,169
Claims priority, application France, Apr. 29, 1975, 75.14050
Int. Cl.² H02K *1/06*
U.S. Cl. 310—217 **10 Claims**



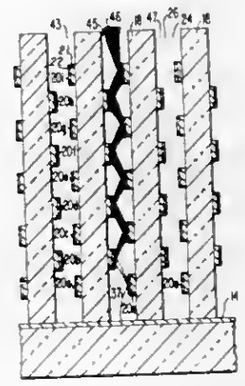
1. A rotor for an electrical machine comprising:
a shaft;
a first flange fixed to said shaft and formed with a plurality of angularly equispaced notches opening toward the periphery of said first flange;
a stack of ferromagnetic sheets on said shaft resting with one side against said first flange and having notches aligned with the notches of said first flange; and
a second flange elastically locked to said shaft and engaging the opposite side of said stack while being formed with a plurality of notches aligned with the notches of said stack, said flanges being formed on their faces turned toward said stack with axially extending alternately long and short hollow lugs received in the notches of said stack, the long hollow lugs of one of said flanges being aligned with the short hollow lugs of the other of said flanges.

4,028,574
SYNCHRONOUS MOTOR STRUCTURE INCORPORATING ROTOR HAVING SOLID POLES
Muzaffer Canay, Birr, Switzerland, assignor to BBC Brown Boveri & Company Limited, Baden, Switzerland
Filed Mar. 20, 1975, Ser. No. 560,529
Claims priority, application Switzerland, Apr. 1, 1974, 4497/74
Int. Cl.² H02K *1/24*
U.S. Cl. 310—269 **8 Claims**



1. A synchronous motor structure having a rotor component comprising a longitudinally extending central body portion, a plurality of solid poles extending outwardly from said body portion, each said pole including a shank terminating at its inner end in a claw connection by means of which said pole is secured to said central body portion and a pole shoe located at its outer end, conductor rods extending respectively in a longitudinal direction along opposite sides of said pole below said pole shoe from one end of the pole to the other and thence across opposite ends of the pole towards the center, said conductor rods together with the surface portion of said pole shoe forming single turn quadrature windings providing closed loop conductive paths confined to the pole for currents induced along the pole surface by the time-variable quadrature-field and which causes said currents to close around the quadrature-field, said quadrature windings also forming circuits parallel to the surfaces of said pole which thereby improves the asynchronous torque of the motor at low slip rates and reduces the oscillating torque.

4,028,575
ELECTRON MULTIPLIER IMAGE DISPLAY DEVICE
John A. van Raalte, Princeton, N.J., assignor to RCA Corporation, New York, N.Y.
Filed Nov. 28, 1975, Ser. No. 636,042
Int. Cl.² H01J *43/20, 43/10, 31/48*
U.S. Cl. 313—105 R **11 Claims**



1. An addressable video line generator for a flat image display device comprising:
a substrate;
a planar electron source on one surface of said substrate;
a plurality of substantialy parallel, planar, area electron multipliers on said one surface of said substrate in substantially orthogonal spaced relation to said planar elec-

tron source, each multiplier comprising a substantially linear output aperture and a plurality of dynode members between said electron source and said output aperture for multiplying and controlling the flow of a substantially linear electron beam therebetween, at least one of said dynode members being addressable; and

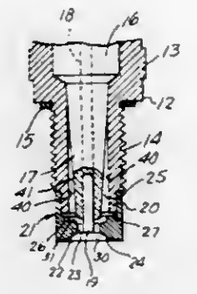
control means for applying an accelerating voltage or an inhibiting voltage to each addressable dynode member and accelerating voltages to the remaining dynode members in response to a control signal.

4,028,576

SONIC SPARK PLUG

David Wolsey, 3368 S. Ulster Court, Denver, Colo. 80231

Filed July 21, 1975, Ser. No. 597,753
Int. Cl.² H01T *13/20*
U.S. Cl. 313—143 **7 Claims**



1. A spark plug comprising a generally tubular conductive main body having a hollow conductive lower end portion exteriorly threaded to engage in an engine block, said hollow end portion having an inwardly projecting rib with a cylindrical inner surface, an insulator axially secured in said main body and having a lower end extending into said hollow end portion, an electrode axially secured in said insulator and having an exposed cylindrical rod-like portion positioned within the space defined by said cylindrical inner surface whereby a ring-like firing space is formed, said hollow end portion being provided with an acoustic cavity above said firing space, defining an acoustic system whose resonant frequency is proportional to the radial width of the ring-like firing space, inversely proportional to the height of the cylindrical inner surface and inversely proportional to the volume of the acoustic cavity, and the values thereof being selected to provide an acoustic resonant frequency of at least ten thousand Hertz, wherein said exposed rod-like portion extends for at least the full height of said cylindrical inner surface of said rib, and wherein said hollow end portion has an annular bottom mouth sloping downwardly and outwardly away from said firing space to define a front horn for said system.

4,028,577

ELECTRIC LAMP WITH INSULATING BASE

Paul E. Gates, Danvers; Stephen F. Kimball, Georgetown, and Stephen J. Leadvaro, Salem, all of Mass., assignors to GTE Sylvania Incorporated, Salem, Mass.

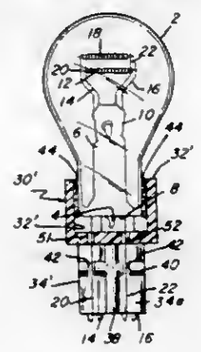
Continuation-in-part of Ser. No. 572,609, April 28, 1975, Pat. No. 3,979,627. This application June 23, 1976, Ser. No. 699,118
Int. Cl.² H01J *5/48, 5/50*
U.S. Cl. 313—318 **10 Claims**

1. An electric lamp comprising, in combination:

an hermetically sealed, light-transmitting envelope containing an energizable source of light and having a sealed portion at one end;

an insulting base member having a cylindrical cavity that is larger than the sealed end portion of said envelope, a wedge-lock portion depending from the bottom of said cavity, said wedge-lock portion having opposed substantially flat sides with locating means, including a transverse lock-in rib, formed on each of said opposed flat sides, and a plurality of channels passing through the bottom of said cylindrical cavity, said sealed end portion of the envelope being secured within said base cavity; and

a plurality of lead-in wires extending through the sealed end portion of said envelope and into the respective channels in the bottom of said cylindrical cavity, each of said lead-in wires having a terminal portion extending outwardly from the bottom of said cavity and proceeding



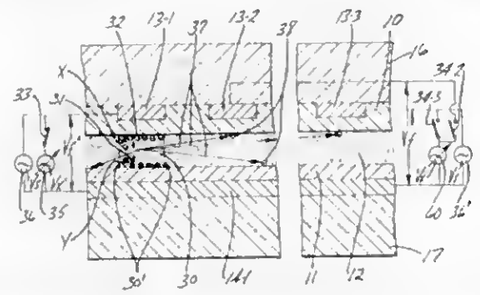
alongside said wedge-lock portion from the top to the bottom thereof, the terminal portion of at least a first one of said lead-in wires extending alongside and approximately parallel to one of said flat sides past the transverse lock-in rib thereon and engaging the bottom of said wedge-lock portion, and the terminal portion of at least a second one of said lead-in wires extending alongside and approximately parallel to the other of said flat sides past the transverse lock-in rib thereon and engaging the bottom of said wedge-lock portion.

4,028,578

GAS DISCHARGE DIELECTRIC CONTAINING A SOURCE OF BORON, GALLIUM, INDIUM, OR THALLIUM

Bernard W. Byrum, Jr.; Michael E. Feln, both of Toledo, and Roger E. Ernsthausen, Luckey, all of Ohio, assignors to Owens-Illinois, Inc., Toledo, Ohio

Filed Feb. 16, 1973, Ser. No. 333,091
Int. Cl.² H01J *61/35*
U.S. Cl. 313—221 **20 Claims**



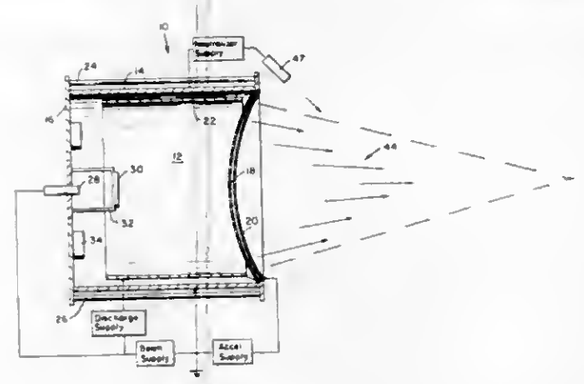
5. In a multiple gaseous discharge display/memory panel having an electrical memory and capable of producing a visual display, the panel being characterized by an ionizable gaseous medium in a gas chamber formed by a pair of opposed dielectric material charge storage members, each of which dielectric members is respectively backed by an array of electrodes, the electrodes behind the opposing dielectric member being oriented with respect to the electrodes behind the opposing dielectric member so as to define a plurality of discrete discharge units, the improvement wherein at least one dielectric member contains a layer of an oxide of gallium.

4,028,579

HIGH CURRENT DENSITY ION SOURCE

Harry J. King, Woodland Hills, Calif., assignor to Hughes Aircraft Company, Culver City, Calif.

Continuation of Ser. No. 516,718, Oct. 21, 1974, abandoned. This application June 29, 1976, Ser. No. 701,000
Int. Cl.² F03H *5/00;* **H05H** *5/02*
U.S. Cl. 313—361 **8 Claims**



7. An ion source comprising:

an electron bombardment discharge chamber for producing ions of a selected species, said chamber being defined at its outlet by a screen electrode having a plurality of openings therein;

an accelerator electrode positioned adjacent said screen electrode on the opposite side thereof from said discharge chamber, said accelerator electrode having openings therein, said accelerator electrode being connectable to a source of accelerating electric potential so that ions passing through openings in said screen electrode form individual ion beamlets which pass through corresponding openings in said accelerator electrode; and wherein the improvement comprises:

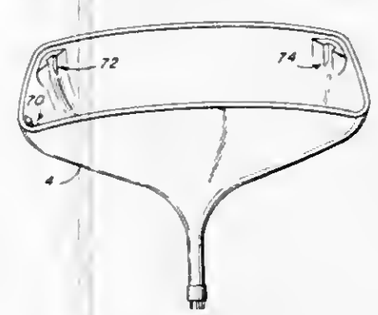
means for positioning said openings in said screen and accelerator electrodes with respect to each other so that said beamlets are each individually directed toward a downstream location to form a selected shaped beam cross section of smaller cross-sectional area at a location downstream from said accelerator electrode than the area at said accelerator electrode to produce a beam at the downstream location having higher current density than at said accelerator electrode.

4,028,580

SHADOW MASK MOUNT AND FUNNEL-FACEPLATE REFERENCING SYSTEM FOR COLOR CRT

Lawrence W. Dougherty, West Dundee, Ill., assignor to Zenith Radio Corporation, Glenview, Ill.

Filed Nov. 25, 1974, Ser. No. 527,001
Int. Cl.² H01J *29/07, 31/20*
U.S. Cl. 313—406 **3 Claims**



1. In a rectangular-type color cathode ray tube, the combination comprising:

an approximately rectangular, curved, flangeless faceplate having studs embedded in the four corners thereof and extending from a common concave inner surface of said faceplate, said studs each having a channel shape with a face section flanked by a pair of radially outwardly extending flanges, said studs each having a first end portion embedded in said faceplate and a second portion extending from the faceplate, said second portion having provision in said face section for coupling said stud to a shadow mask, said flanges of said stud constituting spaced faceplate reference surfaces;

a funnel having an approximately rectangular mouth sealed to said faceplate and provided in each of three corners of the mouth in registry with three of said studs, a pair of inside funnel reference surfaces, said pairs of funnel reference surfaces being oriented, located and spaced so as to respectively capture and make referencing engagement with said pairs of faceplate reference surfaces when the faceplate and funnel are mated, said faceplate and funnel reference surfaces uniquely determining the location of said faceplate relative to said funnel; and

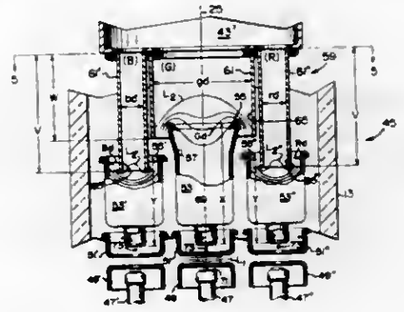
a shadow mask and mounting means on each corner of said mask for retentively engaging said provision on said studs such that said mask is supported adjacent said faceplate inner surface.

4,028,581

PLURAL BEAM ELECTRON GUN ASSEMBLY

Michael G. Stratton, Seneca Falls, N.Y., assignor to GTE Sylvania Incorporated, Stamford, Conn.

Filed June 24, 1976, Ser. No. 699,441
Int. Cl.² H01J *29/50, 29/51*
U.S. Cl. 313—414 **9 Claims**



1. A modified cathode ray tube three beam in-line bi-potential electron gun assembly having a longitudinal axis therethrough and including electron generating means formed to emit said respective beams of substantially differing current levels in a substantially common plane coextensive with said axis, said beams being directed from a center and two side-related guns to selectively impinge a spatially related patterned electron responsive screen, said electron gun assembly comprising in sequential order:

cathode means oriented in a common plane;

apertured control electrode means associated with said cathode means oriented in a common plane spatially related thereto;

apertured initial accelerator means positioned adjacent said control electrode means with the apertures thereof being in a common plane proximal to the apertures of said control electrode means;

focusing electrode means each having front and rear apertures with defined electrode lengths therebetween, said rear apertures being in common plane adjacent related apertures of said initial accelerator means, at least one of said focusing electrodes being an alpha member having a front aperture defined by a protruding tubular member having a diameter larger than that of the front apertures of the adjacently related beta focusing electrode members and having a definitive length greater than that of

said beta members to provide an increased object focal length for said alpha focusing electrode, said front alpha aperture being in a plane forward of the respective plane of said related front beta apertures; and

final accelerator means in the form of three in-line cylindrical electrode members each having front and rear apertures with definitive electrode lengths therebetween, said front apertures being in a common plane whereupon a cup-like terminal member is affixed, said cylindrical electrode members being substantially tube-like structures exhibiting at least differing delta and theta diameters and at least differing delta and theta definitive lengths thereby effecting the positioning of the respective rear delta and theta apertures in two parallel planes relative to the respective planes of the front apertures of said alpha and beta focusing electrodes, said delta accelerator member being the shortest in length and evidencing the largest apertural dimension such being larger than that of the related alpha protruding focusing electrode, the terminal portion of said alpha protruding focusing member being spatially and ingressively positioned slightly within the apertural opening of the larger delta accelerator member to provide a partial telescoping arrangement for effecting the forming and shielding of a large focusing lens substantially encompassed within said delta accelerator electrode thereby providing efficient focusing of the beam of highest current level, said side-positioned theta accelerator electrodes being longer cylindrical constructions evidencing rear apertured diameters smaller than said related front apertures of said related beta focusing electrodes wherein said respective theta accelerator members are ingressively oriented to provide a partial telescoping arrangement for effecting the forming and shielding of smaller focusing electrodes thereby providing focusing of the beams of lower current levels.

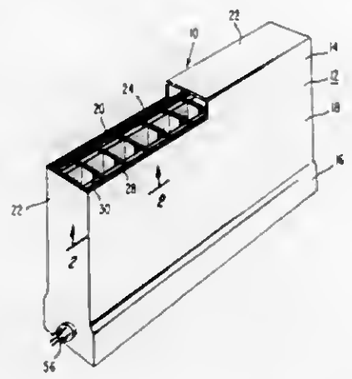
GUIDED BEAM FLAT DISPLAY DEVICE

Charles Hammond Anderson, Rocky Hill, and Stanley Bloom, Plainfield, both of N.J., assignors to RCA Corporation, New York, N.Y.

Filed Sept. 22, 1975, Ser. No. 615,353
Int. Cl.² H01J *29/72, 29/08, 31/00*
U.S. Cl. 313—422 **17 Claims**



1. An electron display device comprising

an evacuated envelope having a substantially flat front wall,

a phosphor screen along the inner surface of said front wall,

means in said device for generating a beam of electrons and directing said beam in a first path generally parallel to and across said phosphor screen,

means along said first beam path for selectively deflecting said beam out of said first path at selected points along said first path into a second path extending toward said phosphor screen so that the beam will impinge on said phosphor screen, and

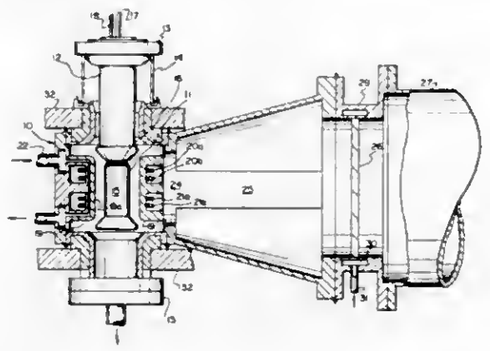
means along said second path for deflecting said beam in a plane transverse to said first path of the beam so that the beam will scan at least a portion of the phosphor screen.

4,028,583

HIGH POWER-DOUBLE STRAPPED VANE TYPE MAGNETRON

Clifford B. Bigham, Deep River, Canada, assignor to Atomic Energy of Canada Limited, Ottawa, Canada

Filed Mar. 10, 1976, Ser. No. 665,621
Claims priority, application Canada, Aug. 7, 1975, 233018
Int. Cl.² H01J *23/22*
U.S. Cl. 315—39.69 **2 Claims**



1. A high power double-strapped, vane-type magnetron comprising:

a. an evacuated housing,

b. an anode structure mounted in the housing and formed of an even number of vanes defining resonant cavities therebetween and at least one pair of circumferential straps passing through openings in the vanes with the straps connected in interleaved relation to alternate vanes, said vanes having cooling channels therein directly behind the anode surface to be bombarded by electrons,

c. a cathode structure mountèd centrally of said anode, said cathode structure comprising a secondary emission cathode surface and a separate starting filament mounted thereon,

d. a coupling slot connecting one of said resonant cavities via a ridged waveguide transition and a window to an output waveguide, and

e. means for applying an axial magnetic field in the region between the anode and cathode.

4,028,584

DRIVING CIRCUIT FOR SELECTING CONTROL CELLS OF A GAS DISCHARGE PANEL BY TRANSISTORS THROUGH DIODES

Masamichi Shutoh, Tokyo, Japan, assignor to Nippon Electric Company, Ltd., Tokyo, Japan

Filed Sept. 17, 1975, Ser. No. 614,188
Claims priority, application Japan, Oct. 18, 1974, 49-120508
Int. Cl.² H05B *41/14;* **H01J** *65/00*
U.S. Cl. 315—169 TV **7 Claims**

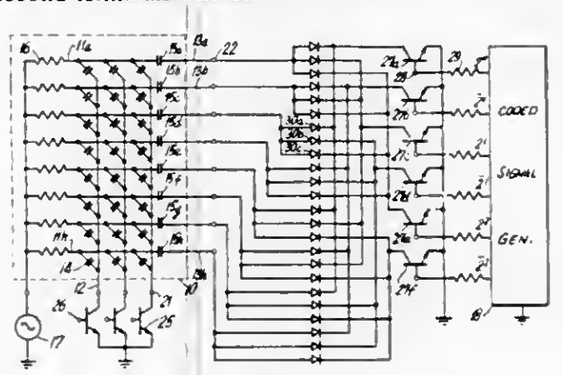
1. A driving circuit for a gas discharge panel comprising a set of first electrodes, a set of second electrodes opposite to the first electrodes, third electrodes opposite and in one-to-one correspondence to the first electrodes, display cells between each of the second electrodes and at least one of the first electrodes, and control cells between the first electrodes and the corresponding third electrodes, said second and third electrodes disposed facing the same surface of said first electrodes, said circuit comprising;

a plurality of first terminals connected to the second electrodes,

a plurality of second terminals connected to the third electrodes,

a group of first switching elements connected to said first terminals,

a plurality of directional circuit elements connected to said second terminals, said directional circuit elements being greater in number than said second terminals, and a plurality of second switching elements connected to said directional circuit elements, the number of said second switching elements being smaller than the number of said second terminals wherein:



a predetermined number of said directional circuit elements are connected to each of said second terminals, and

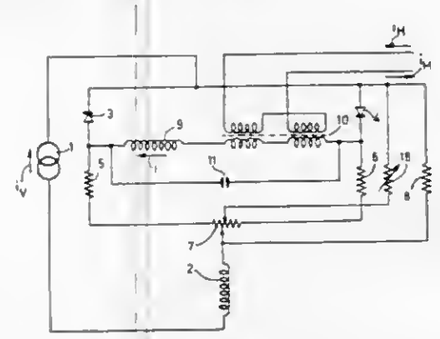
said second switching elements are divided into said predetermined number of subgroups, the directional circuit elements connected to each of said second terminals being connected to one of said second switching elements of the respective subgroups thereof.

4,028,585

CIRCUIT FOR GENERATING A CORRECTION CURRENT FOR CORRECTING FOR DEFLECTION ERRORS ON THE DISPLAY SCREEN OF A COLOR TELEVISION DISPLAY TUBE

Adrianus Hubertus Kantelberg, and Leonardus Albertus Antonius Valkestijn, both of Eindhoven, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Mar. 11, 1976, Ser. No. 665,954
Claims priority, application Netherlands, Mar. 27, 1975, 7503666
Int. Cl.² H01J *29/56*
U.S. Cl. 315—371 **9 Claims**



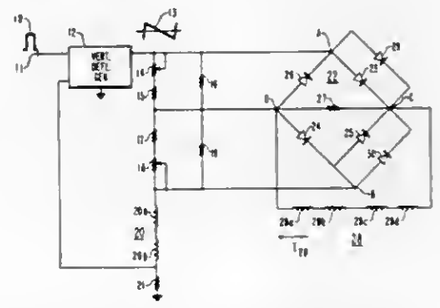
1. A circuit for use with vertical deflection coil having a core and an auxiliary winding means disposed on said core for generating a magnetic quadripolar field substantially in the deflection plane, said circuit comprising an output amplifier means for supplying a deflection current of field frequency to said deflection coil for deflecting in the vertical direction at least one electron beam generated in a display tube, and means for correcting deflection errors of said beam without affecting said field frequency deflection current comprising the circuit being adapted to be coupled in series with the deflection coil and including a bridge circuit comprising diodes and resistors, a resistor coupled in a diagonal branch of the bridge circuit, the auxiliary winding being adapted to be coupled in the other diagonal branch.

4,028,586

PARABOLIC CURRENT GENERATOR

Lewis Irwin Mengle, Lancaster, Pa., assignor to RCA Corporation, New York, N.Y.

Filed Feb. 2, 1976, Ser. No. 654,719
Int. Cl.² H01J *29/70, 29/76*
U.S. Cl. 315—368 **4 Claims**



1. An improved parabolic current generator for providing a convergence correction current in a deflection system utilized in a display system, comprising:

a deflection generator coupled to a deflection winding for providing an alternating current sawtooth scanning waveform therein;

said parabolic current generator including a bridge circuit having its input terminals coupled in series with said deflection winding and its output terminals coupled to a convergence correction winding for providing said parabolic correction current therethrough;

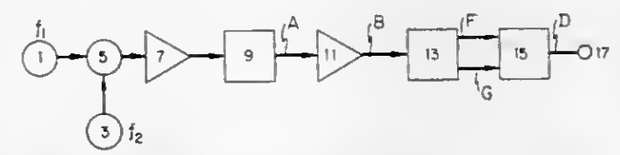
said generator further including first and second impedance networks coupled in series with each other and the two of them coupled in parallel with said input terminals of said bridge, said networks each including a first fixed resistance coupled in parallel with a series coupled potentiometer and a second resistance, the junction of said networks being coupled to one of said output terminals of said bridge for allowing separate adjustment of said correction current during each polarity of said alternating current scanning waveforms and for limiting the amount of correction current flowing through said potentiometer.

4,028,587

MARKER CIRCUIT

Gary Wayne Holmlund, Santa Rosa, Calif., and Toshio Ichino, Hino, Japan, assignors to Hewlett-Packard Company, Palo Alto, Calif.

Filed Apr. 14, 1975, Ser. No. 567,466
Claims priority, application Japan, Sept. 6, 1974, 49-102570
Int. Cl.² G01R *13/30*
U.S. Cl. 315—377 **6 Claims**



1. A circuit for generating a marker signal comprising:

a first input circuit for receiving a first signal;

a second input circuit for receiving a second signal;

mixing means connected to the first and second input circuit for producing a beat signal having a frequency equal to the difference between the frequencies of the first and second signals;

frequency detecting means connected to the mixing means for detecting when the frequency of the beat signal is below a predetermined threshold frequency and for producing output signals indicating whether the beat signal frequency is above or below the predetermined threshold frequency, the frequency detecting means comprising a pulse generator connected to the mixing means for producing a pulse having a duration equal to one half the period of the threshold frequency, and comparator means connected to the mixing means and the pulse generator for comparing the period of the beat signal with the duration of the pulse and for producing a first output signal when the period of the beat signal is less than twice the duration of the pulse and a second output signal when the period of the beat signal is more than twice the duration of the pulse; and

output means connected to the frequency detecting means for producing an output marker signal in response to receipt of the first output signal but not in response to receipt of the second output signal.

4,028,588

ARRANGEMENT FOR VARYING THE EXCITATION OF A DEFLECTION CIRCUIT IN RESPONSE TO LOAD CHANGES AND THE LIKE

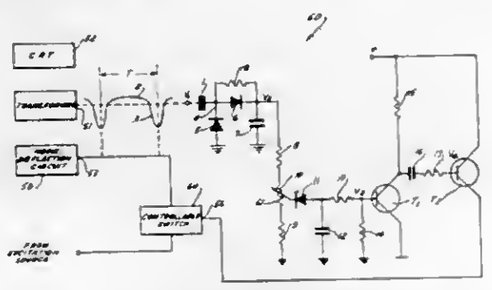
Heinz Kraus, Burggrub, Germany, assignor to Loewe-Opta GmbH., Kronach, Germany

Filed Dec. 17, 1975, Ser. No. 641,644

Claims priority, application Germany, Dec. 19, 1974, 2460014

Int. Cl.² H01J *29/70, 29/76*

U.S. Cl. 315—387 **5 Claims**



1. In an apparatus for varying the excitation of a sweep deflection circuit, the deflection circuit including a transformer exhibiting a repetitive voltage occurring at a first rate and having a first forward sweep portion and a second flyback portion, the apparatus including a thyratron-like switching element associated with the deflection circuit and responsive to a variable-phase trigger control pulse applied to a control electrode of such switching element for varying the excitation of the deflection circuit in proportion to changes in the phase of the control pulse, an improved arrangement for varying the triggering instant of the switching element which comprises, in combination, means coupled to the transformer and responsive to the first voltage portion for generating, at the first rate, a saw-tooth voltage having a constant difference between its maximum and minimum voltage values and further having an effective variable DC component instantaneously proportional to the amplitude of the then-occurring first voltage portion, means coupled to the sawtooth voltage generating means for generating a constant-amplitude control pulse at the instant when the sawtooth voltage exceeds a predetermined amplitude, and means for applying the control pulse to the control electrode of the switching element.

4,028,589

CIRCUIT ARRANGEMENT IN A TELEVISION RECEIVER, PROVIDED WITH A LINE DEFLECTION CIRCUIT AND A SWITCHED SUPPLY VOLTAGE CIRCUIT

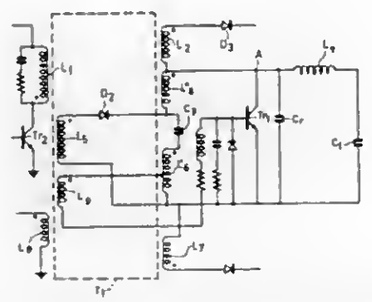
Oswald Johannes Verbeij, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Jan. 21, 1976, Ser. No. 651,197

Claims priority, application Netherlands, Feb. 5, 1975, 7501339

Int. Cl.² H01J *29/70, 29/76*

U.S. Cl. 315—408 **3 Claims**



1. A circuit arrangement for use with a television line deflection coil, said circuit arrangement comprising a first switch controllable at the line frequency and a first winding, coupled to said first switch, a supply voltage circuit means also switched at the line frequency for controlling said first switch comprising a second switch controllable at the line frequency and a second winding coupled to said second switch, a first current loop comprising the first winding, a third winding coupled to the second winding, a diode conducting during the cut-off time of the second switch and a capacitor, and a second current loop which comprises a fourth winding coupled to the first winding and a fifth winding coupled to the third winding.

4,028,590

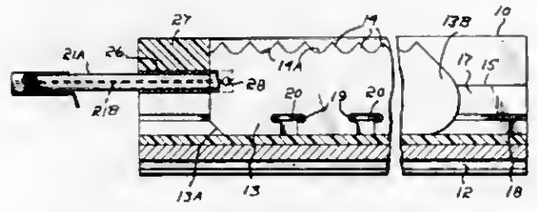
ANTI-STATIC BAR

Peter Bishop, Portland, Maine, assignor to United Industrial Syndicate, Inc., Portland, Maine

Filed Dec. 15, 1975, Ser. No. 640,578

Int. Cl.² H05F *3/04*

U.S. Cl. 361—220 **12 Claims**



1. An anti-static bar including a supporting member having a lengthwise channel, a conductor in the form of a thin metal strip having a serrated edge, insulating means within said channel and secured to said member, means connecting said serrated conductor in said insulating means with said conductor extending lengthwise of said channel parallel to but between the side walls of the member with its serrated edge protruding from said insulating means and exposed adjacent the edges of said walls to provide a series of discharge points, and a cable attached to said member with its conductor connected to the serrated conductor.

4,028,591

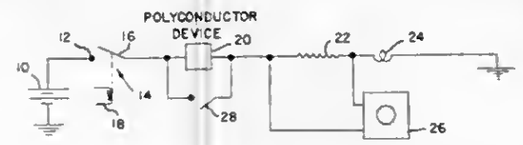
RELAY CONTACT PROTECTOR

David Kahn, Harrisburg, and Howard Richard Peiffer, New Cumberland, both of Pa., assignors to AMP Incorporated, Harrisburg, Pa.

Continuation-in-part of Ser. No. 399,643, Sept. 21, 1973, abandoned, which is a continuation-in-part of Ser. No. 351,716, April 16, 1973, abandoned. This application Oct. 22, 1975, Ser. No. 624,810

Int. Cl.² H02H *3/00*

U.S. Cl. 361—11 **21 Claims**



1. In an electrical circuit having at least two contacts that are systematically mated and unmated, a device to prevent breakdown of said contacts due to current surges causing arcing across said contacts, said device comprising:

a polyconductive member formed of material having a negative temperature-resistance characteristic such that its resistance at temperatures below a predetermined critical temperature is at least several orders of magnitude larger than its resistance at temperatures above the critical temperature; and

means connecting said polyconductor member in series with said contacts,

whereby electrical current passing through the polyconductive material initially encounters a high resistance until sufficient current passes to raise the temperature of the polyconductive material by Joule effect heating to above the critical temperature after a predetermined time period sufficient to allow said contacts to stop bouncing and achieve a stable mated state after which full current is allowed to pass maintaining said polyconductor heated above the critical temperature.

4,028,592

MEANS FOR INCREASING THE STABILITY IN HIGH-VOLTAGE POWER SUPPLY NETWORKS

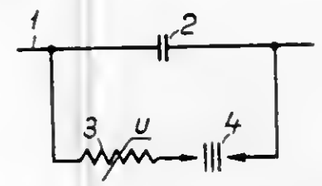
Nils Fahlen, Vasteras, and Asie Schei, Ludvika, both of Sweden, assignors to ASEA Aktiebolag, Vasteras, Swedeo

Continuation of Ser. No. 148,110, Nov. 21, 1973, abandoned. This application Dec. 24, 1974, Ser. No. 536,227

Claims priority, application Sweden, Dec. 22, 1972, 16863/72

Int. Cl.² H02H *7/16*

U.S. Cl. 361—16 **4 Claims**



1. Series capacitor bank for achieving an uninterrupted stabilization of the condition of operation in high-voltage electric power supply networks with a capacitor, and a back-up safety circuit connected in parallel with the capacitor, said safety circuit including means responsive to disturbances of a magnitude which causes overvoltages which may damage the capacitor to short-circuit the capacitor, comprising a first current path in parallel with the capacitor and said safety circuit, said first current path including a spark gap in series with a voltage-dependent resistor for controlling the current through the current path in dependence on the voltage across the capacitor, said resistor means having a very high resistance as long as the voltage across the capacitor is below a predetermined value which is dependent on the electric properties of the capacitor, said value being higher than the operating voltage of the capacitor but lower than the voltage at which said safety circuit becomes effective and short-circuits the capacitor, the resistance of the resistor means decreasing for voltages exceeding said predetermined value, whereby said capacitor is not short-circuited by said safety circuit with voltages between said operating voltage and said predetermined voltage.

4,028,593

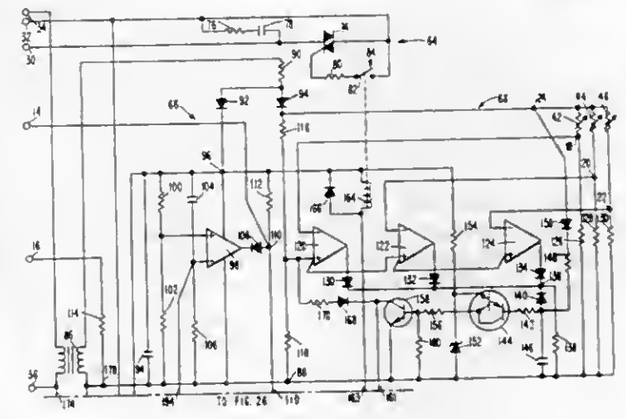
MOTOR CONTROL CIRCUIT

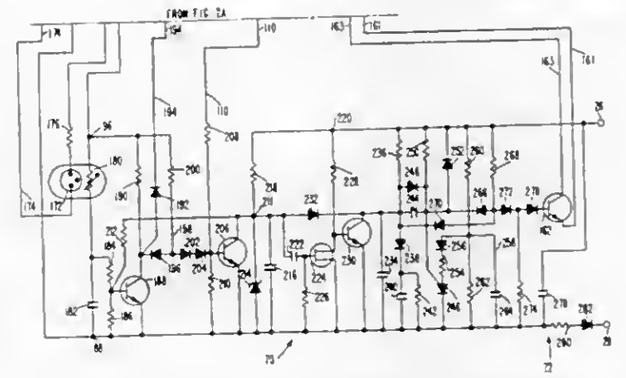
Dennis E. Newell, El Segundo, Calif., assignor to Robertshaw Controls Company, Richmond, Va.

Filed Jan. 15, 1976, Ser. No. 649,291

Int. Cl.² H02H *7/08*

U.S. Cl. 361—27 **21 Claims**





1. In a control circuit for controlling a motor usable in a refrigeration system, the combination comprising

relay means to selectively energize the motor,

first and second transistors both connected to the relay means so that each can inhibit its operation,

a temperature responsive circuit responsive to the temperature inside the motor to cause the first transistor to inhibit operation of the relay means in the event of a high temperature condition,

a delay after break timer to cause the second transistor to inhibit relay means operation for a predetermined period after any shut down of the motor,

a refrigerant pressure responsive circuit to trigger the delay after break timer if the refrigerant pressure is insufficient, and

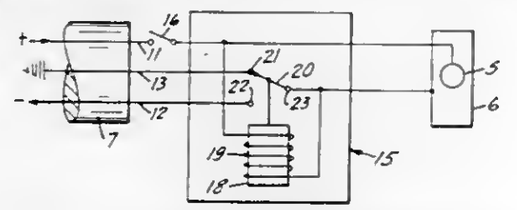
a lock-out circuit responsive to actuation of the temperature responsive circuit or the refrigerant pressure responsive circuit to cause the second transistor to inhibit relay means operation following a fault condition.

4,028,594

SAFETY CIRCUIT FOR ELECTRICAL EQUIPMENT

George W. Schossow, 2316 Lilac Lane, White Bear Lake, Minn. 55110

Filed Nov. 7, 1975, Ser. No. 629,793
Int. Cl.² H02H 3/14
U.S. Cl. 307—326 11 Claims



1. A safety circuit for use with appliances having a load and a three wire cord having a plug, a B+ line, a neutral line, and a ground line, said circuit comprising

manually operated switch means in series with said B+ line for closing a circuit upon operation of said switch means, and

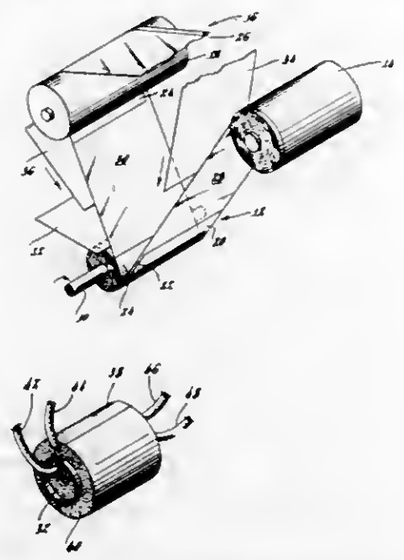
switching means in series with said manually operated switch means and connected to said neutral line and a said ground line to be responsive to the presence of current between said B+ line and ground when said manually operated switch means is operated, said switching means including conducting means which are triggered upon said presence of current for closing a circuit between said B+ line and said neutral line to a load, for placing said switching means in parallel with said load to latch in said switching means and maintain the circuit to said load closed, and for simultaneously opening the ground line to said switching means.

4,028,595

MULTI-VOLTAGE CAPACITOR SECTION

Robert M. Stockman, Brookfield Center, Conn., assignor to American Radionic Co., Inc., Danbury, Conn.

Filed Dec. 2, 1975, Ser. No. 637,091
The portion of the term of this patent subsequent to Nov. 18, 1992, has been disclaimed.
Int. Cl.² H01G 4/38
U.S. Cl. 361—328 6 Claims



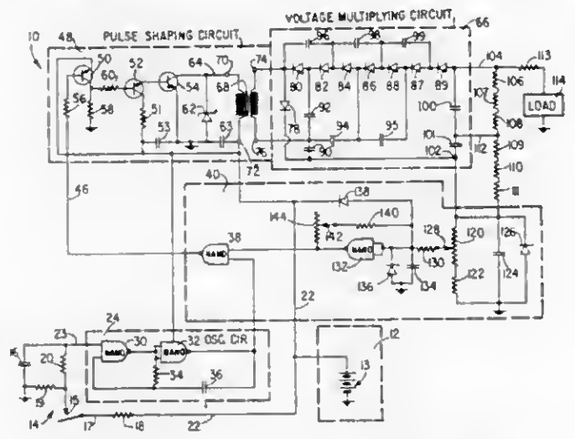
1. A capacitor section comprising: first and second dielectric strips wound together in cylindrical form; first and second conductive plates separated by said first and second dielectric strips, at least one of said plates being interrupted across its length to thereby form at least two electrical capacitors; a non-conductive sheet inserted between said strips and extending outwardly from a first end of said section adjacent said interrupted length to form a circular barrier separating the interrupted portions of said one plate; and supplemental third and fourth dielectric strips adjacent said first and second dielectric strips in one of said capacitors whereby said two capacitors have different voltage ratings.

4,028,596

CORONA POWER SUPPLY CIRCUIT

Harold J. Weber, Sherborn, Mass., assignor to Coulter Information Systems, Inc., Bedford, Mass.

Continuation-in-part of Ser. No. 532,713, Dec. 12, 1974, abandoned, which is a continuation-in-part of Ser. No. 378,136, July 11, 1973, abandoned. This application Oct. 20, 1975, Ser. No. 623,903
The portion of the term of this patent subsequent to Oct. 12, 1993, has been disclaimed.
Int. Cl.² G03G 15/00
U.S. Cl. 361—235 25 Claims



1. A portable power supply for producing a high corona output when coupled to a D.C. power source including in combination:

oscillator means operative to develop first oscillations;

control means coupled to said oscillator means and operative to develop second oscillations in response to said first oscillations and a corona signal indicating a corona output below a predetermined level;

pulse-shaper means coupled to said control means and operative to develop a first voltage pulse having one polarity in response to a first half of each cycle of said second oscillations and to develop a second voltage pulse having the opposite polarity in response to the second half of each cycle of said second oscillations, said pulse-shaper means being operative to draw substantially all operating current during said first half of each cycle of said second oscillations and substantially no operating current during the second half of each cycle of said second oscillations;

multiplier means coupled to said pulse-shaper means and operative only in response to said first and second voltage pulses coupled thereto to develop said corona output;

means for coupling said corona signal from said multiplier means to said control means.

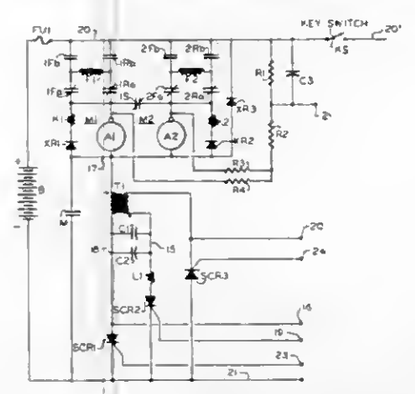
4,028,597

MOTOR CONTROL SYSTEMS

Michael J. Delaney, Greene, and Hiram G. Gilbert, Binghamton, both of N.Y., assignors to The Raymond Corporation, Greene, N.Y.

Filed July 12, 1974, Ser. No. 487,890
Int. Cl.² H02P 3/00
U.S. Cl. 318—87 30 Claims

1. A battery-powered vehicle comprising a base mounted on a pair of non-steerable drive wheels and having a steering wheel; first and second series-field direct-current motors connected to drive respective ones of said drive wheels at mutually relative speeds dictated by the positioning of said steering wheel; first directional contactor means for connecting power from a first circuit terminal through the field of said first motor to a first terminal of the armature of said first motor, second directional contactor means for connecting said first circuit terminal through the field of said second motor to a first terminal of the armature of said second motor; thyristor means and a battery connected in series between a second terminal of each of said armatures and said first circuit terminal; pulse generator means for applying pulses to said thyristor means to turn said thyristor means on and off; timing circuit means for controlling said pulse generator means to vary the conduction duty cycle of said thyristor means; means for sensing whether said motors are being accelerated or plugged; a normally-closed contactor connected between said first terminals of said armatures; and means responsive to adjustment of an operator control and responsive to said sensing means for energizing said normally-closed contactor to open its contacts while said motors are being accelerated and for de-energizing said normally-closed contactor while either one or both of said motors are being plugged.

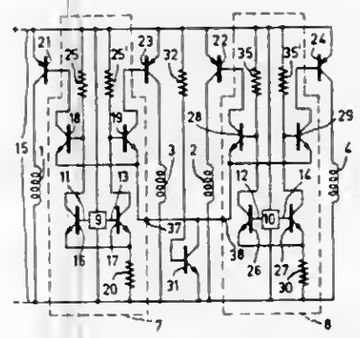


4,028,598

DIRECT-CURRENT MOTOR COMPRISING AN ELECTRONIC COMMUTATOR

Hendrik Jan Bergmans, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Continuation of Ser. No. 872,158, Oct. 29, 1969, abandoned. This application Jan. 7, 1974, Ser. No. 431,017
Claims priority, application Netherlands, Nov. 1, 1968, 6815585
Int. Cl.² H02K 29/02
U.S. Cl. 318—138 3 Claims



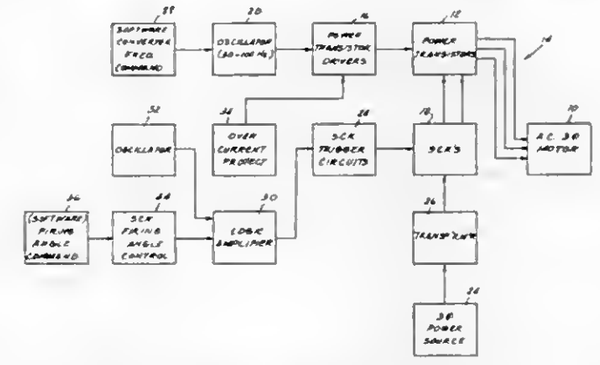
1. A direct-current motor comprising a source of direct voltage, a permanent magnetic rotor, at least two stator windings, an electronic switching device haivng the same number of Hall elements energized by said direct voltage and exposed to the rotor field, at least two control transistors, means connecting the output terminals of said Hall elements individually to the base electrodes of the control transistors, means comprising a plurality of amplifying transistors for individually coupling the control transistors to corresponding stator windings so that the current through the various stator windings is controlled as a function of the position of the rotor, characterized in that the amplifying transistors form at least one group of at least two transistors, a source of substantially constant current comprising a transistor of the same conductivity type as the transistors of the associated group of amplifying transistors, means for energizing the emitter electrodes of the amplifying transistors in common from said source of substantially constant current including, means connecting the collector of said transistor to the emitters of the transistors of said group, and means connecting its emitter to one terminal of a source of forward direct voltage and its base electrode to the other terminal of said source through a resistor, whereby in any position of the rotor only one transistor of each group can be fully conducting and each winding can be fully energized over an angle of at the most 120° relative to a bipolar rotor in a given direction.

4,028,599

METHOD OF CONTROLLING AN A.C. MOTOR

Frank Zankl, Milwaukee; Edward E. Kirkham, Brookfield; Richard E. Stobbe, Greenfield, all of Wis., and John J. Schachte, West Hartford, Conn., assignors to Kearney & Trecker Corporation, West Allis, Wis.

Continuation of Ser. No. 285,813, Sept. 1, 1972, Pat. No. 3,878,445. This application Feb. 19, 1975, Ser. No. 551,145
Int. Cl.² H02P 7/00; G06B 11/14
U.S. Cl. 318—227 2 Claims



1. A method of controlling the application of power to an a.c. motor in a servo system, said motor having a plurality of stator field windings, comprising the step of electronically calculating, from a first parameter representative of motor speed and a second parameter representative of the programmed position of said motor, a quantity for the torque required of said motor and the required position of the stator field of said motor during a succeeding period to perform in accordance with said second parameter, for each calculation of said torque quantity, producing a signal at a time representative of said torque quality, using said signal to actuate at controlled rectifier to produce, from an a.c. voltage, a d.c. voltage having an amplitude representative of said torque quantity, and producing, for each calculation of said stator field position quantity, a signal for controlling application of a source of electrical power to the stator field windings of said motor to cause said stator field to assume a position adjacent to the position represented by said stator field position quantity.

4,028,600

METHOD AND APPARATUS FOR SLOW SPEED OPERATION OF AN INVERTER CONTROLLED ROTATING FIELD MACHINE

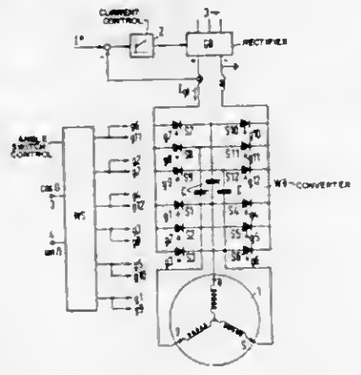
Felix Blaschke, Erlangen, and Herwig Klautschek, Furth, both of Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany

Continuation-in-part of Ser. No. 381,541, Aug. 23, 1973, abandoned. This application May 15, 1975, Ser. No. 577,918

Claims priority, application Germany, Apr. 3, 1975, 2514557

Int. Cl.² H02K *17/02*; **H02P** *8/00*

U.S. Cl. 318—227 **16 Claims**



1. A method for controlling the impressed position of the stator current vector in a convertor driven rotating field machine, which can be energized only to provide a predefined pluraltiy of discrete vector positions, such as to avoid uneven running at low rotation speeds comprising:

a. defining a desired impressed position of the stator current vector; and

b. alternately energizing the two discrete vector positions on each side of said desired position for relative time periods which will result in an average vector position corresponding to said desired position.

4,028,601

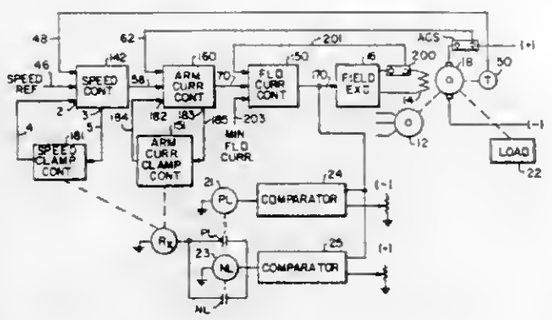
MULTI-LOOP DIRECT CURRENT MOTOR REGULATING SYSTEM PROTECTED AGAINST WINDUP BY A CLAMP CIRCUIT

Robert S. Peterson, Williamsville, N.Y., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed May 23, 1975, Ser. No. 580,381

Int. Cl.² H02P *7/30*

U.S. Cl. 318—271 **6 Claims**



1. In a motor control system having at least an inner and an outside control loop, wherein said inner loop includes limiter means for holding the output control signal of said control system for said motor within a predetermined control level, the combination of:

means responsive to limiting operation of said limiter means and operative with said outside loop for establishing an overriding error signal in relation to a control level existing in said outside loop upon initiation of said limiting operation; with said outside control loop including an input control signal representing a system variable and an integrator responsive to said input control signal for establishing a continuous integrated voltage characteristic of said control level for said system variable;

with said overriding error signal establishing means including means normally responsive to said integrated voltage for storage thereof as a stored voltage; said storage means becoming non-responsive to said integrated voltage when said limiter means is under limiting operation.

4,028,602

CONTROL CIRCUIT OF AN ELECTRIC MOTOR COMPRISING AN OUTPUT TRANSISTOR OF NPN TYPE

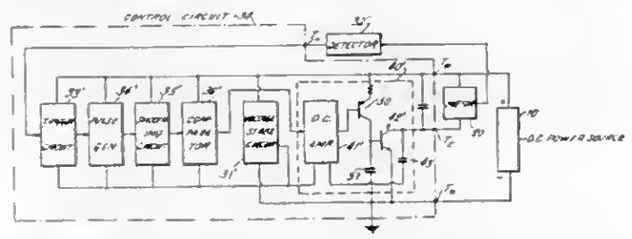
Kazuo Tokuda; Masanobu Tsugita, both of Tokyo, and Hiroshi Minakuchi, Kadoma, all of Japan, assignors to Nippon Electric Company, Ltd. and Matsushita Electric Industrial Co., Ltd., Japan

Filed July 9, 1975, Ser. No. 594,226

Claims priority, application Japan, July 11, 1974, 49-79951

Int. Cl.² H02P *5/12*

U.S. Cl. 318—345 B **9 Claims**



1. A circuit for controlling actual speed of an electric motor, the circuit being provided with first, second, third and fourth terminals, the first and second ones being respectively connected to positive and negative terminals of a d.c. power source, the first and third ones being coupled to the electric motor of which actual speed is supplied to the fourth one in the form of an electric frequency signal, wherein the improvement comprises:

first means connected between said first and second terminals for supplying a stabilized voltage which is stabilized in reference to a potential fed to the first terminal and which is arbitrarily varied relative to ground;

second means connected to the first means and responsive to said frequency signal representative of said actual speed of the electric motor for generating a difference signal for adjusting the actual speed of the motor to a desired value;

third means responsive to said difference signal for amplifying said difference signal and applying the amplified signal to said motor as a control signal, said third means comprising an output transistor of npn type provided with a base, an emitter and a collector and a level shift circuit coupled between said output transistor and said second means, said level shift circuit being resposive to said difference signal to provide a level shifted d.c. signal to the base of said npn transistor, said level shifted d.c. signal being independent of any variation of said power source, said emitter and collector of said output transistor being respectively connected to said second and third terminals.

4,028,603

DEVICE FOR DETECTING AND POSITIONING A MOBILE OBJECT CAPABLE OF MOVING IN AT LEAST ONE GIVEN PATH

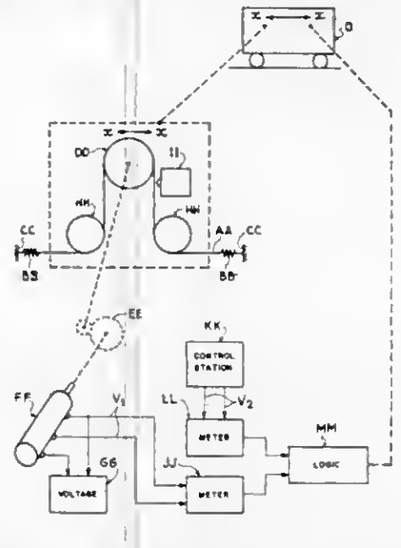
Gabriel Selam, 161, Boulevard Edouard Vaillant, 93 Aubervilliers, France

Continuation-in-part of Ser. No. 381,070, July 20, 1973. This application June 24, 1975, Ser. No. 589,946

Claims priority, application France, July 31, 1972, 72.27550; Dec. 7, 1972, 72.43528

Int. Cl.² G05D *4/00*

U.S. Cl. 318—587 **30 Claims**



1. Apparatus in combination with and for detecting the position of a heavy mobile object, such as a travelling crane, hoisting device or the like, capable of moving along at least one given pathway, said apparatus comprising:

an elongated information-bearing support with means for mounting it so as to extend in a direction parallel with and in the general vicinity of the pathway;

said information-bearing support having distance information data provided thereon;

a distance or position sensor with means for resiliently mounting it on said heavy mobile object so that said information data is capable of being correctly scanned by said sensor when the said object moves along said pathway and irrespective of any irregularities or deformations of pathway due in particular to movement of said heavy mobile object thereon;

means associated with said sensor for producing distance signals relating to the instantaneous position of said heavy object in response to detection of the information by said sensor;

said distance information data being recorded on said information-bearing support in at least two parallel bands having different distance scales, said parallel bands being capable of being scanned by said sensor, and

a control circuit operatively connected to said sensor and capable of using said distance signals to control operation of said heavy mobile object.

SERVO-MOTOR CONTROL SYSTEM

Masaaki Togo, Kawasaki; Masao Shima, Tokyo, and Kiyoshi Mochizuki, Kamakura, all of Japan, assignors to Yamatake-Honeywell Company Limited, Tokyo, Japan

Filed June 25, 1975, Ser. No. 590,209

Claims priority, application Japan, July 9, 1974, 49-75385

Int. Cl.² H02K *37/00*; **G05B** *11/18*

U.S. Cl. 318—596 **6 Claims**

1. A servo-motor control system for driving a servo-motor in an analog servo-system comprising in combination:

a comparator circuit having two input means and an output means;

means for generating a set point signal which periodically and continuously varies between predetermined limits;

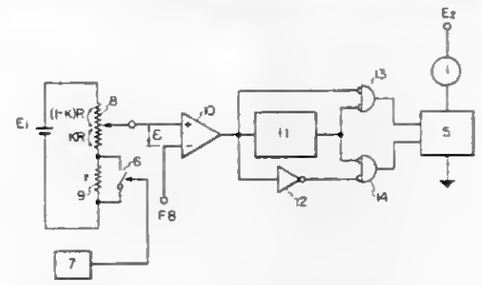
means for coupling said set point signal generator to one input means of said comparator;

means for coupling a feedback signal to the other input means of the comparator;

means for energizing said servo-motor;

means responsive to the output of said comparator for coupling said energizing means to said motor;

said responsive means coupling said energizing means to said motor for rotation in one direction when the difference between the feedback signal and the set point signal exceeds a predetermined percentage of the variation of the set point input to the comparator;



said responsive means coupling said energizing means to said motor for rotation in the opposite direction when the difference between the set point signal and the feedback signal is less than a negative quantity equal to a predetermined percentage of the variation of the set point signal; and

said responsive means disconnecting said energizing means from said motor when the difference between said set point signal and said feedback signal is less than a predetermined percentage of the variation in the set point signal.

4,028,605

SYSTEM FOR PASSING PRODUCTS TO BE TREATED THROUGH A MACHINE

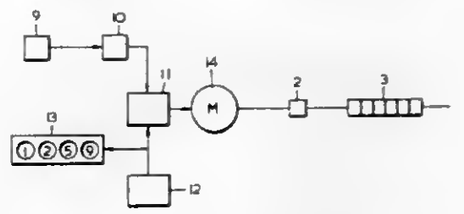
Geurt J. Ruumpol, Wilp, Netherlands, assignor to Veco Beheer Electroformlog/Photo Etching B.V., Eerbeek, Netherlands

Filed Jan. 29, 1975, Ser. No. 545,004

Claims priority, application Netherlands, Feb. 8, 1974, 7401788

Int. Cl.² H02K *37/00*

U.S. Cl. 318—696 **4 Claims**



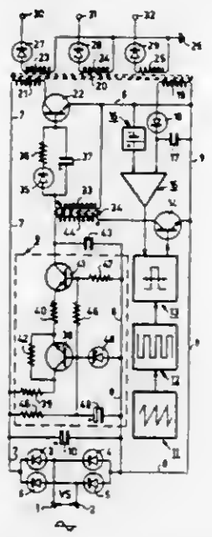
1. In a system for passing products to be treated through a machine, comprising a driving motor of the stepping type, a plurality of rollers driven by said motor, and a regulating circuit for controlling the driving motor, the improvement wherein the regulating circuit comprises a constant frequency oscillator, a fixed divider into which the output of said oscillator is fed, a variable frequency divider subject to the output of said fixed divider for providing a rectangular output for energizing the driving motor, and means for adjusting said variable frequency divider.

4,028,606

CONTROL CIRCUIT FOR A SWITCHED-MODE POWER SUPPLY, PARTICULARLY FOR A TELEVISION RECEIVER

Daniel Beuchée, Paris, and Alain Leclair, Poissy, both of France, assignors to U.S. Philips Corporation, Briarcliff Manor, N.Y.

Filed Dec. 10, 1975, Ser. No. 639,277
Claims priority, application France, Dec. 20, 1974, 74.42250
Int. Cl.² H02M 3/335
U.S. Cl. 321—2 8 Claims



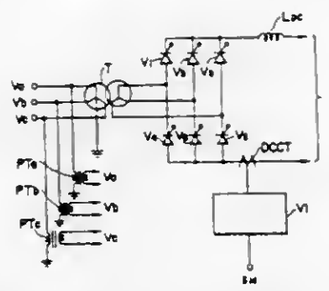
1. A control circuit for a switched-mode power supply, said power supply comprising a non-regulated rectified DC voltage source, a driver transistor, a first transformer having primary and secondary windings, an end of said primary being coupled to the collector-emitter path of said driver transistor, a switching transistor having a base coupled to said secondary, a second transformer having a primary winding coupled in series with said switching transistor, and a plurality of secondary windings, said control circuit comprising a first additional transistor having a collector coupled to the remaining end of the primary winding of the first transformer not connected to the driver-transistor and an emitter coupled to the non-regulated direct voltage source.

4,028,607

INVERTER CONTROL SYSTEM

Atsumi Watanabe, Hitachi, Japan, assignor to Hitachi, Ltd., Japan

Filed Apr. 8, 1975, Ser. No. 566,091
Int. Cl.² H02M 7/00
U.S. Cl. 321—5 8 Claims



1. In a control system for an inverter connected to an A.C. system through a transformer for the inverter, an improved inverter control system comprising:

first means for receiving a control voltage and for generating, at an advanced control angle, phase-shifted gate pulses in synchronism with voltages in-phase with commutation voltages applied to said inverter during the normal condition of said A.C. system, and for applying said gate pulses to respective arms of said inverter at a fixed interval; and

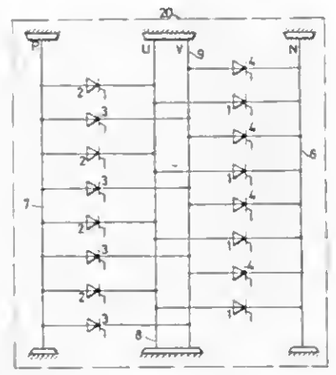
second means, responsive to a change in at least one of the phase voltages and line voltages of said A. C. system, for correcting said control voltage in accordance with said change.

4,028,608

BRIDGE CIRCUIT ARRANGEMENT ON ELECTRICAL FREQUENCY CONVERTERS WHICH CAN BE FED WITH A D.C. CURRENT

Hans Matthes, and Erhard Mauler, both of Wermelskirchen, Germany, assignors to AEG-Elotherm G.m.b.H., Remscheid, Germany

Filed Feb. 19, 1976, Ser. No. 659,403
Claims priority, application Germany, Feb. 20, 1975, 2507316
Int. Cl.² H02M 7/00
U.S. Cl. 321—8 R 3 Claims



1. In a bridge circuit for an electric frequency converter that can be fed with direct current for converting direct current into alternating current comprising:

four contact rails,

means for mounting said rails substantially in parallel to one another and insulated electrically from one another to form a mechanical frame,

said rails forming four corner points of the bridge circuit, two of which as feed rails can be connected with a source of direct current and two of which as load rails can be connected with an output of the frequency converter,

four *n* controllable semiconductor switches *n* of which are always switched conductive in an arm of the bridge circuit in an electrical parallel circuit and are attached at a distance from one another to said contact rails so that between the rails in the plane of said rails, essentially parallel paths of the current flow via the semiconductor switches,

the improvement wherein said semiconductor switches are disposed in the frame of said four rails in such a way that locally adjacent and parallel running paths of the current flow always belong to different arms of the bridge and to arms of the bridge which are adjacent to the two feeder points of the bridge.

4,028,609

DIGITAL FIRING PULSE GENERATOR WITH PULSE SUPPRESSION

Richard L. Detering, Buffalo, N.Y., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

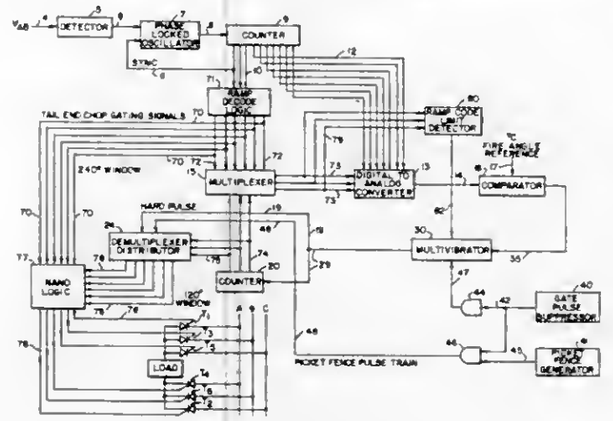
Filed Dec. 22, 1975, Ser. No. 642,809
Int. Cl.² H02M 7/00
U.S. Cl. 321—5 9 Claims

1. Firing pulse generator for igniting sequentially a plurality of thyristors connected across a polyphase power supply, comprising:

timing means for establishing a firing angle by reference to a phase of said power supply;

first means responsive to said firing means for generating a hard pulse of minimum duration to set a selected one of said thyristors into conduction;

second means for freely generating a series of picket fence pulses of short duration relative to said hard pulse; and



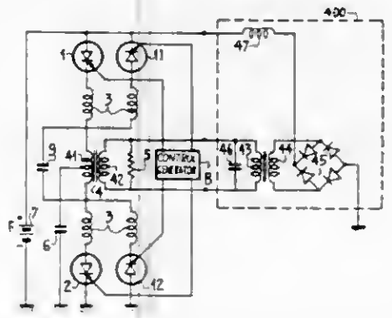
means operative sequentially in relation to said thyristors and responsive to said hard pulse for applying said hard pulse and said picket fence pulses thereafter to said selected thyristor, thereby to establish a period of conduction therefor.

4,028,610

INVERTERS SUPPLYING A HIGH FREQUENCY ALTERNATING CURRENT

Edmond Cord'homme, Paris, France, assignor to Thomson-CSF, Paris, France

Filed Aug. 18, 1975, Ser. No. 605,436
Claims priority, application France, Aug. 22, 1974, 74.28889
Int. Cl.² H02M 1/18
U.S. Cl. 321—14 4 Claims



1. In a D.C. to A.C. power inverter having input terminals connectable to a source of direct current; output terminals connectable to an alternating current load; first circuit means for connecting the input and output terminals, the first circuit means including a first pair of controlled rectifiers connected through first and second inductors; and a capacitor coupled to the midpoint between the first and second inductors and to a ground or reference potential,

second circuit means for connecting the input and output terminals, the second circuit means including a second pair of controlled rectifiers, each controlled rectifier in the second pair of controlled rectifiers being connected across a respective controlled rectifier in the first pair of controlled rectifiers and poled in the opposite direction thereto;

a detector having its output connected to the input terminals; and

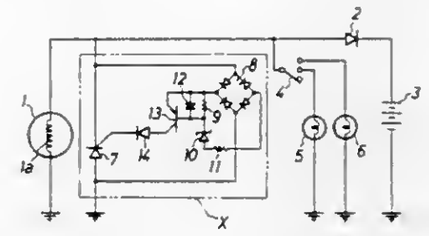
means tuned to the frequency of the alternating current and having a Q factor dependent upon the magnitude of the impedance of the alternating current load for coupling the input of the detector to the output terminals.

4,028,611

VOLTAGE STABILIZING DEVICE OF A MAGNETO ALTERNATING CURRENT GENERATOR

Minoru Tashiro, Yokohama; Shigeru Kimura, Tokyo, both of Japan, assignors to Stanley Electric Co., Ltd., Tokyo, Japan

Filed Aug. 14, 1974, Ser. No. 497,225
Claims priority, application Japan, Aug. 17, 1973, 48-6656[U]
Int. Cl.² G05F 1/44
U.S. Cl. 323—8 14 Claims



1. A voltage stabilizing device for a magneto alternating current generator (1) which is connectable to an alternating current load (5, 6) and which is further connectable to a battery (3) through a rectifier (2), comprising:

a controlled rectifier means (7), having a control electrode, connected directly in parallel with said alternating current generator (1);

a full wave rectifier circuit means (8) connected in parallel with said alternating current generator (1) and in parallel with said controlled rectifier means (7); and

a gate control circuit means coupled to an output of said full wave rectifier circuit means (8) and to said control electrode of said controlled rectifier (7) for phase controlling said controlled rectifier, said gate control circuit means comprising:

means (10, 11) for comparing an output voltage of said full wave rectifier circuit means (8) with a reference voltage and for generating a control signal when said output voltage of said full wave rectifier circuit means exceeds a given voltage level; and

delay means (9, 12) coupled to said comparing means and responsive to said control signal for generating a trigger signal with a predetermined delay after generation of said control signal;

said trigger signal being coupled to said control electrode of said controlled rectifier means (7).

4,028,612

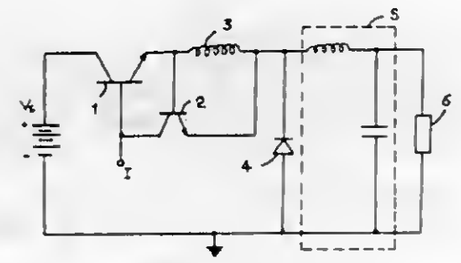
DYNAMIC CURRENT LIMITER FOR SWITCHING VOLTAGE REGULATORS

Luciano Orlando, Milan, Italy, assignor to Honeywell Information Systems Italia, Caluso, Italy

Filed Sept. 3, 1976, Ser. No. 720,151
Claims priority, application Italy, Sept. 10, 1975, 27059/75
Int. Cl.² G05F 1/56
U.S. Cl. 323—17 2 Claims

1. A dynamic current limiting circuit for a power supply, said power supply comprising a power switching transistor including a collector, a base and an emitter; a catch diode including an anode and a cathode; and an accumulator filter including capacitor and inductance means connected in parallel with said diode; said current limiting circuit comprising a feed-back transistor including collector, base and emitter elements; said collector element being connected to the base of said power switching transistor; said emitter element being

connected to the cathode of said diode; said base element being connected to the emitter of said power switching transis-



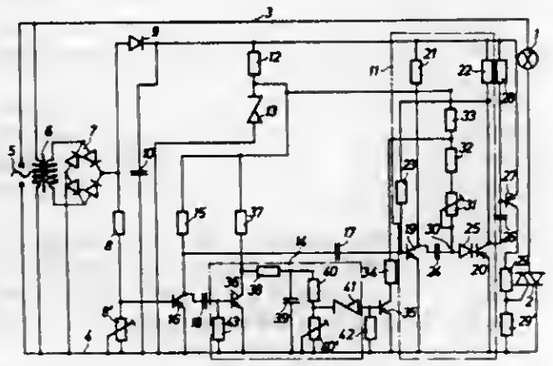
tor; and a feed-back inductance connected between said base and emitter elements of said feed-back transistor.

4,028,613

ARRANGEMENT FOR SUPPLYING A LOAD WITH CONTROLLED CURRENT FROM AN ALTERNATING CURRENT SOURCE

Armin Stiller, and Stefan Borejko, both of Braunschweig, Germany, assignors to Rollei-Werke Franke & Heidecke, Braunschweig, Germany

Continuation of Ser. No. 528,500, Nov. 29, 1974, abandoned. This application Mar. 26, 1976, Ser. No. 670,861
Claims priority, application Germany, Dec. 1, 1973, 2360048
Int. Cl.² G05F 5/00
U.S. Cl. 323—19 26 Claims



1. In an arrangement for supplying a load with constant voltage from an AC source of variable voltage amplitude, said arrangement including bidirectional thyristor means in series with said load and said source, a monostable multivibrator arranged for controlling the conductive period of said thyristor means, and means for providing said monostable multivibrator with a rectified voltage proportional to said voltage amplitude of said source, said arrangement comprising:

a. threshold switch means arranged for changing state in response to each half wave of said rectified voltage crossing a predetermined threshold value;

b. said monstable multivibrator being arranged to change to its metastable state in response to said change of state of said threshold switch means;

c. said monostable multivibrator being arranged for supplying a gating pulse to said bidirectional thyristor means for making said bidirectional thyristor means conductive for a portion of each half wave of said AC source upon the return of said monostable multivibrator to its stable state;

d. R-C circuitry for establishing the reset time for said monostable multivibrator to return to its stable state; and

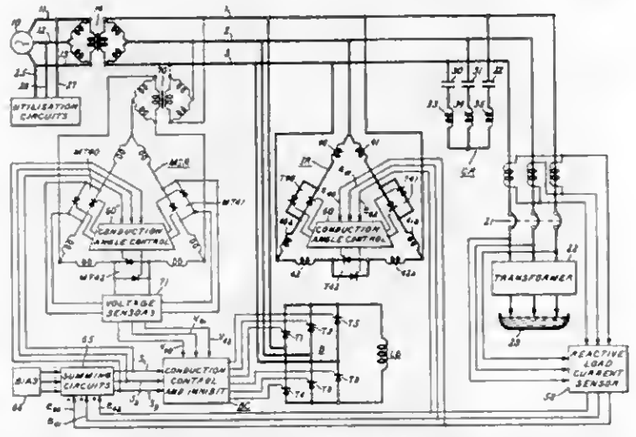
e. said R-C circuitry being connected to a constant DC voltage for varying said reset time as a function of said voltage amplitude of said source.

4,028,614

HIGH SPEED CONTROL OF REACTIVE POWER FOR VOLTAGE STABILIZATION IN ELECTRIC POWER SYSTEMS

Fred William Kelley, Jr., Media, Pa., assignor to General Electric Company, Philadelphia, Pa.

Filed May 3, 1976, Ser. No. 682,544
Int. Cl.² H02J 3/18
U.S. Cl. 323—102 16 Claims



4. Reactive current compensating apparatus for a multiphase alternating current electric power circuit having load terminals and supply conductors subject to varying and unbalanced reactive current demand at said load terminals which comprises; balanced multiphase capacitive impedance means connected in said power circuit, balanced multiphase inductive impedance means connected in parallel circuit relation with said capacitive impedance means, said capacitive and inductive multiphase impedance means drawing from said power circuit a net amount of reactive compensating current, one said multiphase impedance means being controllable variably to counteract the other and having a predetermined maximum reactive current capability supplementary single phase reactive compensating impedance means, switching means for selectably connecting said single phase impedance means in parallel circuit relation across any one selected phase arm of the multiphase impedance means of like reactance thereby to extend beyond said maximum the reactive current capability of said one phase arm, and means responsive to the reactive component of load current in each phase of a multiphase electric load connected to said load terminals for controlling said switching means.

4,028,615

METHOD OF AND DEVICE FOR TESTING HERMETICALLY ENCLOSED REED CONTACTS

Friedrich Ludwig Jansen; Frederik Hendrik Gerritsen, and Johan Hendrik Adolph Glashorster, all of Hilversum, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

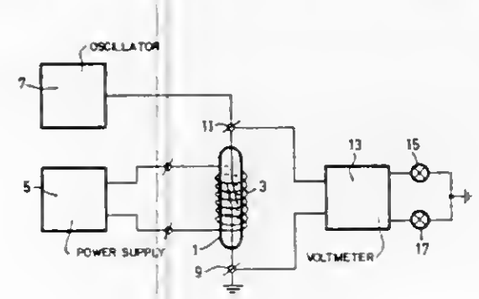
Filed Oct. 16, 1975, Ser. No. 622,997
Claims priority, application Netherlands, Sept. 1, 1975, 7510275
Int. Cl.² G01R 31/02
U.S. Cl. 324—28 RS 8 Claims

1. A method of testing contact surfaces of reed switches having electrically conductive contact reeds comprising a magnetostrictive material and susceptible to torsional movement upon application of a magnetic field by a coil within which the switch is located, comprising

applying an excitation current which is a direct current to said coil so as to close contacts of said switch,

applying an alternating test current through said closed contacts, and

continuously varying the frequency of said test current between a minimum value less than a torsional resonant



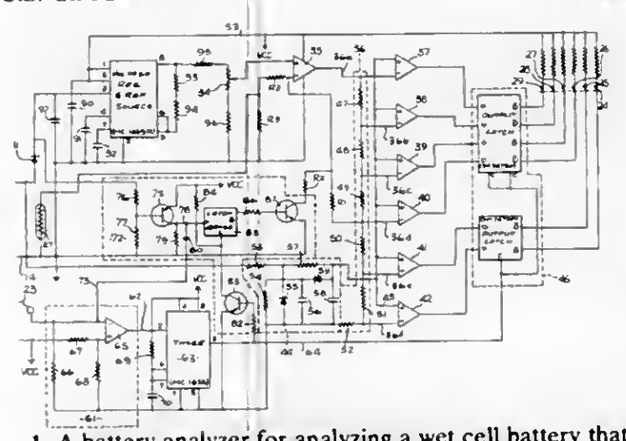
frequency of said contact and a maximum value greater than said torsional resonant frequency.

4,028,616

BATTERY ANALYZER

Carlile R. Stevens, 468 EL Rio Road, Danville, Calif. 94526

Filed Mar. 10, 1976, Ser. No. 665,519
Int. Cl.² G01N 27/42
U.S. Cl. 324—29.5 8 Claims



1. A battery analyzer for analyzing a wet cell battery that is connected to a vehicle engine, including voltmeter means for measuring the voltage from said battery within a narrow range over which the unloaded battery output will vary as a function of specific gravity of the electrolyte of said battery, said voltmeter means comprising:

a resistor voltage divider;

a circuit for providing an input reference voltage across said divider;

a plurality of voltage comparators each receiving as a first input a respective reference voltage obtained from a tap on said divider, said respective reference voltages being of incrementally greater value with respect to each other;

input network means for applying to the other input of each voltage comparator a voltage derived from the output of the battery under test;

a like plurality of indicator lamps;

an output latch connected between the outputs of said comparators and said lamps, said latch, when enabled, causing certain of said lamps to light up to indicate those comparators at which the voltage derived from said battery exceeds the respective reference voltage, said lamps thereby indicating the unloaded battery voltage and hence the electrolyte specific of the battery under test;

said circuit for providing a reference voltage comprises;

an operational amplifier having a fixed reference voltage applied to the non-inverting input, the output of said amplifier being connected across said divider as said input reference voltage;

a feedback resistor connected between a tap of said divider and the inverting input of said operational amplifier to provide negative feedback that stabilizes the voltage at said tap;

a thermistor, mounted to sense the temperature of the electrolyte of said battery under test, and connected to the inverting input of said operational amplifier to correct said input reference voltage, and hence the voltage measurement, for changes in electrolyte temperature;

a range detect and latch circuit for changing the range of said voltmeter means when the battery voltage drops under load, said range detect and latch circuit comprising;

a flip-flop;

means for setting said flip-flop to a first state when the voltage of the unloaded battery is measured, and for setting said flip-flop to a second state in response to reduced voltage from said battery when under load; and

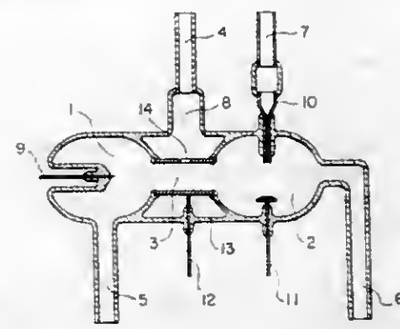
a range-change resistor and means for connecting said range-change resistor to the inverting input of said operational amplifier when said flip-flop is set to said second state, said range-change resistor thereby reducing the input reference voltage applied across said divider so that a lower voltage range is measured, said lower range corresponding to that range over which said battery will vary, when loaded, depending on the battery operational condition.

4,028,617

IONIZATION DETECTOR UTILIZING ELECTRIC DISCHARGE

Tomoichi Kamo, Hitachi, and Miklya Yamane, Kunitachi, both of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Jan. 15, 1976, Ser. No. 649,356
Claims priority, application Japan, Jan. 16, 1975, 50-6356
Int. Cl.² G01N 27/00; H01J 7/24
U.S. Cl. 324—33 17 Claims



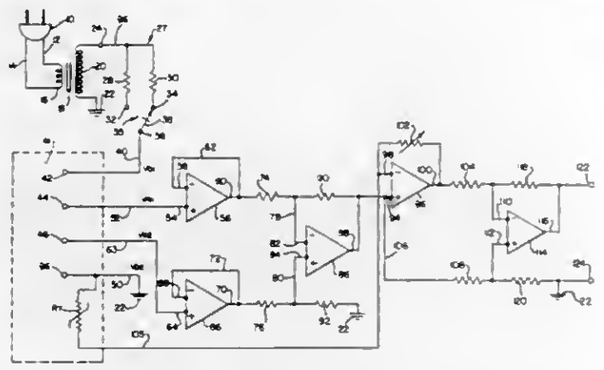
1. An ionization detector, comprising: a first chamber;a second chamber; means forming a communicating path between said first and second chambers to guide the light from said first chamber into said second chamber; means for producing an electric discharge as a light source in said first chamber, which means has a pointed discharge electrode directed toward said communicating path and a second electrode provided on at least one of said first chamber and said means forming a communicating path; inlet means for introducing a discharge gas between said first and second chambers; means for introducing a carrier gas containing a sample gas into said second chamber; outlet means for exhausting the discharge gas in said first chamber; outlet means for exhausting the carrier gas in said second chamber; and means, having a pair of collecting electrodes disposed in said second chamber, to detect the ionic current as caused by the ionization within said second chamber.

4,028,618

CIRCUIT FOR MONITORING THE CONDUCTIVITY OF A SOLUTION

Horace A. Teass, Jr., 36 Highland Terrace, Pleasantville, N.Y. 10570

Filed Jan. 9, 1976, Ser. No. 647,884
Int. Cl.² G01N *27/42*
U.S. Cl. 324—30 R **3 Claims**



1. A circuit for monitoring the conductivity of a solution comprising:

a conductivity cell having first and second drive probes and first and second receiving probes;

a constant current source connected to said first and second drive probes for supplying current thereto;

a first high impedance voltage follower amplifier connected at its input to said first receiving probe and having an output;

a second high impedance voltage follower amplifier connected at its input to said second receiving probe and having an output;

a differential amplifier having first and second inputs and an output for producing a signal proportional to the resistance and conductivity of said solution, said first input being connected to said first voltage follower output and said second input being connected to said second voltage follower output;

an operational amplifier having inverting and noninverting input being connected to said differential amplifier output;

sensing means responsive to temperature changes in said solution for producing a variable impedance; and,

feedback means for said operational amplifier including said sensing means connected between said operational amplifier inverting input and said second drive probe, whereby said operational amplifier responds to said variable impedance for maintaining said signal at a predetermined level.

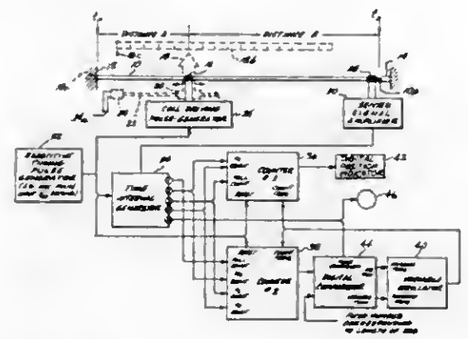
4,028,619

POSITION LOCATING USING DIGITAL LOGIC CONTROLLED BY PULSE PROPAGATION TIME INTERVALS

Gerald L. Edwards, Seattle, Wash., assignor to CX Corporation, Seattle, Wash.

Filed Sept. 22, 1975, Ser. No. 615,387
Int. Cl.² G01R *33/12*
U.S. Cl. 324—34 PS **13 Claims**

1. Apparatus for gauging location of a movable element in longitudinal relation to an elongated wave energy propagative member, comprising in combination a first transducer means positionally associated with said element and operable in energy transfer relationship with said member to induce a wave energy impulse locally in said member that propagates longitudinally therein bidirectionally from the first transducer means location, drive means operable to energize said first transducer means with an impulse having a duration a minor fraction of the time required for propagation of such wave energy impulse from end to end of the member, means terminating said member at one end thereof to reflect incident wave energy therein without phase reversal, the opposite end of said member being terminated to reflect incident wave energy therein with phase reversal, second transducer means in energy transfer relationship with said member responsive to changes in energy state of said member produced by a wave energy impulse traversing said second transducer means, said second transducer means being located adjacent to and spaced from said opposite end by a distance producing additive overlapping responses therein from incident and reflected waves traversing said second transducer means so as to provide a composite single response at substantially the instant the propagating impulse arrives at said opposite end, and time interval measurement means responsively connected to said second transducer means for deriving the location of said element from time events in the occurrences of the second transducer means composite responses first from the wave energy impulse propagating to the second transducer means directly from the first transducer means and second from that propagating to such second transducer means after reflection from said one end of the member.

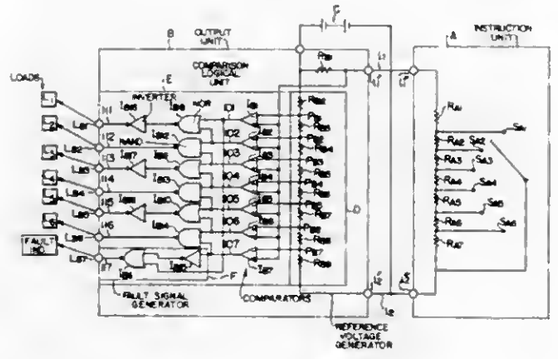


4,028,620

ELECTRICAL WIRING SYSTEM FOR SELECTIVELY ACTUATING ELECTRICAL LOADS

Junji Kitagawa, and Sigeyuki Akita, both of Okazaki, Japan, assignors to Nippon Soken, Inc., Nishio, Japan

Filed Oct. 9, 1975, Ser. No. 621,233
Claims priority, application Japan, Nov. 26, 1974, 49-136935
Int. Cl.² G01R *31/02*; H02J *1/00*; H04Q *1/08*
U.S. Cl. 324—51 **8 Claims**



7. An electrical wiring system for selectively actuating a plurality of loads when connected to respective output terminals, comprising:

a plurality of said output terminals,

electrical power means,

output terminal selection means having a single signal output line and being connected across said power means for selectively applying to said signal line a voltage having an instant magnitude uniquely corresponding to the one of the said output terminals selected by said selection means, and

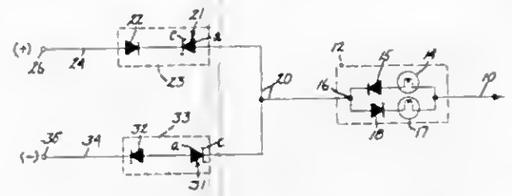
output means connected across said power means and to said signal line for generating on the basis of the instant magnitude of the voltage on said signal line a load actuating output signal at only the one of said output terminals which corresponds to said instant voltage magnitude.

4,028,621

PORTABLE AUTOMOTIVE TEST PROBE

James M. Bloxam, 133 Skyline Drive, St. Paul, Minn. 55110

Filed Dec. 18, 1975, Ser. No. 642,077
Int. Cl.² G01R *31/02, 19/14, 31/28*
U.S. Cl. 324—51 **12 Claims**



1. An automotive trouble-shooting test probe, comprising:

a. an electrically conductive probe member;

b. a first electrical terminal suitable for connection to a positive voltage output terminal of a storage battery;

c. a second electrical terminal suitable for connection to a negative or ground voltage output terminal of a storage battery;

d. a third electrical terminal;

e. a first circuit path electrically connecting said probe member with said third electrical terminal, comprising a first indicator lamp and a first current rectifying device serially connected between said probe member and said third electrical terminal for normally enabling positive current flow therethrough only in the direction from said probe member to said third electrical terminal;

f. a second circuit path electrically connected in parallel with said first circuit path between said probe member and said third electrical terminal, comprising a second indicator lamp and a second current rectifying device serially connected between said probe member and said third electrical terminal for normally enabling positive current flow therethrough only in the direction from said third electrical terminal to said probe member; and

g. a third circuit path, independent of said first and said second circuit paths, electrically connecting said first and said second terminals with said third terminal, comprising reference circuit means responsive to at least a predetermined threshold voltage level between said first or said second electrical terminals and said third electrical terminal, for establishing a fixed voltage reference level at said third electrical terminal, as measured with respect to the voltage levels present at said first and said second electrical terminals.

4,028,622

SELECTIVE INTERMODULATION DISTORTION MEASUREMENT

James Gifford Evans, and Gerald Demarest Haynie, both of Colts Neck, N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed June 28, 1976, Ser. No. 700,537
Int. Cl.² G01R *27/00*
U.S. Cl. 324—57 N **12 Claims**

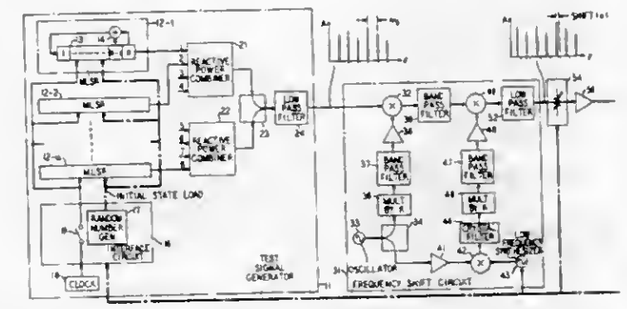
1. Apparatus for obtaining a measure of nonlinearity introduced by transmission apparatus comprising:

generating means for producing a wide bandwidth noise signal having a plurality of spectral components wherein the amplitude differences of the spectral components from the mean amplitude of all the spectral components substantially conform to a normal distribution over the frequency range of the wide bandwidth;

translating means for shifting the frequency of the noise signal by changing the frequency of each of the plurality of spectral components in the noise signal;

filtering means for substantially eliminating the spectral components in a frequency band to produce an output signal having a quiet band in the noise signal provided by said translating means;

means for applying the output of said filtering means to said transmission apparatus;



suppressing means connected to an output of said transmission apparatus for substantially reducing the faithfully delivered portion of the noise signal to reduce its strength relative to the intermodulation distortion products introduced by the nonlinearity of said transmission apparatus, and

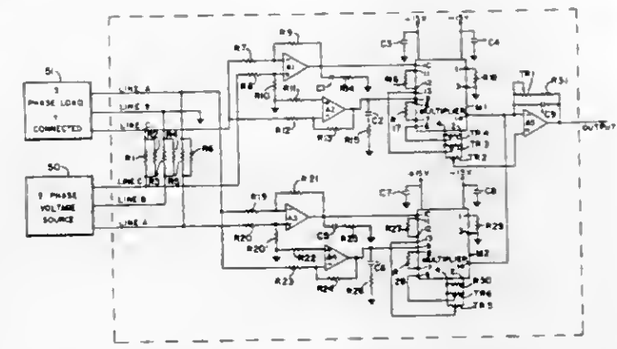
selective detecting means for resolving and indicating the level of one order of the intermodulation distortion products.

4,028,623

THREE PHASE SPIN MOTOR POWER METER

James B. Dowdle, Jr., Orlando, Fla., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Feb. 6, 1976, Ser. No. 655,932
Int. Cl.² G01R *21/00*
U.S. Cl. 324—142 **1 Claim**



1. Meter for measuring the energy flows from a 3-phase quasi square excitation source to a 3-phase load with a Y connected floating neutral comprising a plurality of first amplifier means for sensing individual phase voltages; a plurality of second amplifier means for sensing individual phase currents; a plurality of multiplier means having first and second input terminals and an output terminal whereby inputs to the first and second terminals are multiplied by each other and the result fed to an output terminal; said plurality of first amplifier means having outputs connected individually to said first input terminals of the plurality of multiplier means; said plurality of second amplifier means having outputs connected individually to the second input terminal of said multiplier means; averaging means having a plurality of inputs and an output; said

outputs of said plurality of multiplier means being fed to the input terminals of said averaging so that the output of the averaging means will be an average of the outputs of the plurality of multiplier means; resistors connected between the 3-phase source and the 3-phase load; said load having one phase connected to ground; said second means being two differential amplifiers connected individually across different ones of said resistors so as to measure the current flow therein; said first means being two amplifiers connected individually between one side of different ones of said resistors and ground so as to sense two phases of the voltages; said multiplier means are electronic chips; and said averaging means is a current to voltage converter connected to the chips so as to average current outputs from the chips and convert the current to voltage output for the meter.

4,028,624

ELECTRONIC SWITCHING ARRANGEMENT FOR A HOMING AND TRAFFIC RADIO SYSTEM

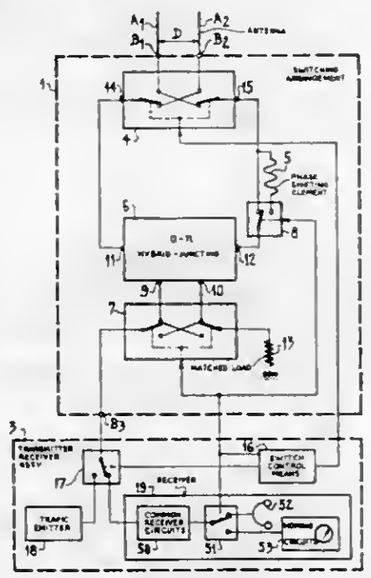
Armand Saint-Lot, Paris, France, assignor to Thomson-CSF, Paris, France

Filed Mar. 10, 1976, Ser. No. 665,392

Claims priority, application France, Mar. 11, 1975, 75.07521

Int. Cl.² H04B *1/52*

U.S. Cl. 325—23 **8 Claims**



1. An electronic switching arrangement which is intended to be fitted to a system for homing radio direction-finding and traffic radio transmission and reception, and to connect in a said system a radiating arrangement having two antennas to a transmitter/receiver to produce the two operating modes, namely homing and traffic, the said switching arrangement comprising: a first and a second terminal for connection to the said antennas respectively; a third terminal for connection to the said transmitter/receiver; and switching and phase-shifting means which are connected to the two paths extending respectively from the said first and second terminals to the said third terminal, to make these paths of the same electrical length in the traffic mode and of different lengths in the homing mode by inserting a phase-shifting device in one path and, in this latter mode, to interchange the connections at the ends of the said paths to the said first and second terminals by means of a first double, two-channel switching device, the said phase-shifting device comprising a line element determined to introduce a phase-shift of $(2\pi D)/\lambda$, λ being the wavelength and D the distance between the said antennas predetermined at most equal to a quarter of the minimum wavelength of the operating band, and a coupling device of the $0 - \pi$ hybrid junction type for coupling the said paths to the said third terminal while introducting a phase-shift of π in the said band in the homing mode and zero phase-shift in the traffic mode.

4,028,625

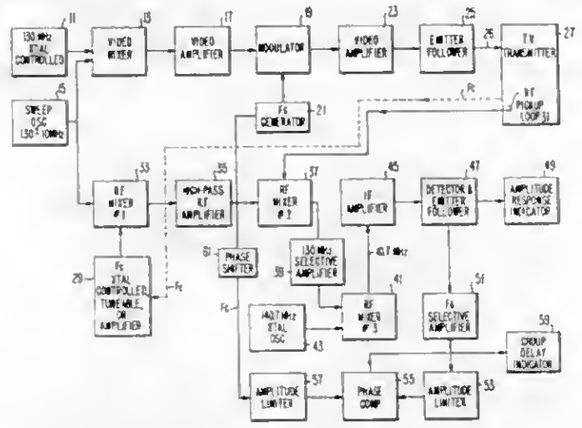
SIDEBAND ANALYZER FOR AM TRANSMITTERS

William Louis Behrend, Pittsburgh, Pa., assignor to RCA Corporation, New York, N.Y.

Filed May 5, 1975, Ser. No. 574,685

Int. Cl.² H04B *1/02*

U.S. Cl. 325—133 **8 Claims**



1. An anayzer for measuring the sideband responsc of an amplitude modulation transmitter under test over a predetermined band of frequencies comprising:

means for generating first and second frequency scan signals, the frequencies scanned over the same time period equalling said predetermined band of frequencies,

tone generator means for generating a tone,

first means responsive to said first frequency scan signal and said tone for amplitude modulating said first frequency scan signal with said tone,

coupling means for applying said first frequency scan signal amplitude modulated with said tone to said transmitter under test to produce transmitted sideband signals at sequentially changing sideband frequencies,

pick-up means to extract the modulated radio frequency signals from said transmitter,

second means including a mixer and frequency selector coupled to said pick-up means and additionally responsive to said second frequency scan signal for sequentially and individually providing at a fixed frequency said transmitted sideband signals as said second frequency scan signal scans said predetermined band of frequencies, and means including a tone detector coupled to said second means and responsive to the transmitted sideband signals at said fixed frequency for detecting the response of said tone amplitude modulated on the individual sidebands to thereby measure the individual sideband response of said transmitter under test.

4,028,626

DIGITAL DATA RECEIVER WITH AUTOMATIC TIMING RECOVERY AND CONTROL

David M. Motley, Santa Ana, and King Y. Cheng, Tustin, both of Calif., assignors to Hycom Incorporated, Irvine, Calif.

Continuation of Ser. No. 405,574, Oct. 11, 1973, abandoned, which is a continuation-in-part of Ser. No. 324,657, Jan. 18, 1973, abandoned. This application Mar. 24, 1975, Ser. No. 561,038

Int. Cl.² H04B *1/10*

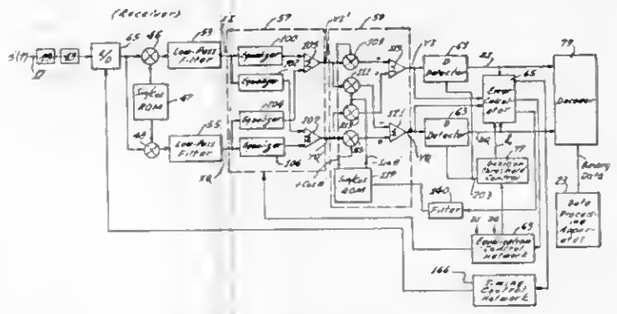
U.S. Cl. 325—324 **23 Claims**

20. A receiver for receiving and detecting a modulated analog data signal comprising:

sampling means for providing a succession of digital samples from the analog signal;

noncoherent demodulated means for producing a demodulated digital signal from the digital samples with the demodulated signal having components in first and second channels;

phase correction means for making corrections in the phase of the demodulated signal to provide a phase corrected signal having components in the first and second channels;



detecting means for providing a detected signal from the phasc corrected signal with the detected signal having components in the first and second channels;

error calculator means responsive to at least one of the phase corrected signal and the detected signal for providing an error signal; and

said phase correction means including means responsive to the error signal to update said corrections so as to reduce the phase error in the phase corrected signal.

4,028,627

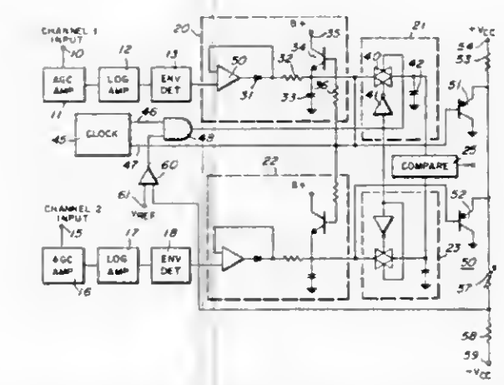
SAMPLE AND HOLD VALLEY DETECTOR

Susumu Cho, Elk Grove Village; Paul Milton Erickson, Oak Park, and Michael William Null, Schaumburg, all of Ill., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Dec. 29, 1975, Ser. No. 645,003

Int. Cl.² H04B *1/16*

U.S. Cl. 325—349 **8 Claims**



1. An audio signal quality detector comprising sample and hold valley detector means connected to receive an audio signal from the discriminator of a radio receiver, said sample and hold valley detector means comprising:

a. envelope detector means providing an output signal varying in accordance with peaks of the audio signal;

b. resettable valley detector means having an output, a signal input and a reset input for returning signals at the output to a predetermined level when a reset signal is applied to the reset input, said valley detector means including storage means for storing a signal indicative of the lowest valley applied to the signal input thereof subsequent to the last reset signal applied thereto, and the signal input of said valley detector means being coupled to receive the output signal from said envelope detector means;

c. sample and hold gate means having a signal input, an output and a rigger input for operating said gate means to store a signal indicative of the amplitude of a signal present at the signal input when a trigger signal is applied to the trigger input, said signal input being coupled to the output of said valley detector means; and

d. clock means having a first output connected to the reset input of said valley detector means and having a second output connected to the sample and hold gate means trigger input, said clock means supplying first periodic pulses at the first output and second periodic pulses, delayed from the first periodic pulses, at the second output.

4,028,628

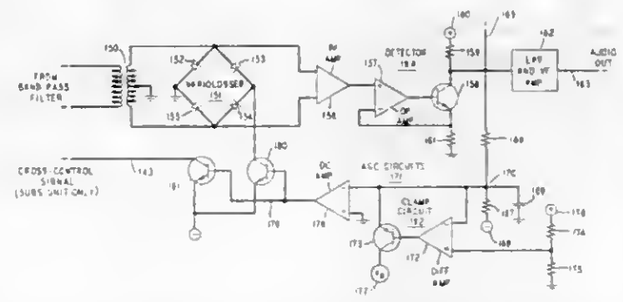
TRANSCEIVERS FOR SINGLE CHANNEL CARRIER TELEPHONE SYSTEMS

Tadikonda Narashimha Rao, Morristown, N.J., and Rouben Toumani, Teheran, Iran, assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Dec. 5, 1975, Ser. No. 638,152

Int. Cl.² H04B *1/16*

U.S. Cl. 325—400 **8 Claims**



1. A carrier receiving circuit including a variable attenuation circuit, a detector, and an automatic gain control circuit connecting the output of said detector to said attenuation circuit in order to maintain the average output of said detector at a preselected level, characterized by

a direct current clamp circuit connected to said automatic gain control circuit to clamp the output from said gain control circuit at a value close to the middle of the normal operation range of said automatic gain control circuit,

a differential amplifier for comparing the output of said detector to a preselected value, and

means responsive to said differential amplifier circuit for enabling said clamp circuit.

4,028,629

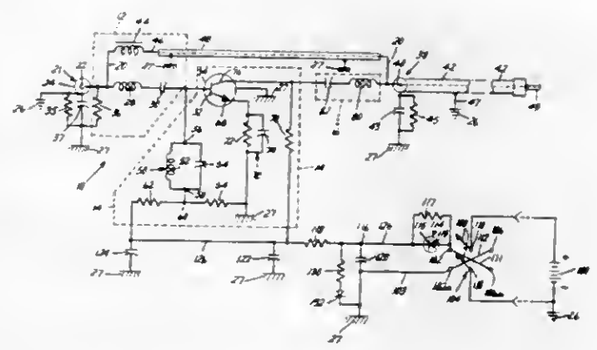
BAND PASS AMPLIFIER

Robert S. Ringland, Burlington, Iowa, assignor to Tandy Corporation, Fort Worth, Tex.

Filed Apr. 26, 1976, Ser. No. 679,882

Int. Cl.² H03F *3/04*

U.S. Cl. 330—2 **10 Claims**



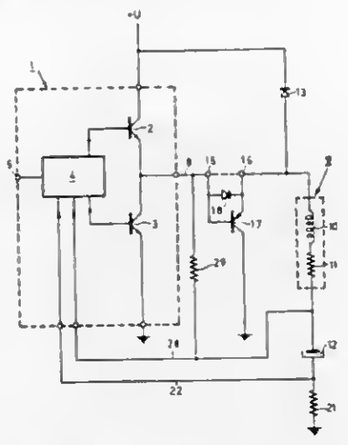
1. Apparatus comprising:

first circuit means for passing a band of frequencies and attenuating all other freqencies;
amplifying means coupled to said first circuit means having an amplifying state for amplifying said band of frequencies and a non-amplifying state;
said first circuit means and said amplifying means having a first gain spread for the frequencies in said band of frequencies, when said amplifying means is in said amplifying state and a second gain spread for the frequencies in said band of frequencies when said amplifying means is in said non-amplifying state;
switch means coupled to said amplifying means for switching said amplifying means between said amplifying state and said non-amplifying state; and
second circuit means coupled to said switch means for making said first gain spread and said second gain spread substantially equal.

4,028,630
PUSH-PULL AMPLIFIER ARRANGEMENT

Wilhelm Graffenberger, and Gerd Onken, both of Hamburg, Germany, assignors to U.S. Philips Corporation, New York, N.Y.

Continuation of Ser. No. 479,467, June 14, 1974, abandoned. This application Feb. 23, 1976, Ser. No. 660,699
Claims priority, application Germany, June 23, 1973, 2332092; Dec. 11, 1973, 2361525; Mar. 8, 1974, 2411108
Int. Cl.² H03F *3/26*
U.S. Cl. 330—15 **12 Claims**



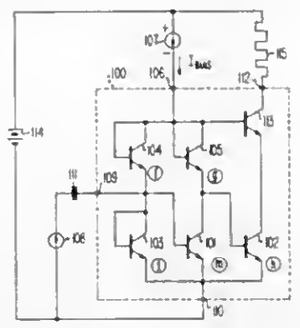
1. An amplifier circuit arrangement comprising a first and a second push-pull controllable transistor both disposed in a monolithic semiconductor body, a connection terminal point coupled to said transistors to which a load can be connected, means for applying an input signal to said transistors, and a push-pull output amplifier comprising the first transistor and a third transistor disposed outside of said body, the second transistor supplying only the base current for the third transistor.

4,028,631
CURRENT AMPLIFIERS

Adel Abdel Aziz Ahmed, Annandale, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Apr. 26, 1976, Ser. No. 680,074
Int. Cl.² H03F *3/343*
U.S. Cl. 330—19 **5 Claims**

3. A current amplifier comprising:
input, output and common terminals;
an even-numbered plurality of semiconductor junctions;
means exclusive of said semiconductor junctions for applying an input signal current between said input and common terminals;
means for forward-biasing each of said semiconductor junctions;
first and second junction transistors of the same conductivity type, each having base and emitter and collector electrodes and being operated at substantially the same temperature;
means for connecting said first transistor as a first common-emitter amplifier, including a connection without intervening elements of its base electrode to said input terminal and a connection of its emitter electrode to said common terminal;
means for connecting said second transistor as a second common-emitter amplifier in direct-coupled cascade after said first common-emitter amplifier, including a

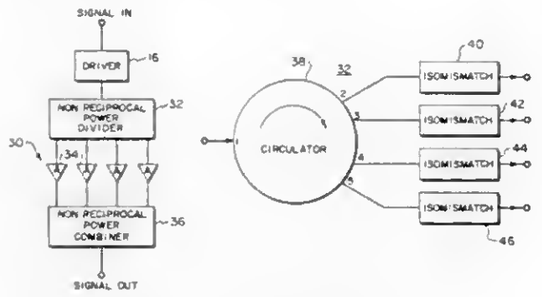


connection of its base electrode to the collector electrode of said first transistor, a connection of its emitter electrode to said common terminal and a connection of its collector to said output terminal; and
a direct coupled current feedback connection of the collector electrode of said first transistor to its base electrode through a series connection of said plurality of semiconductor junctions poled in a first direction within said series connection and the remaining half of said plurality of semiconductor junctions poled in a second direction opposite to said first direction within said series connection.

4,028,632
POWER DIVIDING AND COMBINING TECHNIQUES FOR MICROWAVE AMPLIFIERS

John L. Carter, Ocean, and Joseph McGowan, Spring Lake Heights, both of N.J., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Division of Ser. No. 522,177, Nov. 8, 1974, Pat. No. 3,928,806. This application Sept. 17, 1975, Ser. No. 614,711
Int. Cl.² H03F *3/60;* **H01P** *1/36*
U.S. Cl. 330—53 **3 Claims**



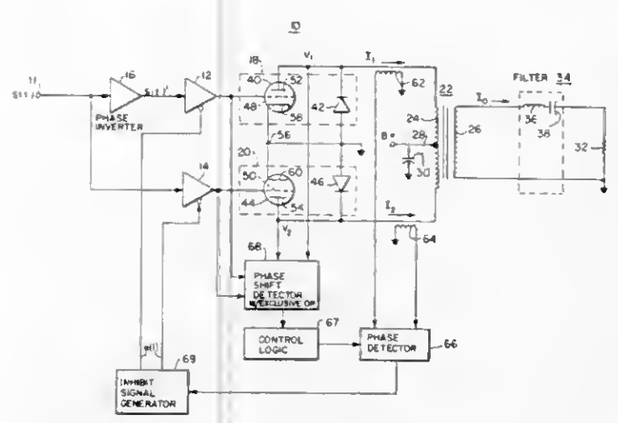
1. A power amplifier comprising:
nonreciprocal means for subdividing the power of an input microwave signal into N fractions and for isolating the N fractions from one another,
N substantially identical solid-state power amplifier units for amplifying the N fractions respectively, and
nonreciprocal means for combining the amplified fractions and emitting them as a single output,

said nonreciprocal combining means including a circulator having a plurality of input ports and one output port and a plurality of isoreflectors each having an input port and an output port,
each of said isoreflectors output ports being connected to corresponding ones of said circulator input ports,
each isoreflector being operable to transmit power received from the corresponding power amplifier unit and incident at the isoreflector input port and operable to reflect all power incident at said isoreflector output port,
said output port of the circulator providing the aforesaid single output.

4,028,633
DRIVE CONTROL TO PREVENT SIMULTANEOUS CONDUCTION IN PUSH-PULL SWITCHING AMPLIFIER

Jimmy Dale Rogers, Dallas, and Michael Earl Creecy, Richardson, both of Tex., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed July 19, 1976, Ser. No. 706,410
Int. Cl.² H03F *3/28*
U.S. Cl. 330—118 **14 Claims**

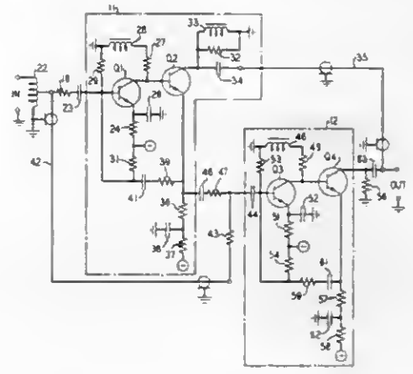


1. A push-pull amplifier comprising:
an input signal source;
first and second switching amplifier elements coupled to said input signal source and an output providing output current signals;
means for inverting said input signal to said first switching amplfier element 180° relative to said input signal applied to said second switching amplifier element;
first drive means coupling the inverted input signal to said first switching amplifier element, and second drive means coupling said input signal to said second switching amplifier element, said first switching amplifier element conducting said inverted input signal only when said first drive means is enabled, and said second switching amplifier element conducting said input signal only when said second drive means is enabled;
phase detection means to detect the phase of said output current signals; and
control means coupled to said phase detection means to provide control signals to enable one of said first and second drive means to conduct while inhibiting the other of said first and second drive means;
whereby said first and second switching amplifier elements will be prevented from simultaneous conduction and will conduct said input signal alternately at approximately 180° intervals.

4,028,634
FEED-FORWARD AMPLIFIER WITH SIMPLE RESISTIVE COUPLING

Kenneth Donald Tentarelli, Atkinson, N.H., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Feb. 11, 1976, Ser. No. 657,087
Int. Cl.² H03F *1/100*
U.S. Cl. 330—151 **7 Claims**



1. A feed-forward amplifier for amplifying electromagnetic wave signals comprising:
signal splitting means for dividing an input signal into first and second portions and applying said portions to first and second paths, respectively,
said first path including a main amplifier for producing an amplified replica of said input signal,
said amplified replica inherently including error components introduced by said main amplifier,
signal tapping means connected to said main amplifier for tapping off a portion of said amplified replica and applying it to a third path,
first signal combining means connected to said second and third paths for effecting subtraction of said second input signal portion from said amplified replica portion to produce an error signal substantially proportional to said error components, and for preventing feedback from said third path to said second path,
error amplifying means connected to said first signal combining means for amplifying said error signal, and
second signal combining means connected to said first path and said error amplifying means for effecting subtraction of said error components from said amplified replica to produce a substantially distortion-free output signal,
CHARACTERIZED IN THAT
said main amplifier has an output port with substantially zero output impedance,
said signal tapping means comprises a resistive splitting junction formed at said output port,
said error amplifying means has an input port with substantially zero input impedance, and
said first signal combining means comprises a resistive summing junction formed at said input port,
said third path introducing substantially zero phase shift between said output and input ports.

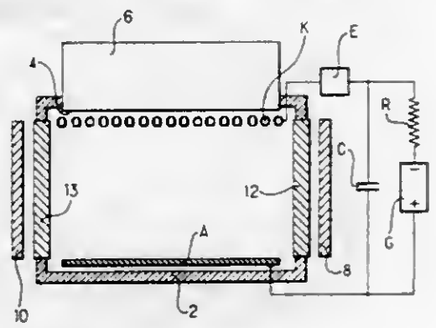
4,028,635
VIBRATION ENERGY TRANSFER LASER

Henry Brunet, L'Hay les Roses, France, assignor to Compagnie Generale d'Electricite, Paris Cedex, France

Filed Dec. 24, 1975, Ser. No. 644,008
Claims priority, application France, Jan. 15, 1975, 75.01176
Int. Cl.² H01S *3/22, 3/097*
U.S. Cl. 331—94.5 G **4 Claims**

1. In an apparatus for the stimulated emission of coherent radiation and comprising: a first gaseous molecular medium; means for exciting said first medium by supplying vibrational energy to its molecules; a second active gaseous molecular

medium; means for mixing said first and second mediums whereby vibrational energy is transferred from said first to said second medium to create a population inversion in said

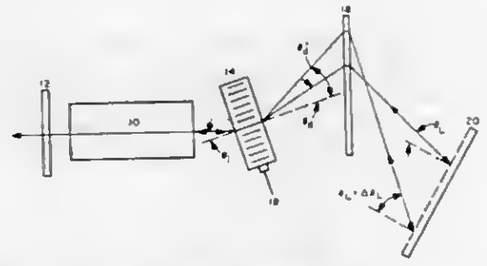


second medium; and means for stimulating the emission of coherent radiation from said second medium; the improvement wherein said second active medium is hydrogen bromide, and said first medium is nitrogen.

4,028,636
ACOUSTO-OPTICAL DEFLECTOR TUNED ORGANIC DYE LASER

Richard Swart Hughes, China Lake, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Continuation of Ser. No. 374,746, June 28, 1973, abandoned. This application Mar. 8, 1976, Ser. No. 664,784
Int. Cl.² H01S *3/10*
U.S. Cl. 331—94.5 C **6 Claims**



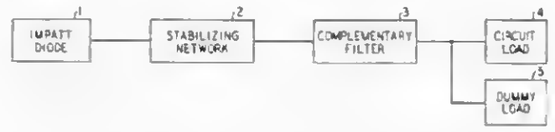
1. A laser tuning system comprising:
a laser cavity having two ends and including a laser cell emitting a band of laser light frequencies;
a laser output mirror bounding one end of said cavity;
an acousto-optic diffraction cell positioned in said laser cavity to diffract said laser light at an angle of diffraction;
means connected to said acousto-optic diffraction cell for controlling the angle of diffraction of the laser light; and
means at the other end of said laser cavity for retroreflecting, in response to said angle of diffraction, only one frequency of said band of laser light frequencies.

4,028,637
PARAMETRICALLY-STABLE NEGATIVE RESISTANCE DIODE CIRCUIT

James Walter Gewartowski, Allentown, and William Edward Schroeder, Coopersburg, both of Pa., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed June 14, 1976, Ser. No. 695,584
Int. Cl.² H03F *3/10;* **H03B** *5/12*
U.S. Cl. 331—107 R **10 Claims**

1. A parametrically-stable microwave circuit comprising:
a negative resistance diode for generating microwave signals;
a stabilizing network coupled to said diode for presenting to said diode a predetermined impedance over a broad range of frequencies including a low frequency and an operating frequency, thereby suppressing spurious oscillations in the circuit; and

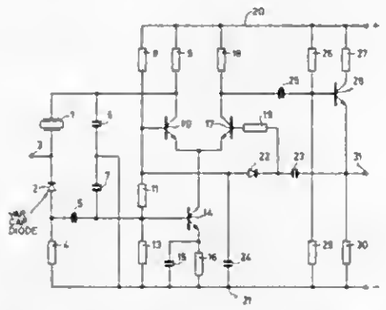


means coupled to said network for selectively coupling said signals to a dummy load or a circuit load and presenting to said network a substantially constant impedance from said low frequency to the operating frequency.

4,028,638
STABILIZED CRYSTAL CONTROLLED OSCILLATOR

Allistair Towle, Willowdale, Canada, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Mar. 15, 1976, Ser. No. 666,603
Claims priority, application Canada, Mar. 20, 1975, 222663
Int. Cl.² H03B *3/02, 5/36*
U.S. Cl. 331—109 **6 Claims**



1. An oscillator comprising a first transistor amplifier, a tuned resonant circuit means for feeding an oscillatory voltage to said first transistor amplifier, said amplifier having a low impedance load circuit including a pair of transistors coupled in differential amplifier arrangement, the transistors of the pair having a common emitter circuit, one of said pair of transistors being coupled to feed amplified oscillatory voltage back to said resonant circuit to maintain oscillation therein, a rectifier system, the other of said pair of transistors being coupled for feeding amplified oscillatory voltage to said rectifier system to produce a pair of opposed direct current control voltages, and means to supply said direct current control voltages to the control electrodes of the pair of transistors with such polarity as to reduce the conductivity of said one transistor of the pair and increase the conductivity of the other transistor of said pair.

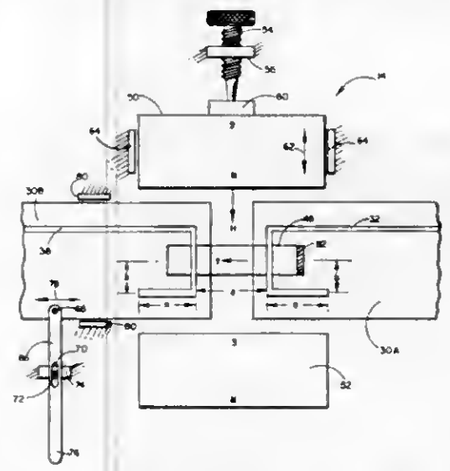
4,028,639
OSCILLATOR USING MAGNETOSTATIC SURFACE WAVE DELAY LINE

Peter J. Hagon, Corona del Mar, and John Haworth, Placentia, both of Calif., assignors to Rockwell International Corporation, El Segundo, Calif.

Filed Oct. 3, 1975, Ser. No. 619,268
Int. Cl.² H03B *5/32*
U.S. Cl. 331—107 A **2 Claims**

1. A tunable variable frequency oscillator comprising:
amplifier means having an input port and an output port for an electrical signal; and
magnetostatic surface wave delay line means for controlling the frequency of said electrical signal interconnected in a feedback path coupled around said amplifier means from the output port thereof to the input port thereof, said magnetostatic surface wave delay line means comprising:

a magnetostatic surface wave propagating medium having a substantially planar propagation surface,
magnetic means for establishing a bias magnetic field having a magnetic field intensity substantially parallel to said propagation surface;
input microstrip coupling means adjacent said propagation surface for receiving said electrical signal from the output port of said amplifier means and for causing a magnetostatic disturbance on said propagation surface in response to said electrical signal;
said input microstrip coupling means having an orientation with respect to said propagation surface and said magnetic field intensity which causes said magnetostatic disturbance to propagate along said propagation surface in a direction perpendicular to said magnetic field intensity; and
output microstrip coupling means adjacent said propagation surface and displaced from said input coupling means for sensing said magnetostatic disturbance propagated thereto from said input coupling means whereby said electrical signal is re-established in said output



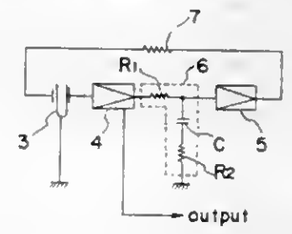
coupling means for connection to the input port of said amplifier means;
said microstrip coupling means each comprising:
a ground plane of conductive material;
a substrate of dielectric material positioned adjacent said ground plane; and
a narrow strip of conductive material deposited on said substrate wherein said substrate is interposed between said strip of conductive material and said ground plane;
means for moving said magnet means relative to said magnetostatic surface wave propagating medium to vary the intensity of the magnetic field at said magnetostatic surface wave propagating medium to vary the frequency of oscillation of said oscillator;
means for moving at least one of said microstrip couplers with respect to the other of one of said microstrip couplers and said magnetostatic surface wave propagating medium to vary the displacement of said microstrip couplers from each other to vary the frequency of oscillation of said oscillator.

4,028,640
PIEZO-ELECTRIC TUNING FORK OSCILLATION CIRCUIT

Takeshi Nakamura, Hakui, Japan, assignor to Murata Manufacturing Co., Ltd., Kyoto, Japan

Filed Mar. 12, 1976, Ser. No. 666,268
Claims priority, application Japan, Mar. 13, 1975, 50-30756
Int. Cl.² H03B *5/36*
U.S. Cl. 331—116 R **5 Claims**

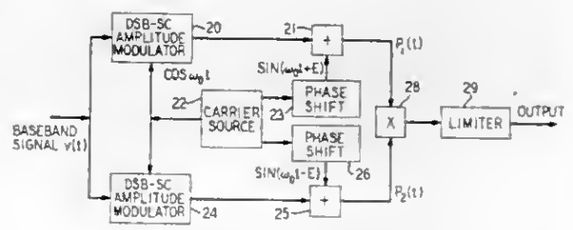
1. A piezo-electric tuning fork oscillation circuit which comprises a piezo-electric tuning fork and an external circuit coupled to said piezo-electric tuning fork, said external circuit being provided with a phase correction-circuit including resistor and capacitor elements, with said phase correction circuit having phase characteristics wherein the oscillation frequency coincides with the center frequency of the piezo-electric tuning fork over a wide frequency range, with the phase shift angle of said phase correction circuit being adapted to increase with increase of the frequency for producing stable oscillation having the maximum oscillation output obtainable from said phase correction circuit.



4,028,641
LINEAR PHASE MODULATOR INCLUDING A PAIR OF ARMSTRONG MODULATORS

William Fred Bodtmann, Middletown, and Clyde Leslie Ruthroff, Holmdel, both of N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed May 11, 1976, Ser. No. 685,407
Int. Cl.² H03C *3/40*
U.S. Cl. 332—18 **6 Claims**



1. A method of generating a phase modulated signal having essentially no even-order and third-order nonlinearities, comprising the steps of:
a. concurrently modulating an input signal with a first carrier signal in a first and a second suppressed-carrier modulator arranged in separate parallel paths for generating first and second output signals, respectively;
b. adding to each of said first and second output signals a second and a third carrier signal, respectively, for generating respective third and fourth output signals, said second and third carrier signals comprising the same frequency as said first carrier signal while differing in phase from quadrature by preselected equal and opposite amounts; and
c. combining said third and fourth output signals in a multiplier circuit for generating the phase modulated signal having essentially no even-order and third-order nonlinearities.

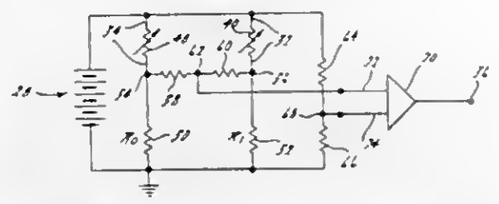
4,028,642
CIRCUIT FOR CONVERTING A TEMPERATURE DEPENDENT INPUT SIGNAL TO A TEMPERATURE INDEPENDENT OUTPUT SIGNAL

Toshimoto Kushida, Dearborn, and Eleftherios M. Logothetis, Birmingham, both of Mich., assignors to Ford Motor Company, Dearborn, Mich.

Division of Ser. No. 494,269, Aug. 2, 1974, Pat. No. 3,915,135, which is a division of Ser. No. 375,993, July 2, 1973, Pat. No. 3,868,846. This application Oct. 3, 1975, Ser. No. 619,344

Int. Cl.² G01R *17/02*

U.S. Cl. 323—75 B **5 Claims**



1. A bridge circuit, for use in conjunction with a variable resistor whose resistance varies predictably in response to a sensed parameter and which varies by a factor of K_1 in response to a parasitic parameter, to generate an output signal which is independent of the parasitic parameter comprising:

a voltage source connected to the variable resistor;

a first resistance connected in series relationship with the variable resistor and said source operative to provide a first electrical circuit;

a first voltage divider connected to said source in parallel with said first circuit, said first voltage divider having at least one fixed resistance connected in series with at least one variable resistance;

said at least one variable resistance selected to be variable only in response to the parasitic parameters and arranged to provide a voltage at the junction of the at least one fixed resistance and the at least one variable resistance which varies by a factor of K_2 in response to the parasitic parameter, K_2 being inversely related to the voltage variation demonstrated at the junction of the variable resistor and said first resistance in the presence of the parasitic parameter; and

second voltage divider means comprising second and third fixed resistances connected in series to form a signal terminal therebetween, said second fixed resistance also connected to the junction of the variable resistor with said first resistance and said third fixed resistance connected to the junction of said at least one variable resistance with the at least one fixed resistance.

4,028,643
WAVEGUIDE HAVING STRIP DIELECTRIC STRUCTURE

Tatsuo Itoh, Menlo Park, Calif., assignor to University of Illinois Foundation, Urbana, Ill.

Filed May 12, 1976, Ser. No. 685,627

Int. Cl.² H01P *3/16, 3/20, 5/18, 7/00*

U.S. Cl. 333—6 **25 Claims**

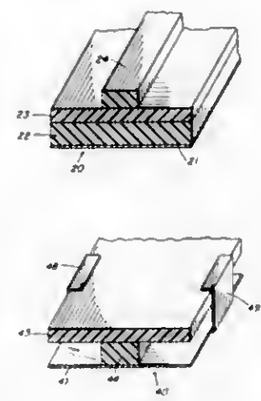
1. A microwave waveguide, comprising:

a conductive ground plane;

a first dielectric layer disposed on a surface of said ground plane;

a second dielectric layer overlaying said first dielectric layer, said second dielectric layer having a higher dielectric constant than said first dielectric layer; and

an elongated dielectric strip formed on said second dielectric layer, said strip having a width which is substantially less than that of said second dielectric layer said strip being formed of material having a dielectric constant



which is less than the dielectric constant of said second dielectric layer.

4,028,644
SYSTEM EQUALIZATION FOR REPEATERED SUBMARINE CABLE SYSTEM

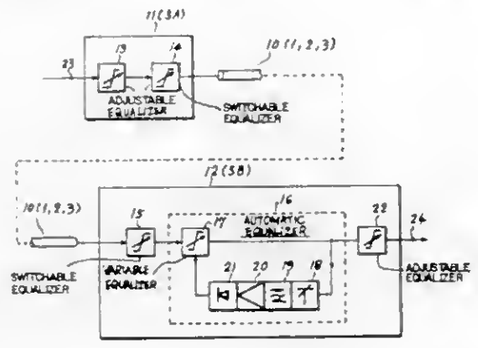
Yasuhiko Niiro, Tokyo, Japan, assignor to Kokusai Denshin Denwa Kabushiki Kaisha, Japan

Filed Dec. 9, 1975, Ser. No. 639,107

Claims priority, application Japan, Dec. 16, 1974, 49-144287

Int. Cl.² H03H *7/16*; **H04B** *3/10*

U.S. Cl. 333—16 **6 Claims**



1. A system equalizer, for use in a repeatered submarine cable system including automatic gain controlled submerged of a temperature following type, comprising:

a switchable equalizer connected to a repeatered submarine cable system including automatic gain controlled submerged repeaters of a temperature following type and switchable to select an optimum one of a plurality of loss-frequency characteristics corresponding to the total of compensation errors in said automatic gain controlled submerged repeaters to compensate for a seasonal misalignment of the repeatered cable system;

an automatic equalizer, including pilot signal detecting means for detecting a pilot signal transmitted through the repeatered cable system and for developing a control signal representative of the detected pilot signal, and connected to said switchable equalizer and having a loss-frequency characteristic proportional to the square root of frequency to compensate for short-term level fluctuations of the repeatered cable system under control of the control signal developed by said pilot signal detecting means; and

an adjustable equalizer connected to said automatic equalizer to compensate for an unknown fixed deviation developed at an output of said automatic equalizer.

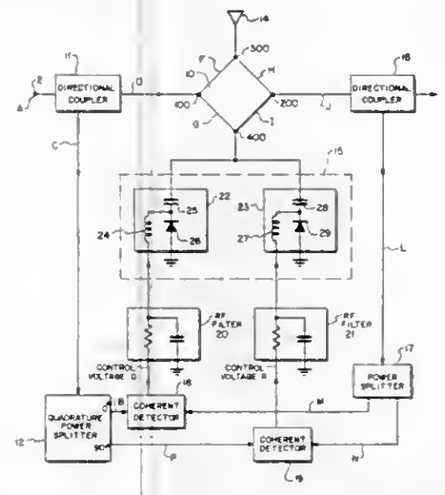
4,028,645
AUTOMATIC IMPEDANCE MATCHING USING RESISTIVE AND REACTIVE DIODES

Frank J. Tressa, Deer Park, N.Y., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed June 21, 1976, Ser. No. 698,447

Int. Cl.² H03H *7/40*

U.S. Cl. 333—17 M **7 Claims**



7. An automatic impedance matching circuit for maintaining isolation between two opposite ports of a four port hybrid in spite of random impedance variations at a third port said hybrid comprising:

means to sample the signals at both of the two said opposite ports;

coherent detector means coupled to said sampling means for deriving two DC signals related to the amount of leakage between said opposite ports;

an electronically variable impedance, connected to the fourth port of said hybrid; and

means to electronically vary said variable impedance in response to said DC signals in such a manner as to minimize the coupling between said opposite ports.

4,028,646
ELASTIC SURFACE WAVE DEVICES AND METHOD FOR MAKING THE SAME

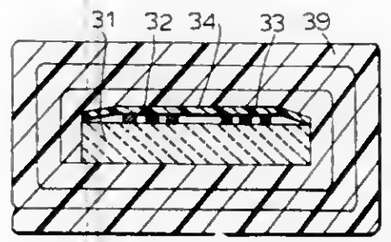
Hiroshi Ikushima, Katano; Yasuo Nakajima, Osaka; Kitokazu Hagiwara, Hirakata, and Takashi Nagata, Ikeda, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Filed Dec. 29, 1975, Ser. No. 645,288

Claims priority, application Japan, Dec. 30, 1974, 50-1021; Mar. 20, 1975, 50-34106

Int. Cl.² H03H *9/26, 9/30, 9/10*; **H01L** *41/22*

U.S. Cl. 333—72 **24 Claims**



1. A surface elastic wave device comprising a resin casing having embedded therein a unitary body comprising: a piezoelectric plate; a transmitting interdigital transducer and a receiving interdigital transducer attached on one major surface of said piezoelectric plate, each transducer comprising a pair of electrodes facing each other, a wave propagation surface for a surface elastic wave being thereby defined on said major surface of said piezoelectric plate between said transducers; a thin film coextensive with said propagation surface and in contact with both of said transducers for preventing said surface elastic wave from being transferred from said wave propagation surface to said resin casing; and two pairs of electrical leads, the leads of one pair of which are respectively connected to the electrodes of said pair of electrodes of said transmitting transducer and the leads of the other pair of which are respectively connected to the electrodes of said pair of electrodes of said receiving transducer, all of said electrical leads being out of contact with said wave propagation surface.

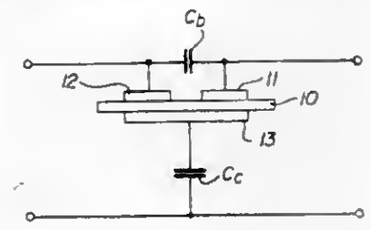
4,028,647
MONOLITHIC CRYSTAL FILTERS

Henry Kai-Hen Yee, Montreal, Canada, assignor to Northern Telecom Limited, Montreal, Canada

Filed Apr. 29, 1976, Ser. No. 681,438

Int. Cl.² H03H *9/26, 13/00, 7/08*

U.S. Cl. 333—72 **9 Claims**



1. A monolithic bandpass filter unit having an upper and a lower stopband comprising a monolithio piezoelectric substrate substrate having two adjacent electrodes on one surface thereof constituting two bilateral terminals of said filter unit, and a common electrode on the other surface opposite said two electrodes, whereby the resulting structure acts as a pair of coupled resonators; predetermined coupling capacitance between said two adjacent electrodes; and a capacitor interconnecting said common electrode and a common terminal of said filter unit and adapted, in cooperation with said coupling capacitance, to introduce a pair of finite poles one in each of the stopbands of said filter unit.

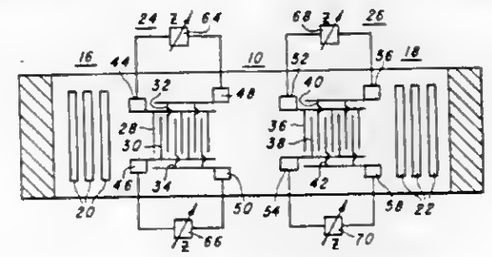
4,028,648
TUNABLE SURFACE WAVE DEVICE RESONATOR

Clinton S. Hartmann, and Robert E. Stigall, both of Richardson, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Filed Mar. 8, 1976, Ser. No. 665,015

Int. Cl.² H03H *9/02, 9/26, 9/32, 13/00*

U.S. Cl. 333—72 **18 Claims**



1. A tunable surface wave resonator comprising:

a piezoelectric substrate;

a pair of reflector arrays on said substrate, said reflector arrays being aligned in spaced parellel relation to each other and respectively disposed at the opposite outer extremities of said substrate so as to provide a multiresonant cavity therebetween;

each of said reflector arrays comprising a plurality of spaced parallel discontinuities formed on said substrate,

tuning means formed on the substrate in the miltiresonant cavity, said tuning means being independent of said reflector arrays and selectively positioned as to the reflector arrays to provide selective uniform tuning for all modes of the multiresonant cavity; and

surface acoustic wave transducer means formed on said substrate and disposed between said tuning means and operably associated therewith to generate standing waves at a desired resonant frequency.

4,028,649

SURFACE ACOUSTIC WAVE FILTER

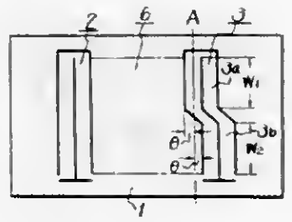
Yasutoshi Komatsu, Ayasemachi, and Yuzuru Yanagisawa, Fujisawa, both of Japan, assignors to Sony Corporation, Tokyo, Japan

Filed Dec. 19, 1975, Ser. No. 642,345

Claims priority, application Japan, Dec. 25, 1974, 50-3867; July 24, 1975, 50-90641

Int. Cl.² H03H *9/04, 9/26, 9/32*; **H01L** *41/10*

U.S. Cl. 333—72 **6 Claims**



1. A surface acoustic wave filter comprising:

a. a piezo-electric substrate having a major surface;

b. input and output transducers formed on the major surface of said substrate, each of said transducer consisting of a plurality of transducer elements; and

c. a plurality of surface acoustic wave propagation channels formed on said substrate between said input and output transducer; in which, when the width of a channel k is taken as W_k, and the phase difference between the length of the channel k and n times the wave length at the center frequency is taken as θ_k(n being a positive integer), the values of θ_k and W_k are selected to satisfy the following condition:

$$\frac{|RR'(\Sigma_k W_k e^{n\theta_k}) + (RQ' + R'Q)(\Sigma_k W_k e^{n\theta_k})(\Sigma_k W_k e^{-n\theta_k}) + QQ'(\Sigma_k e^{-n\theta_k})^2|}{|\Sigma_k W_k e^{n\theta_k}|} < 10^{-3}$$

where R and R′ are, respectively, mechanical reflection coefficients of said input and output transducers, Q and Q′ are, respectively, electrical reflection coefficients of said input and output transducers, and $\Sigma_k W_k$ is normallized as $\Sigma_k W_k = 1$, the transducer elements of said input transducer being located close together and electrically connected, and said plurality of surface acoustic wave propagation channels being formed without an overlapping area.

MICROWAVE CIRCUITS CONSTRUCTED INSIDE A WAVEGUIDE

Yoshihiro Konishi, Sagamihara; Kenichi Konno, Tokyo; Norihiko Yazawa, Kawasaki, and Norio Hoshino, Tokyo, all of Japan, assignors to Nippon Hoso Kyokai, Tokyo, Japan

Continuation of Ser. No. 361,817, May 18, 1973, Pat. No. 3,914,713. This application May 8, 1975, Ser. No. 575,512

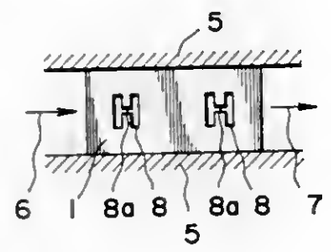
Claims priority, application Japan, May 23, 1972, 47-50993

Int. Cl.² H01P *1/20*

U.S. Cl. 333—73 W **5 Claims**

1. In combination with a waveguide having input and output openings and capable of sustaining an electric field along an E-plane parallel to the longitudinal axis of said waveguide, said waveguide having a predetermined first cut-off frequency,

a single conductive flat member mounted within said waveguide in parallel with said E-plane so as to form a cut-off region having a second cut-off frequency at a position where said single conductive flat member is inserted, said single conductive flat member having substantially the same height along the length of the member as the full inner height of said waveguide and uninterrupted straight edges adjacent the input and output openings of said waveguide,



said single conductive flat member including input and output planar circuit elements on a surface thereof adjacent the input and output openings respectively of said waveguide for coupling electromagnetic energy between said input and output openings at the second cut-off frequency, said second cut-off frequency being approximately double said first cut-off frequency when said conductive flat member is positioned substantially along the longitudinal axis of said waveguide, the input electromagnetic field being attenuated sufficiently at said second cut-off frequency to prevent coupling of electromagnetic energy directly between the input and output openings of said waveguide.

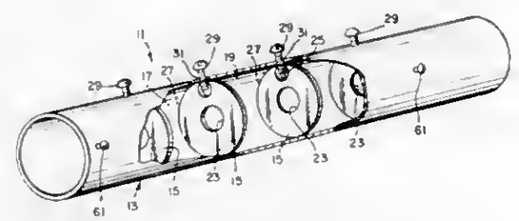
COUPLED-CAVITY MICROWAVE FILTER

Juri G. Leetmaa, Los Angeles, Calif., assignor to Hughes Aircraft Company, Culver City, Calif.

Filed May 6, 1976, Ser. No. 683,979

Int. Cl.² H01P *1/20, 5/04, 7/06, 1/16*

U.S. Cl. 333—73 W **6 Claims**



1. A coupled-cavity microwave filter providing a narrow bandwidth with precisely controlled frequency responses, comprising:

a plurality of tandemly disposed, relatively high Q cylindrical cavity filters; and

coupling means including a relatively large non-adjustable primary iris aperture for coupling adjacent ones of said cavities, said coupling means also including a relatively smaller secondary tuning aperture disposed adjacent the outer edge of said irises, each of said secondary tuning apertures containing a tuning screw extending through a wall of an associated one of said cylinders for precisely adjusting the coupling between such adjacent cavities without degrading the cavity Q's thereof.

DIELECTRIC RESONATOR AND MICROWAVE FILTER USING THE SAME

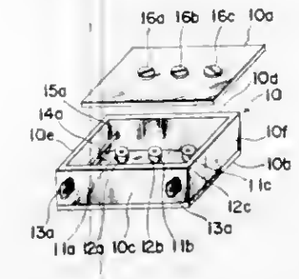
Kikuo Wakino, Muko; Toshio Nishikawa, Nagaokakyo; Sadahiro Tamura, and Youhei Ishikawa, both of Kyoto, all of Japan, assignors to Murata Manufacturing Co., Ltd., Kyoto, Japan

Filed Sept. 5, 1975, Ser. No. 610,780

Claims priority, application Japan, Sept. 6, 1974, 49-107909[U]; Oct. 12, 1974, 49-123304[U]; Jan. 22, 1975, 50-10752[U]; Jan. 27, 1975, 50-12555[U]; Jan. 27, 1975, 50-12556[U]; July 4, 1975, 50-93990[U]

Int. Cl.² H01P *7/06, 1/16, 1/20, 3/16*

U.S. Cl. 333—73 W **9 Claims**



1. A dielectric resonator which comprises a block of dielectric material and at least one aperture formed in said block, said aperture having a diameter selected to be within such a range that a substantial increase in frequency at a spurious mode having a spurious frequency adjacent a frequency at the dominant mode takes place relative to that attained by said dielectric block without said aperture, said diameter range also being such that an increase in frequency at the dominant mode relative to that attained by said dielectric block without said aperture takes place to a negligible extent, the ratio of the spurious frequency attained in the apertured dielectric resonator to that attained by the frequency at the dominant mode in said resonator being greater than about 1.3.

4,028,653

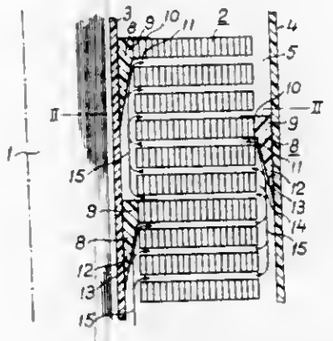
ELECTRICAL EQUIPMENT HAVING RADIAL COOLING CHANNELS WITH MEANS FOR GUIDING COOLING FLUID THROUGH THE CHANNELS

Tage Carlsson, and Wolfgang Lampe, both of Ludvika, Sweden, assignors to ASEA Aktiebolag, Vasteras, Sweden

Filed Apr. 1, 1976, Ser. No. 672,718

Int. Cl.² H01F *27/08*

U.S. Cl. 336—60 **3 Claims**



1. In electrical equipment having inner and outer insulating cylinders and a winding between the cylinders having a plurality of passages therethrough axially spaced with respect to the cylinders for passage therethrough of a cooling fluid, the winding being separated from one of the cylinders by a space, and a cooling fluid guide member in said space having first and second surfaces and having an enlarged head filling the space, said head including upper and lower flanges engaging a layer of said winding for securing said guide member to the winding, one of said surfaces engaging against the cylinder, and having a wedge-formed projection extending axially from the head with respect to the cylinders by a distance at least equal to the axial distance between two of said passages, said projection having the second surface forming with the winding a space decreasing in area towards the head, whereby the flow of cooling fluid is distributed between such passages.

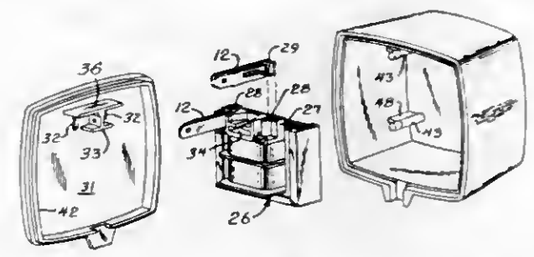
BATTERY CHARGER

Robert G. Bullard, Odell; James P. Plunkett, W. Dundee, and George F. Linning, Des Plaines, all of Ill., assignors to Coils, Inc., Huntley, Ill.

Continuation-in-part of Ser. No. 409,958, Oct. 26, 1973, abandoned. This application Jan. 7, 1976, Ser. No. 646,952

Int. Cl.² H01F *15/10*

U.S. Cl. 336—92 **10 Claims**



1. A voltage-reducing power pack including a case with a base plate having openings therein; a transformer in the case having a bobbin molded of one piece with a mounting head, said mounting head having a pair of spaced, parallel elongated slots therein; a pair of plug-in prongs having shanks respectively received edgewise in said slots; interlocking means between said mounting head and plug-in prongs preventing endwise movement of said prongs when in said slots; sturdy interlocking formations on said base plate and mounting head telescoping together as the plug-in prongs are threaded through said openings in said base plate to project normally for rigidifying the bobbin and the prongs with respect to the base plate; panel means extending from said base plate across open ends of said slots to retain said prongs in said slots; and a cover secured to the base plate and having formations thereon which engage the transformer structure in the direction of its insertion into the base plate to prevent detelescopic movement of said interlocking formations.

4,028,655

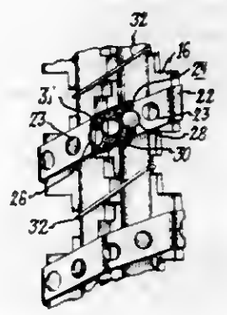
ELECTRICAL CURRENT LIMITING FUSE WITH BOUND SAND FILLER AND IMPROVED LOW CURRENT FAULT CLEARING

Robert E. Koch, Pittsfield, Mass., assignor to General Electric Company

Filed Oct. 9, 1975, Ser. No. 621,060

Int. Cl.² H01H *85/10*

U.S. Cl. 337—160 **8 Claims**



1. An electrical current limiting fuse of the type having an insulating tubular casing sealed at the ends by metal terminal

caps, at least one fusible element connected between the terminal caps and extending along the interior of the casing, and a bound matrix of sand packed inside the casing and surrounding the element, wherein the improvement comprises that;

a segment of said element approximately centrally located between said caps comprises one or more reduced surface area necks which are in addition to any regularly spaced reduced cross-section necks of said element, and

an overlay of metal having a lower fusing temperature than said element on the surface of said segment.

4,028,656

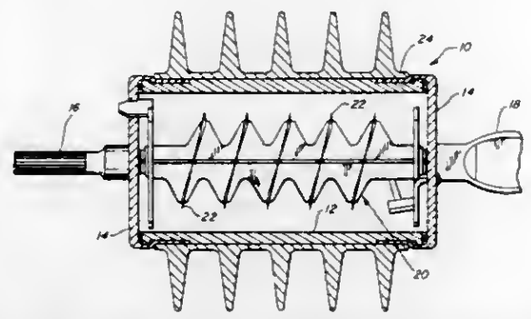
HIGH VOLTAGE FUSE WITH OUTER HEAT-SHRINKABLE SLEEVE

E. William Schmunk, Park Ridge, and Thomas J. Tobin, Morton Grove, both of Ill., assignors to S & C Electric Company, Chicago, Ill.

Filed Nov. 19, 1975, Ser. No. 633,487

Int. Cl.² H01H *85/20*

U.S. Cl. 337—186 **11 Claims**



1. In a high voltage current limiting fuse, the fuse including a relatively short hollow cylindrical housing fabricated from an electrically insulating material, end walls mounted over each end of the housing, a current responsive element positioned within the housing, and means for connecting the current responsive element to an external circuit, said housing being relatively short for the current limiting capabilities of the fuse; wherein the improvement comprises:

a hollow cylindrical sleeve fabricated from an insulating material having a dimensional memory and having surface elongating means formed on the exterior thereof for increasing the external path of the fuse, said sleeve having a coating of thermosetting plastic on the interior surface thereof and being expanded in its radial dimension, positioned around the hollow cylindrical housing and bonded to the housing by causing said sleeve to seek its original radial dimension to form a moisture proof seal therebetween.

4,028,657

DEPOSITED LAYER TYPE THERMOMETRIC RESISTANCE STRUCTURE

Walter G. Reichelt, Hanau, Germany, assignor to W. C. Heraeus GmbH, Hanau am Main, Germany

Filed Oct. 22, 1975, Ser. No. 624,964

Claims priority, application Germany, Oct. 24, 1974, 2450551

Int. Cl.² H01C *1/012*

U.S. Cl. 338—307 **12 Claims**

1. A thermometric electrical resistance structure comprising a carrier substrate consisting chiefly of aluminum oxide, an intermediate layer on said substrate and a patterned platinum layer of a configuration suitable for use as an electrical resistance provided on said intermediate layer, having the improvement that:

the platinum layer has a thickness in the range from 0.1 to 10 μm,

and the intermediate layer has a thickness in the range from 0.1 to 10 μm and is composed of an oxide material selected from the group consisting of oxides of rare earth elements, titanium oxide, iron oxide and mixtures of at least two of said oxides, whereby said oxide material, by providing electrical and mechanical stability to the structure in manufacturing heat treatment, improves the quality and reliability of the thermometric structure.

4,028,658

SAFETY DEVICE FOR AN OIL HYDRAULIC BRAKING SYSTEM

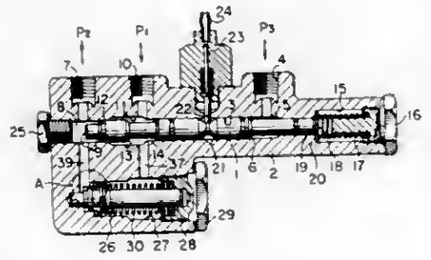
Hiroyuki Nakamura, Gotenba; Hiroshi Kawaguchi, and Kiyoshi Nishiwaki, both of Susono, all of Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyota, Japan

Filed Mar. 22, 1974, Ser. No. 453,953

Claims priority, application Japan, Nov. 13, 1973, 48-127454

Int. Cl.² B60T *8/26*

U.S. Cl. 303—6 C **5 Claims**



1. A safety device for an oil hydraulic brake system comprising a housing containing a first bore and a second bore, first, second and third ports opening into said first bore, said first, second and third ports being connected to a front master clinder, and said second and third ports communicating with said second bore through passages formed in said housing, a rear wheel cylinder and a rear master cylinder, respectively, a piston slidably disposed in said first bore, said piston having a first effective pressure-receiving surface of a first area communicating with said first port, said first surface being adapted to receive a first force exerted by the oil hydraulic pressure of the front master cylinder in a first direction, a second effective pressure-receiving surface having a second area larger than said first area and communicating with said second port, said second surface being adapted to receive a second force exerted by the oil hydraulic pressure of the rear wheel cylinder in a second direction opposite to said first direction, a land portion adapted to provide communication between said second port and said third port when said piston is displaced in said second direction, a cam portion adapted to actuate an electrical contact when said piston has been displaced in either direction, a spring adapted to exert a force to said piston in said first direction within a limited stroke, said force being not less than the balance between said second and first forces, and a proportioning means disposed in said second bore and communicating with the rear master cylinder and the rear wheel cylinder through the passages formed in said housing and said second and third ports, said proportioning means adapted to transmit hydraulic pressure of the rear master cylinder to the rear wheel cylinder with a reduced increasing rate when the hydraulic pressure of the rear master cylinder is above a predetermined level.

4,028,659

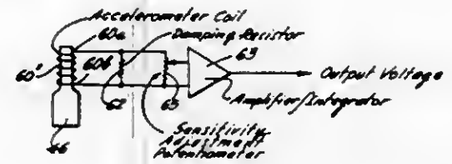
STRONG MOTION ACCELEROGRAPH WITH SELF-STARTER AND ELECTRICAL AS WELL AS LIGHT OUTPUTS

William J. Rihn, San Gabriel, Calif., assignor to Kinemetrics, Inc., San Gabriel, Calif.

Division of Ser. No. 298,536, Oct. 18, 1072, Pat. No. 3,877,256, which is a continuation-in-part of Ser. No. 96,325, Dec. 9, 1970, abandoned. This application July 5, 1974, Ser. No. 485,902

Int. Cl.² G01V *1/18*

U.S. Cl. 340—17 R **1 Claim**



1. Means to produce electrical voltage variations indicative of the intensities of earth tremors in the area in which said means is disposed, and to transmit said voltage variations to a receiving station for recording and observation, said means comprising:

a. a battery power source;

b. a radio frequency transmitter;

c. first switching means, said first switching means being connectedly interposed between said battery power source and said transmitter, and said first switching means having a first and normally set position whereby the flow of current from said battery power source to said transmitter is interdicted, and a second position to which said first switching means may be temporarily switched whereby such current flow may occur thereby to initiate operation of said transmitter;

d. a permanent magnet, said magnet providing a magnetic field about a predetermined axis;

e. a coil of wire, said coil being suspended within said field to oscillate, when jarred, along said axis, and thereby produce a flow of current in said coil;

f. current responsive relay means, the last said means being connected to opposite terminals of said coil and operatively associated with said first switching means in such manner that when current of a predetermined amperage flows in said coil, said switching means is moved from its first to its second position and retained in the latter position for a predetermined interval after current of such predetermined amperage ceases to flow in said coil;

g. second switching means, said second switching means being movable from a normally set first position, to a second position;

h. first resistance element, said first resistance element being normally connected across the opposite terminals of said coil by said second switching means in its first position, to effect electrical damping of oscillations of said coil within said magnetic field until acceleration applied to said coil shall reach a predetermined value, whereupon said first switching means is moved from its first position to its second position;

i. a second resistance element, said second resistance element being connected across the opposite terminals of said coil by said second switching means when in its second position, said second resistance element being of a different ohm value from the first resistance element, thereby to dampen the oscillation of said coil on a lesser basis than the damping effected by the first resistance element; and

j. amplifier integrator means, the input side of said amplifier integrator means being connected across said second resistance element, and the output side of said amplifier integrator means being connected to the input side of said transmitter, thereby to amplify the voltage variations generated in said coil during any oscillation thereof within said magnetic field when the second switching means is in its second position, and to deliver a current with such variations to the transmitter so that radio frequency signals corresponding to said voltage variations may be transmitted by said transmitter to said receiving station.

4,028,660

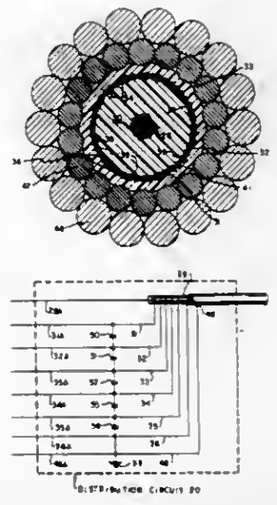
WELL LOGGING METHOD AND MEANS USING AN ARMORED MULTICONDUCTOR COAXIAL CABLE

Robert W. Pitts, Jr., Houston, Tex., assignor to Texaco Inc., New York, N.Y.

Division of Ser. No. 427,156, Dec. 21, 1973, Pat. No. 3,855,468. This application Aug. 5, 1974, Ser. No. 494,577

Int. Cl.² G01V *1/40*

U.S. Cl. 340—18 CM **11 Claims**



1. A well logging system comprising a logging tool adapted to be passed through a borehole in an earth formation, said logging tool includes means for sensing conditions in a borehole and providing at least two signals corresponding to the sensed conditions, one signal having a high frequency and at least one other signal having a low frequency; a transmission system including a shieldless armored multiconductor coaxial cable which comprises an inner conductor, a coaxial first insulator, groups of conductors arranged in a predetermined relationship to said inner conductor and separated from said inner conductor by said first coaxial insulator, means for separating the groups of conductors so as to insulate each conductor group from any other conductor group, a second coaxial insulator, and an outer armor of conductive material separated from said groups of conductors by said second coaxial insulator; the logging tool also includes means connected to the sensing means and to the transmission system for applying the high frequency signal to the inner conductor and to the groups of conductors of the cable and for applying the low frequency signal to one conductor group and to the outer armor of conductive material; and surface electronics adjacent to the borehole for processing the signals transmitted by the transmission system to provide outputs corresponding to the sensed condition.

4,028,661

PAGER SUBSYSTEMS

Thomas J. Mortimer, Amherst, N.H., assignor to Sanders Associates, Inc., Nashua, N.H.

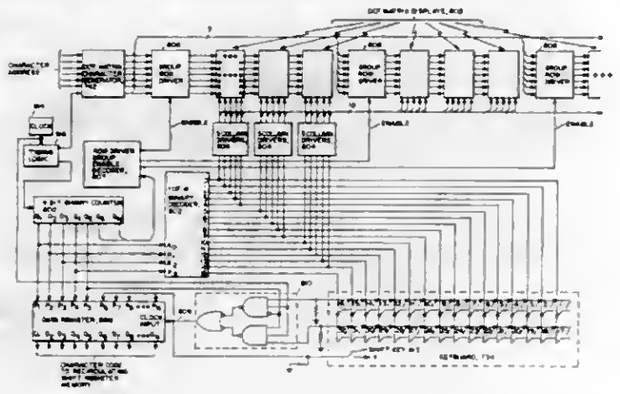
Filed May 22, 1975, Ser. No. 580,092

Int. Cl.² G06F *3/14*

U.S. Cl. 340—324 M **6 Claims**

1. An alpha numeric message encoder including a message

entry keyboard, a memory for storing the message entered from the keyboard, means having columns and rows, the columns of which are sequentially activated by strobing signals for displaying the message stored in the memory, and a



single logic circuit both for decoding the message entered at the keyboard prior to storage in said memory by providing a sequence of strobing signals for reading out the keyboard and for providing the same strobing signals for strobing said display means.

4,028,662

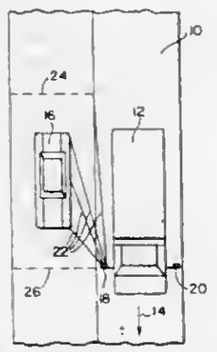
PASSING VEHICLE SIGNALLING APPARATUS

Raymond Donald Young, High St., Meredith, N.H. 03253

Filed May 24, 1976, Ser. No. 689,496

Int. Cl.² G08G *1/00*; G01S *9/66*

U.S. Cl. 340—32 **6 Claims**



1. A passing vehicle signalling apparatus comprising at least one rearwardly directed range detecting apparatus affixed outwardly and along one side of a first vehicle, said range detecting apparatus for detecting the presence of a second vehicle adjacent to and disposed rearwardly a maximum distance from said range detecting apparatus when said second vehicle is disposed outwardly from said one side of said first vehicle, maximum distance adjustment means for manufally adjusting said maximum distance, alarm means for signalling the presence of said second vehicle within said maximum distance, switch means for selectively operating said range detecting apparatus, timing means for permitting said range detecting apparatus to remain operative for a pre-set maximum period of time, said pre-set maximum period of time being capable of being foreshortened when said switch means being manipulated to de-energize said range detecting apparatus.

4,028,663

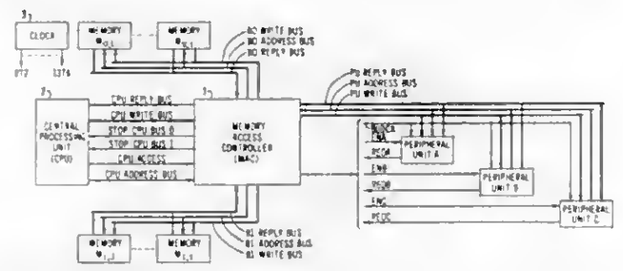
DIGITAL COMPUTER ARRANGEMENT FOR HIGH SPEED MEMORY ACCESS

Robert Dale Royer, Naperville, and Thomas Frank Schwab, Lisle, both of Ill., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed June 5, 1974, Ser. No. 476,435

Int. Cl.² G06F *13/00*

U.S. Cl. 340—172.5 **15 Claims**



1. A data processing system having a central processor, a plurality of peripheral units arranged in a preassigned priority, a plurality of memories accessible on request by said processor and said units and a memory access controller cooperating with said processor and said units to process conflicting access request for said memories , each one of said units comprising:

timing means startable for generating a first, a second, a third, and a fourth timing signal, each timing signal being generated at a predetermined interval after the start of said timing means;

means responsive to said first timing signal for forwarding to said controller an address designating one of said memories;

means responsive to said second timing signal for sending data from said one unit to said controller; and

means for repetitively generating access requests for said memories, said generating means being responsive to said third timing signal for stopping generation of said access requests;

said memory access controller comprising: a first priority circuit responsive to a first set of access requests generated by said units for starting the timing means in a first unit with the highest priority request in said first set, said set including a single request generated by each unit desiring to access said memories; and

means responsive to an address received from said first unit and to an address received from said processor for sending a blocking signal to stop the timing means in said first unit after said second timing signal is generated and before said third timing signal is generated when said processor and said first unit are requesting simultaneous access to the same memory.

4,028,664

APPARATUS FOR DISPATCHING DATA OF THE HIGHEST PRIORITY PROCESS HAVING THE HIGHEST PRIORITY CHANNEL TO A PROCESSOR

Earnest M. Monahan, Phoenix, and Garvin W. Patterson, Glendale, both of Ariz., assignors to Honeywell Information Systems, Inc., Waltham, Mass.

Filed Mar. 26, 1975, Ser. No. 562,314

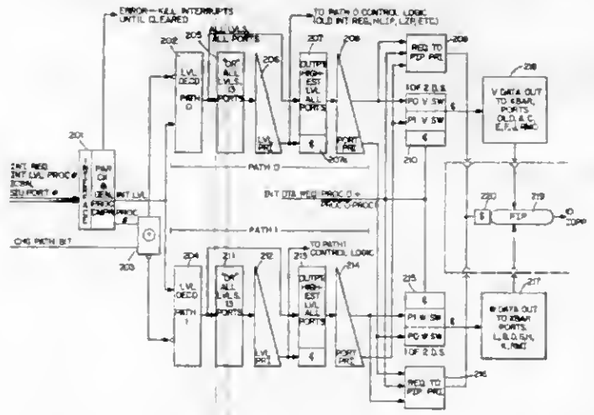
Int. Cl.² G06F *9/18*

U.S. Cl. 340—172.5 **9 Claims**

I. In a data processing system having a system interface unit (SIU), a plurality of peripheral units, a plurality of processors and at least one processor of said plurality of processors executing a first one of a plurality of processes having a first level of priority each of said processes having a priority level based on the relative importance of said plurality of processes, and with any of said processes generating signals for requesting

control of said one processor, said data processing system further including at least one peripheral channel for each one of said peripheral units, each peripheral channel selectivity coupled to said SIU for communication between any one of said peripheral units and said one processor, each peripheral channel having a priority level based on the relative importance of the peripheral unit associated with its peripheral channel, and with any of said peripheral channels also generating signals for requesting assignment to said one processor, a dispatcher mechanism in said SIU for dispatching data to said one processor by any one of said requesting processes based on priority of said peripheral channel of said requesting process and the priority of said requesting process, said dispatcher mechanism comprising:

a. a plurality of processor communication channels, one each of said plurality of processors coupled to said SIU via one each of said processor communication channels for communication between said any one of said plurality of processors and any one of said plurality of peripheral units;



b. first means responsive to a request signal indicative that a second process of said plurality of processes has requested control of said one processor, said first means for selecting one of a plurality of said processor communication channels;

c. second means in each of said processor communication channels for determining the highest priority peripheral channel of the highest priority second process of said group of processes generating signals requesting control of said one processor;

d. third means, coupled to said second means and to said one processor, for determining the higher priority level between said first one of said plurality of processes and said highest priority peripheral channel of the highest priority second process;

e. fourth means, coupled to said plurality of processor communication channels and to said third means, for receiving data required to effect the transfer of control from said first one of said processes to said second process; and

f. fifth means, coupled to said fourth means, for dispatching the data from the highest priority peripheral channel of the highest priority second process to said one processor.

4,028,665

INFORMATION STORE SYSTEM COMPRISING A PLURALITY OF DIFFERENT SHIFT-REGISTERS

Joseph Nageeb Tasso, 18 rue de la Glaciere, 75013 Paris, France

Filed June 3, 1975, Ser. No. 583,402

Claims priority, application France, June 7, 1974, 74.19818

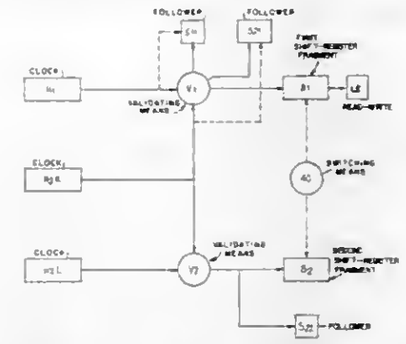
Int. Cl.² G06F *13/02*

U.S. Cl. 340—172.5 **11 Claims**

1. For a program controlled information processing system operating on multi-data blocks, a large capacity store comprising:

a plurality of addressable memory sections, each having simultaneously controllable bit shift-registers equal in number to the number of bits in a data block to constitute a data-block shift-register of addressable block line positions and being individually controllable for a step by step operation;

each said data block shift-register in a memory section being comprised of elementary block shift-registers or fragments having different characteristics, those fragments being selectively serially connectable or adapted to be looped;



read-write means associated with at least one of said fragments;

closing means associated with said at least one fragment in order to form a closed loop;

switching and synchronizing means provided in order to form an overall closed loop with said at least one fragment and the other ones.

4,028,666

DATA TRANSFER SYSTEM

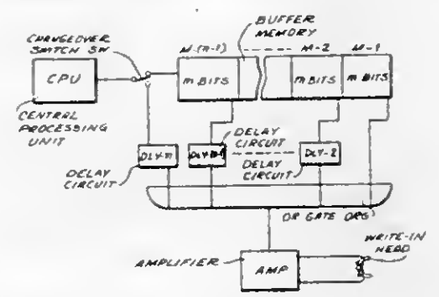
Masao Suzuki, Yokohama, and Kunitoshi Moriya, Kawasaki, both of Japan, assignors to Fujitsu Ltd., Kawasaki, Japan

Filed Oct. 29, 1975, Ser. No. 626,642

Claims priority, application Japan, Oct. 31, 1974, 49-126133

Int. Cl.² G06F *7/00*

U.S. Cl. 340—172.5 **8 Claims**



1. A data transfer system for receiving incoming digital data serially at a predetermined bit rate and transferring said data serially at a different bit rate, said data transfer system comprising

distributing means for distributing the bits of incoming data into a plurality of groups;

delay means connected to the distributing means for delaying the bits of each group by predetermined delay times;

assembly means connected to the distributing means and the delay means for assembling the delayed bits of each group into a group having a bit rate different from that of the incoming data; and

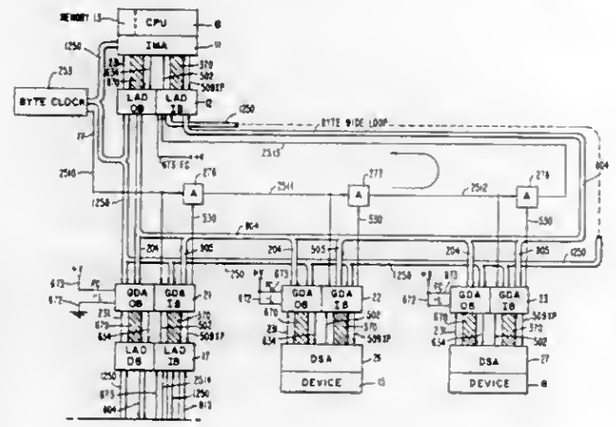
an output coupled to the assembly means.

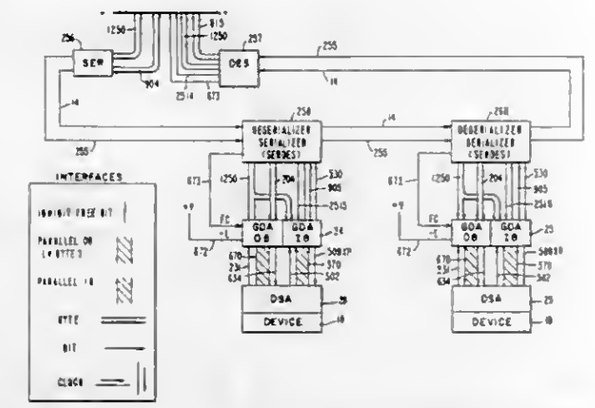
4,028,667

ASYNCHRONOUS, HIERARCHICAL LOOP COMMUNICATION SYSTEM WITH INDEPENDENT LOCAL STATION CONTROL OF ACCESS TO INBOUND TIME PORTIONS WITHOUT CENTRAL CONTROL

Franklin Charles Bresiau, Teaneck, N.J., and Gerald Goertzel, White Plains, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 22, 1975, Ser. No. 643,711
Int. Cl.² H04J *3/08;* **G06F** *3/04*
U.S. Cl. 340—172.5 **13 Claims**





1. A loop data communication system including a loop comprising a transmission medium having an input end and an output end, a central loop terminal interface connected to send data into said input end and to receive data from said output end of said loop,

a message frame generator for generating time division multiplex frame timing and synchronization control signals for devices connected to said loop,

an indirect memory access channel for connecting said central loop terminal interface to data processing hardware adapted to provide data demanded therefrom,

said frame control signals providing synchronization for inbound time and outbound time portions in each frame, for signals inbound to said central interface and outbound from said central interface,

a plurality of interface stations adapted for coupling data processing equipment to said loop for message communication with said access channel, said stations being connected to said loop,

said message frame generator always generating with each frame a free frame signal designating a free inbound time portion without addressing said signal to any specific interface station indicating the availability of said frame for an interface station on a first come, first serve basis,

means adapted for coupling said free frame signal to each of said interface stations in series upon said loop on a one-at-a-time sequential basis,

seizure means associated with each of said interface stations responsive to a free frame signal for seizing a free inbound time portion appearing at any one of said interface stations without first sending a signal to said central interface effective to assign the corresponding inbound time portion of a frame to said interface station associated therewith in response to a free frame signal and to activate said station to send a message on said free inbound time portion to said central interface and to block communication of said free frame signal by said means adapted for coupling to an interface station downstream from said station having seized said frame, and

said central interface having no control over the allocation of access to send messages on said free inbound time portions of frames by said interface stations, but said control over allocation being maintained exclusively by each of said seizure means independently of said central interface or any other interface station and equipment related thereto on a first come, first serve basis.

4,028,668

APPARATUS FOR SELECTIVELY ADDRESSING SECTIONS AND LOCATIONS IN A DEVICE CONTROLLER'S MEMORY

Douglas L. Rilkonen, Westford, Mass., assignor to Honeywell Information Systems, Inc., Waltham, Mass.

Filed Dec. 22, 1975, Ser. No. 643,730
Int. Cl.² G06F *3/04, 13/00*
U.S. Cl. 340—172.5 **15 Claims**

1. In a data processing system comprising a data processing unit, a controller unit for interfacing a plurality of peripheral devices with an electrical bus, only one of which may be active at any given time, and said electrical bus for transferring information between said units; said controller unit including;

A. apparatus for enabling the control and operation of said device, only one of said devices being controlled by said controller unit at any given time, the one of said devices being controlled hereinafter referred to as the active device;

B. means, responsive to said apparatus for enabling, for storing information relating to the control, operation and status of said devices, said means for storing including a plurality of sections equal in number to the potential number of said devices, each of said sections having a unique section address, and each of said sections including a plurality of locations for storing its associated device's information relating to the control, operation and status thereof, each of said sections having the same topology of said information in the respective locations thereof;

C. means for indicating the identity of said active device;

D. first means, responsive to said apparatus for enabling, for computing the address of one of said locations, said first means for computing also including further means for computing the address of one of said sections independent of the identity of the active device so that a said device which is not said active device may have the contents of its corresponding said section updated;

E. means, responsive to the indication of the identity of said active device, for generating the address of the one of said sections corresponding to said active device;

F. means for addressing said locations with the address computed by said first means for computing;

G. means for generating a select signal if a said device, which is not said active device, is to have the contents of its corresponding said section updated; and

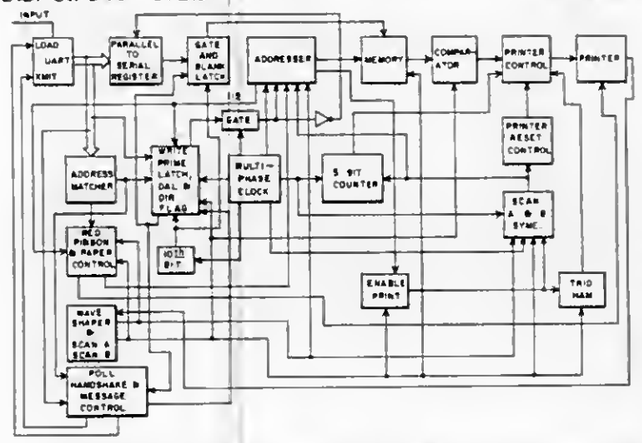
H. means for selecting either said section address computed by said further means for computing if said select signal is generated or said section address generated by said means for generating if said select signal is not generated, for addressing one of said sections.

4,028,669

PRINTER CONTROL SYSTEM

Carlos S. Higashide, Elk Grove Village, Ill., assignor to Honeywell Inc., Minneapolis, Minn.

Filed Jan. 19, 1976, Ser. No. 650,230
Int. Cl.² G06F *3/12*
U.S. Cl. 340—172.5 **28 Claims**



1. A printer control system for a rotary drum printer for printing data, said data comprising bits divided into characters to be printed, said rotary drum printer having a plurality of columns of characters distributed in rows therealong for printing said characters of data and having hammers associated with each column being controlled by said system, said system comprising:

storage means for receiving and storing said data;

drum trace means for providing a drum trace signal dependent upon a position of said drum;

comparator means connected to both said storage means and said drum trace means for comparing said data, a character at a time, to said drum trace signal and for providing a match signal when there is a match of said data character and said drum position and a non-match signal where there is no match;

serial shift register means for shifting and storing match and non-match signals, including a serial shift register and means for supplying to said shift register a column finish signal before a comparison operation is started and for supplying said column finish signal out of said serial shift register when said serial shift register is full of match and non-match signals and means responsive to said column finish signal for terminating said comparison operation; and,

trigger means responsive to said match signals stored in said serial shift register for firing only those hammers corresponding to said match signals after all characters, stored in said storage means, have been compared with said drum position.

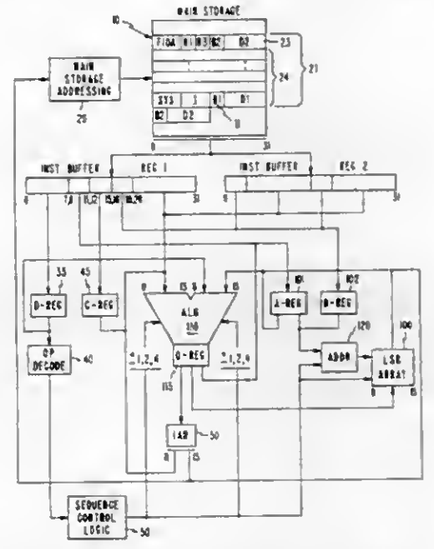
FETCH INSTRUCTION FOR OPERAND ADDRESS CALCULATION

Roy Louis Hoffman, Pine Island; William George Kempke, and Frank Gerald Soltis, both of Rochester, all of Minn., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Feb. 6, 1976, Ser. No. 655,646
Int. Cl.² G06F *9/06*
U.S. Cl. 340—172.5 **6 Claims**



1. In a computer system having storage for storing executable and non-directly executable instructions and operands, said directly executable instructions including for every non-directly executable instruction a predetermined directly executable instruction having bit fields for performing instruction fetch phase and operand address calculation for an associated non-directly executable instruction, and a central processing unit for fetching and executing instructions from storage, the improvement comprising:

identifying means within said central processing unit for identifying non-directly executable instructions fetched from storage,

means responsive to said identifying means indentifying a non-directly executable instruction for retrieving from storage an associated predetermined directly executable instruction having bit fields for performing instruction fetch phase and operand address calculation of said identified non-directly executable instruction, and

means responsive to bits in said bit fields of said fetched predetermined directly executable instruction to re-fetch said identified non-directly executable instruction, to compute operand addresses for operands in said non-directly executable instruction as specified in said predetermined directly executable instruction and to store said computed operand addresses to facilitate retrieval of said operands.

CHARGE COUPLED STORAGE DEVICE MULTIPLEXER

George S. Leach, Jr., Phoenix, Ariz., assignor to Motorola, Inc., Chicago, Ill.

Filed Oct. 6, 1975, Ser. No. 620,089
Int. Cl.² G11C *11/40*
U.S. Cl. 340—173 R **8 Claims**

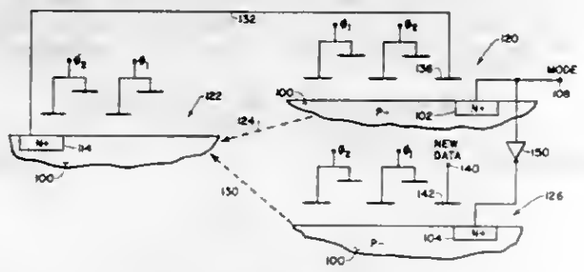
1. A charge coupled device memory having a plurality of charge coupled device stages comprising:

a. a semiconductor substrate,

b. a first and second separated region of a first conductivity type disposed in said substrate each forming respectively a portion of a pair of input stages,

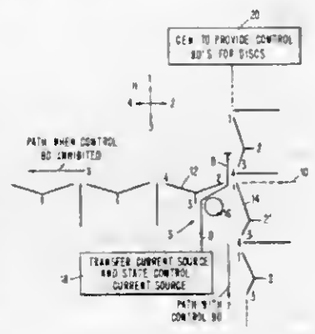
c. a third region of first conductivity type disposed in said

substrate forming a portion of another stage, and said another stage being coupled to both input stages through a plurality of other charge coupled device stages, and



d. enabling means coupled to said first and second regions for selectively recirculating data in a recirculating mode or for entering new data into a write mode of the memory.

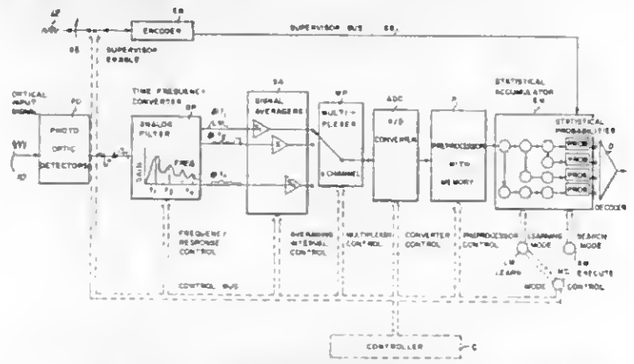
4,028,672
REWRITABLE BUBBLE DOMAIN DECODER
Hsu Chang, Yorktown Heights, N.Y., assignor to International Business Machines Corporation, Armonk, N.Y.
Continuation of Ser. No. 429,411, Dec. 28, 1973, abandoned. This application Mar. 24, 1976, Ser. No. 669,778
Int. Cl.² G11C *11/14*
U.S. Cl. 340—174 TF **14 Claims**



1. A rewritable bubble domain decoder for moving magnetic bubble domains in selected propagation paths in a magnetic medium, comprising:
propagation means defining a plurality of said propagation paths for said bubble domains,
rewritable switch means located adjacent to said propagation means for determining the path of said bubble domains in said magnetic medium, said switch exhibiting two stable states each of which is characterized by a different preferred propagation path,
control means for changing the state of said switch and further means for overriding one of said preferred paths when said switch is maintained in the state corresponding to said one preferred path.

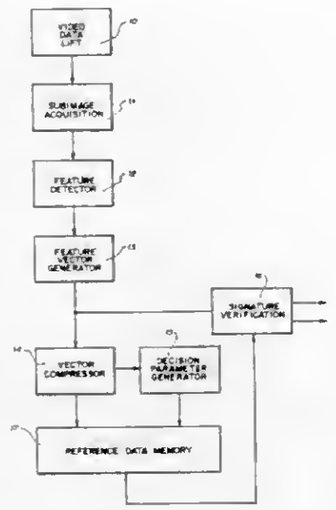
4,028,673
CROSSWIND MEASUREMENTS THROUGH PATTERN RECOGNITION TECHNIQUES
Fredrick J. Taylor, Cincinnati, Ohio; Jack Smith, and Thomas H. Pries, both of El Paso, Tex., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.
Filed Oct. 31, 1975, Ser. No. 627,631
Int. Cl.² G06K *9/00*
U.S. Cl. 340—146.3 R **5 Claims**

1. A pattern recognition method for measuring crosswind parameters comprising the steps of:
a. generating a spectral profile signal of an optical radiation beam passing through a plurality of crosswinds having known parameters;
b. dividing said spectral profile signals for each known crosswind into selected frequency components;
c. averaging said frequency components over a selected period of time;
d. digitizing said selected and averaged frequency components;
e. classifying the digitized frequency components in accordance with crosswind parameters of interest;



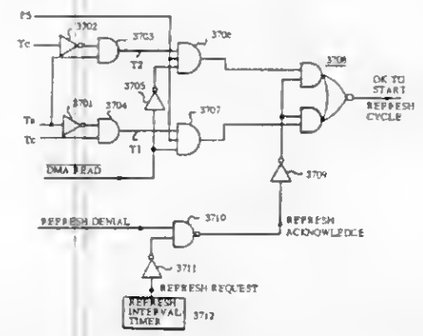
f. storing said classified frequency components as digital retrievable data in a memory;
g. generating a test spectral profile signal of said optical beam passing through crosswind of unknown parameters;
h. performing steps (b) to (f) on said test signal; and
i. matching the test signal parameter data with the closest known parameter data to determine a best estimate of the parameters of the unknown crosswind.

4,028,674
AUTOMATED SIGNATURE VERIFICATION SYSTEM
Ping-Chien Chuang, Irving, Tex., assignor to Recognition Equipment Incorporated, Dallas, Tex.
Filed June 4, 1976, Ser. No. 692,768
Int. Cl.² G06K *9/00*
U.S. Cl. 340—146.3 SY **16 Claims**



1. A method of identifying an authorized signature, which comprises:
a. optically electrical images representative of multiple authorized signatures;
b. scanning said electrical images to locate signature peaks in said authorized signatures;
c. forming feature sets representative of said authorized signatures;
d. forming from said feature sets a composite feature set;
e. assigning weights to said composite feature set;
f. forming a decision threshold from said weights and said composite feature set;
g. collecting said decision threshold, said weights and said composite feature set to form a reference data set;
h. repeating steps (a) through (c) for an unauthenticated signature; and
i. comparing said reference data set with feature sets of said unauthenticated signature.

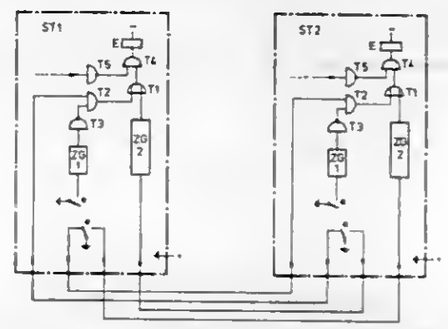
4,028,675
METHOD AND APPARATUS FOR REFRESHING SEMICONDUCTOR MEMORIES IN MULTI-PORT AND MULTI-MODULE MEMORY SYSTEM
Robert J. Frankenberg, San Jose, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif.
Filed May 14, 1973, Ser. No. 360,286
Int. Cl.² G06F *9/18;* **G11C** *7/00*
U.S. Cl. 340—172.5 **9 Claims**



1. Method of operating a module of memory circuits with at least two data processors which may be selectively gated thereto through separate signal ports of the module, said memory circuits requiring periodic refreshing of stored logic manifestations in accordance with a sequence of refresh clock signals applied thereto, the method comprising the steps of:
providing sequences of refresh clock signals for each signal port of the module;
selectively gating a sequence of refresh clock signals present at one signal port of the module to the memory circuits for producing a refresh operation thereof; and
preserving an indication of the occurrences of the refresh operations performed on the memory circuits of the module independently of the signal port thereof through which the sequence of refresh clock signals for each such refresh operation is selectively gated for preserving an indication of the status of memory refresh operations as the signal ports are selectively gated.

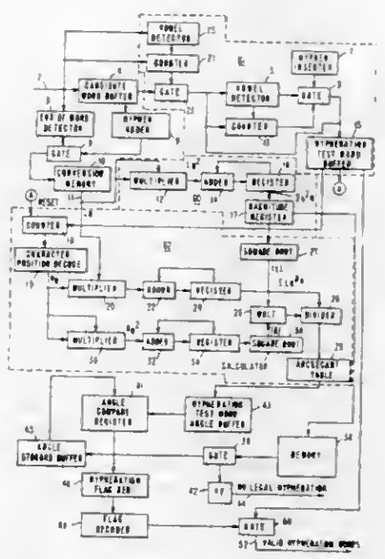
4,028,676
CONTROL OF PERIPHERAL APPARATUS IN TELECOMMUNICATION
Gerhard Wolfer, Oberengstringen, Switzerland, assignor to Siemens-Albis Aktiengesellschaft, Zurich, Switzerland
Continuation of Ser. No. 603,486, Aug. 11, 1975, abandoned. This application Apr. 8, 1976, Ser. No. 675,091
Claims priority, application Switzerland, Aug. 22, 1974, 011480/74
Int. Cl.² H04Q *9/00;* **H01M** *3/00*
U.S. Cl. 340—147 SC **23 Claims**

1. In a method of controlling peripheral units (P1–P20) in a telecommunication system by means of two or more like control apparatus (ST1, ST2, ST3), wherein the peripheral units (P1–P20) are assembled in groups (P1–P5, P6–P10, P11–P15, P16–P20) each of which is associated with its own switching means (S1, S2, S3 or S4) for selectively connecting the particular group (P1–P5, P6–P10, P11–P15 or P16–P20) to a control apparatus (ST1, ST2 or ST3), the improvement comprising in combination the steps of:
effecting the control of all peripheral units (P1–P20) to be controlled at a given time with only one of said like control apparatus (ST1, ST2 or ST3) at that time;
causing each active control apparatus (ST1, ST2 or ST3) to time itself for a first predetermined time as to the duration of its control of said peripheral units (P1–P20), and to initiate a timing cycle in another one of said control apparatus (ST2, ST3 or ST1) for a second predetermined time longer than said first predetermined time;



periodically exchanging the control apparatus (ST1, ST2, ST3) in their control function in response to said self-timing; and
causing in response to a malfunction during the performance of said control function by a particular control apparatus (ST1, ST2 or ST3) the other control apparatus (ST2, ST3 or ST1) in which said timing cycle has then been initiated, to take over the control of said peripheral units (P1–P20) from said particular control apparatus (ST1, ST2 or ST3).

4,028,677
DIGITAL REFERENCE HYPHENATION MATRIX APPARATUS FOR AUTOMATICALLY FORMING HYPHENATED WORDS
Walter Steven Rosenbaum, Silver Spring, Md., assignor to International Business Machines Corporation, Armonk, N.Y.
Filed July 16, 1975, Ser. No. 596,337
Int. Cl.² G06F *5/00;* **G06K** *15/18*
U.S. Cl. 340—172.5 **5 Claims**



1. Apparatus for the automatic hyphenation of alpha words comprising:
buffer means for receiving a word to be hyphenated;
test word generator means connected to said buffer means for forming a set of hyphenated test words from the received word;
conversion means connected to said test word generator

means for converting said set of hyphenated test words into a set of vectors having a common magnitude and a plurality of absolutely unique angles;

memory means containing vector representations for the set of legal hyphenations for a predetermined dictionary of words;

comparison means connected to said conversion means and said memory means for comparing the vector representations for the set of hyphenated test words against the contents of said memory means; and

selection means for selecting the hyphenated test words that compare equal to the contents of said memory means.

4,028,678

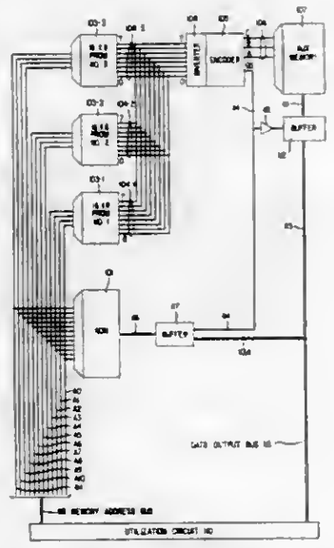
MEMORY PATCHING CIRCUIT

John Christian Moran, Broomfield, Colo., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Oct. 16, 1975, Ser. No. 623,133

Int. Cl.² G06F *13/00*

U.S. Cl. 340—172.5 **10 Claims**



1. A circuit for patching defective word locations of an unalterable memory (ROM) contaning invalid information with said circuit being responsive to the receipt of ROM address words specifying said defective locations, said circuit comprising; a plurality of alterable memories (PROMs) having input conductors each of which receives the bit for a different bit order of said address words, means for applying the bit in each bit order of each of said address words to a unique input conductor of a unique one of said PROMs, a plurality of output conductors on each of said PROMs each of which is unique to a different bit order within a PROM, means for connecting in parallel the output conductors representing corresponding bit orders for each of said PROMs, means in said PROMs for uniquely associating each set of said paralleled output conductors with a different one of said ROM address words representing a defective location, said PROMs being jointly responsive to the receipt of each address word specifying a defective ROM location to apply a patch signal to the set of paralleled output conductors uniquely associated with said specified defective location, an auxiliary memory, and means responsive to said patch signal for controlling said auxiliary memory to output valid program information as a substitute for that stored in said specified defective ROM location.

4,028,679

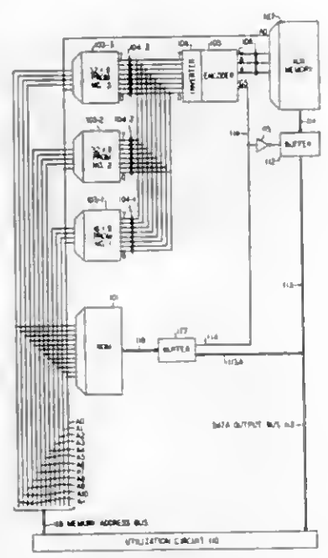
MEMORY PATCHING CIRCUIT WITH INCREASED CAPABILITY

Charles Hamman Divine, Thornton, Colo., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Oct. 16, 1975, Ser. No. 622,938

Int. Cl.² G06F *13/00*

U.S. Cl. 340—172.5 **9 Claims**



1. A circuit for patching defective word locations of an unalterable memory containing invalid information with said circuit being responsive to the receipt of ROM address words specifying said defective locations, said circuit comprising; a plurality of alterable mmemories having address inputs, means for applying n bits of said address words to n different inputs on said PROMs taken collectively, means for applying each one of the remainder of the bits of said address words to a different input of each one of said PROMs, a plurality of output conductors on said PROMs each of which corresponds to a different bit order within a PROM, means for connecting in parallel the output conductors representing corresponding bit orders for each of said PROMs, means in said PROMs for uniquely associating each set of said paralled output conductors with a unique combination of said defective locations with each location being associated with only a single set, said PROMs being responsive to the receipt of an address word specifying a defective ROM location to apply a path signal to the one set of said output conductors associated with said specified location, an auxiliary memory, encoder means responsive to said patch signal for applying encoded address information to said auxiliary memory, and means for applying said remainder of said address bits for said specified location to said auxiliary memory, said auxiliary memory being responsive to the concurrent receipt of said encoded address information and said remainder of said address bits for generating valid program information as a substitute for that stored in said specified defective ROM location.

SYSTEM FOR AUTOMATICALLY PROCESSING AND PRINTING THE CONTENTS AND THE FORMAT OF A TEXT

Vittore Vittorelli, Ivrea (Turin), Italy, assignor to Ing. C. Olivetti & C., S.p.A., Ivrea (Turin), Italy

Continuation of Ser. No. 494,641, Aug. 5, 1974, which is a continuation of Ser. No. 291,145, Sept. 5, 1972, abandoned. This application May 14, 1975, Ser. No. 577,519

Claims priority, application Italy, Sept. 29, 1971, 70186/71; Apr. 19, 1972, 68214/72; July 14, 1972, 69276/72

Int. Cl.² B41J *5/46, 19/00;* **G06F** *9/16*

U.S. Cl. 340—172.5 **12 Claims**

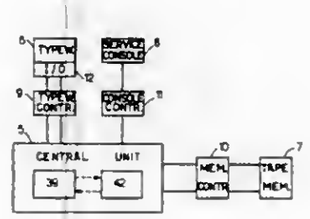
1. A system for automatically processing and printing the contents and the format of a text of lines of characters, the system comprising:

input means for developing character codes corresponding to desired characters to be entered into the system on a line-by-line basis;

printing means receptive of character codes for printing characters in character lines each line having a maximum predetermined length;

storage means receptive of character codes for storing each of the codes associated with entered character lines into one of a plurality of storage blocks and including means for reading out each storage block to apply the character codes therein to the printing means for the printing of same, each block having a capacity for storing the code of one character line of said maximum predetermined length; and

actuatable control means associated with said input means for controlling the operation of said storage means and said printing means to effect the reading of character



codes from the storage blocks and the printing of same by the printing means, said control code of a given storage block with the second service character code of said given storage block and character codes recordable in each block and for developing a first service character code corresponding thereto, means operable with said input means for controlling said storage means to store the first service character code in each of said blocks, means responsive to each character code entered by said input means in each character line for developing a second service character code for each block corresponding to the number of character codes entered in the associated line, first comparison means for comparing the first service character code with said second service character code and print control means responsive to said first comparison means for effecting the printing of said given storage block by said printing means when the first service character code thereof is equal to the second service character code thereof.

4,028,681

SYSTEM FOR AUTOMATICALLY PROCESSING AND PRINTING THE CONTENTS AND THE FORMAT OF A TEXT

Vittore Vittorelli, Ivrea (Turin), Italy, assignor to Ing. C. Olivetti & C., S.p.A., Ivrea (Turin), Italy

Continuation of Ser. No. 494,641, Aug. 5, 1974, which is a continuation of Ser. No. 291,145, Sept. 5, 1972, abandoned. This application May 14, 1975, Ser. No. 577,520

Claims priority, application Italy, Sept. 29, 1971, 70186/71; Apr. 19, 1972, 68214/72; July 14, 1972, 69276/72

Int. Cl.² B41J *5/46, 19/00;* **G06F** *9/16*

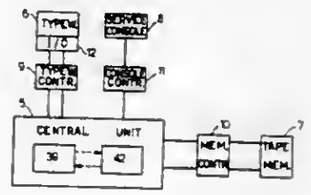
U.S. Cl. 340—172.5 **9 Claims**

1. A system for automatically recording and searching information comprising:

input means for developing character codes corresponding to desired characters to be entered into the system in character lines and including means for developing format label codes and tabulation character codes each corresponding to selected points along each character line;

printing means associated with said input means for printing characters in character lines;

storage means associated with said input means for storing entered information in a recording medium and having means defining a plurality of data storage blocks each having a capacity to store a given number of character codes corresonding to one line of characters and including means for reading out each of the storage blocks for applying data therein to the printing means; and control means associated with said input means for controlling the operation of said storage means and said printing means, said control means comprising means receptive of the tabulation codes and the format label codes from the input means for defining an information format comprising at least two sections of the character line, each section



for one different class of information to be entered by said input means with each class of information corresponding in position in the character line to its associated section and wherein each section has a starting point in the character line corresponding to one tabulation code and has a selectable fixed length corresponding to the length of one format label code, means for effecting storage of the tabulation and label codes in a predetermined storage block and means responsive to the codes to the information format stored in said predetermined storage block for controlling said storage unit to effect the storage of entered information of said two classes of information in the corresponding sections in each of the remaining storage blocks corresponding to the sections of the character line.

CIRCUIT ARRANGEMENT FOR SELECTING THE FUNCTION OF CONNECTION CONTACTS ON CIRCUIT CHIPS

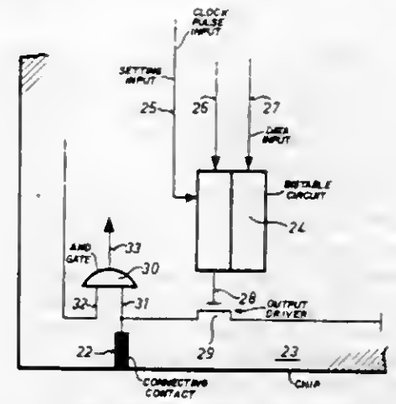
Gerald Weber, and Jurgen Sorgenfrei, both of Braunschweig, Germany, assignors to Olympia Werke AG, Wilhelmshaven, Germany

Filed Dec. 20, 1974, Ser. No. 535,090

Claims priority, application Germany, Dec. 22, 1973, 2364253

Int. Cl.² G06F *3/00, 9/00*

U.S. Cl. 340—172.5 **3 Claims**



1. In a circuit arrangement of at least one highly integrated chip for a microprogrammed data processing device asso-

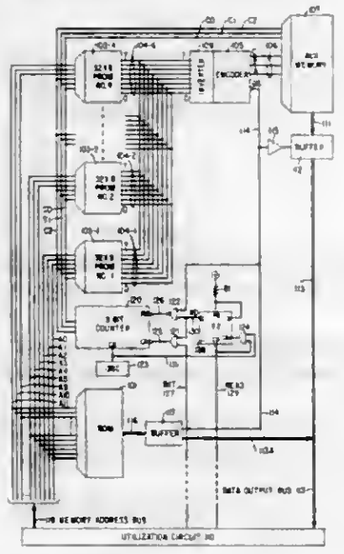
ciated with peripheral units, the chip containing circuit components, the arrangement further including connecting contacts on the chip connecting circuit components thereon to the peripheral units for transfer of signals therebetween, the improvement comprising selecting means connected to said contacts for connecting each said contact to constitute either an input or an output terminal under the control of the microprogram contained in the ROM, said selecting means including, for each said connecting contact: a bistable circuit on the chip on which its respective contact is located and having an output in signal transmitting communication with said connecting contact such that a signal corresponding to the logic state of said bistable circuit is continually applied to said connecting contact, said bistable circuit being connected to be set and reset by the microprogram for maintaining said bistable circuit in a selected logic state when said contact constitutes an input terminal and controlling the logic state of said bistable circuit in accordance with signals produced by at least one circuit component on said chip when said contact constitutes an output terminal; and a gating circuit having a signal input in signal receiving communication with said connecting contact and a gating input connected to be controlled by the microprogram for causing said gating circuit to transmit signals present at its said signal input when said contact constitutes an input terminal and to block transmission of signals present at said signal input when said contact constitutes an output terminal.

4,028,683

MEMORY PATCHING CIRCUIT WITH COUNTER

Charles Hamman Divine, Thornton, and John Francis O'Neill, Boulder, both of Colo., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Oct. 16, 1975, Ser. No. 622,939
Int. Cl.² G06F *13/00*
U.S. Cl. 340—172.5 **14 Claims**



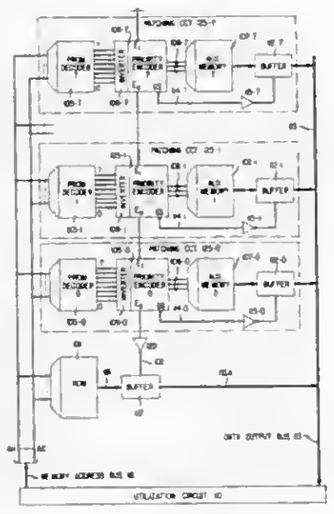
1. A circuit for patching defective locations of an unalterable memory (ROM) containing invalid program information in response to the receipt of ROM address words specifying said defective locations, said circuit comprising; a plurality of alterable memories (PROMs) each having a first and a second group of address inputs, means for applying the bits of said ROM address words to said first group of PROM inputs with each bit being applied to only a single input of said PROMs taken collectively, a plural order counter, means for connecting each order of said counter to a different input of said second group on each one of said PROMs, said connecting means being effective to apply counter output signals representing the current position of said counter to the inputs of said second group, a plurality of output conductors on each of said PROMs each of which corresponds to a different bit order within a PROM, means for connecting in parallel the output conductors representing corresponding bit orders for each of said PROMs, means in said PROMs for associating each set of said paralleled output conductors with a unique combination of said defective locations with each location being associated with only a single set, said PROMs being responsive to the concurrent receipt of an address word specifying a defective ROM location and to said counter output signals to apply a patch signal to the one set of said output conductors associated with said specified location, an auxiliary memory, an encoder responsive to said patch signal for applying encoded address information to said auxiliary memory, and means for applying said counter output signals to said auxiliary memory, said auxiliary memory being responsive to said encoded address information and said counter output signals for generating valid program information as a substitute for that stored in said specified defective ROM location.

4,028,684

MEMORY PATCHING CIRCUIT WITH REPATCHING CAPABILITY

Charles Hamman Divine, Thornton, and John Christian Moran, Broomfield, both of Colo., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Oct. 16, 1975, Ser. No. 622,940
Int. Cl.² G06F *13/00*
U.S. Cl. 340—172.5 **15 Claims**



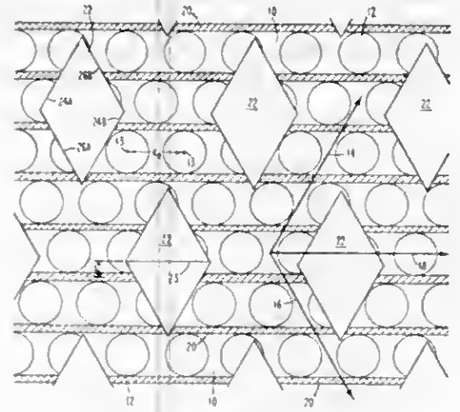
1. A circuit for patching and repatching defective word locations of an unalterable memory (ROM) containing invalid information with said circuit being responsive to the receipt of address words specifying said defective ROM locations, said circuit comprising; an alterable memory (PROM) decoder having inputs for receiving said ROM address words, a plurality of outputs on said decoder, means in said decoder for associating said each one of said defective ROM locations with different ones of said outputs with the address word for at least one of said locations being associated with a plurality of said outputs, said decoder being responsive to the receipt of the address word specifying said one defective ROM location for applying a patch signal to each of said outputs associated with said word for said one location, a priority encoder having inputs arranged in a predetermined order of preference with each input being individually connected to a different one of said decoder outputs, said encoder being responsive to the simultaneous receipt of a patch signal on a plurality of said inputs for encoding only the patch signal on the most preferred one of said inputs that receives a patch signal into address information, an auxiliary memory, and means for applying said encoded address information to said auxiliary memory for generating valid program information as a substitute for that stored in said one defective ROM location.

4,028,685

FIELD ACCESS PROPAGATION OF BUBBLE LATTICE

John Scott Eggenberger, Los Altos, and Otto Voegeli, San Jose, both of Calif., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 15, 1975, Ser. No. 640,510
Int. Cl.² G11C *11/14*
U.S. Cl. 340—174 TF **10 Claims**



1. The combination of a bubble lattice having three principal axes and a rotating field access pattern suitable for the translation of bubbles, said pattern comprising

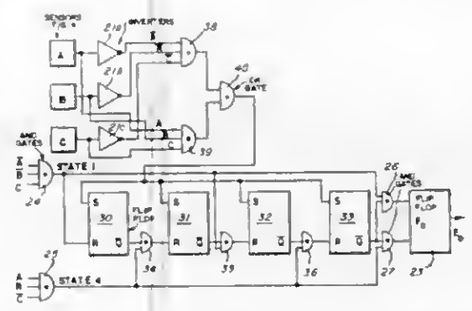
a set of diamond shaped magnetic elements wherein the forces from said elements generated by the application of a rotating in-plane magnetic field will combine with the magnetostatic bubble-bubble interaction forces in the lattice to move the bubbles along a first principal axis of the lattice.

4,028,686

DIGITAL DETECTOR

Michael A. Wilson, and Gordon E. Gee, both of Sarasota, Fla., assignors to Electro Corporation, Sarasota, Fla.

Continuation of Ser. No. 359,463, May 11, 1973. This application May 10, 1976, Ser. No. 684,564
Int. Cl.² G08B *21/00*; G01P *3/48, 3/54*
U.S. Cl. 340—195 **3 Claims**



1. In a speed detector for a rotary member having:

an element with an annular array of alternate slots and teeth of magnetic material,

an odd plurality of magnetic sensor means operably associated with said array of slots and teeth and responsive to relative motion between the array and sensor means,

circuit means to develop alternate digital 1 and 0 outputs from each sensor means, each sensor means being displaced from the other sensor means with respect to the slots and teeth whereby during relative motion the instantaneous outputs of the circuit means have a plurality of sequential states and there is at least one state of the circuit means outputs which does not occur during relative motion but does occur in the absence of such motion,

an AND gate having inputs connected with said circuit means and responsive to one of said plurality of sequential output states to generate a repetitive motion-indicating signal, and

an output circuit actuated by the motion-indicating signal from said AND gate to provide a measure of speed,

an improved inhibiting means for said output circuit, comprising:

an AND gate having inputs connected with the outputs of said circuit means and responsive to said one state of circuit means outputs which does not occur during the motion of the array to generate a fault signal;

means responsive to said fault signal for inhibiting operation of said output circuit; and

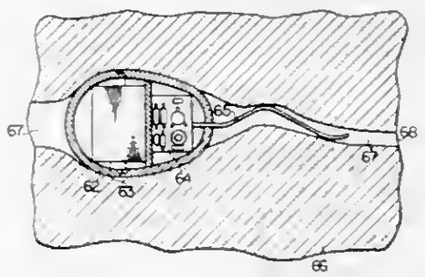
means responsive to repetitive occurrence of one of said plurality of sequential states subsequent to the generation of a fault signal, to enable said output means.

4,028,687

METHOD AND APPARATUS FOR DELIVERY ALARM FOR LIVESTOCK ANIMALS

Sachihiko Hamaguchi; Ikuo Oomura; Tadashi Sato, all of Tokushima, and Hisashi Wada, Takamatsu, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Continuation of Ser. No. 435,245, Jan. 21, 1974, abandoned. This application Sept. 8, 1975, Ser. No. 611,150
Claims priority, application Japan, Feb. 27, 1973, 48-24166; May 17, 1973, 48-55396; May 8, 1973, 48-54391[U]; May 8, 1973, 48-54406[U]; May 15, 1973, 48-57669[U]; May 15, 1973, 48-57670[U]
Int. Cl.² G08B *21/00*
U.S. Cl. 340—201 R **6 Claims**



1. Apparatus for providing an alarm upon the delivery of a livestock animal, comprising

a case for insertion into the birth canal of said livestock animal, said case being pushed out of said birth canal during delivery of a fetus,

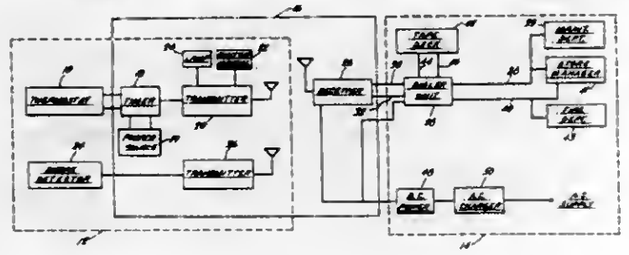
a transmitter including an oscillator located within said case for producing a delivery alarm signal, and

an antenna coupled to said oscillator as a load thereof and extending outside and away from said case and toward the mouth of said birth canal, said oscillator being continuously supplied with electric power and biased such that when the load on said antenna is heavy, the oscillation is substantially stopped near the state where the oscillation is about the start, and when the load on said antenna is relatively high, an oscillation is started; the load on said antenna being heavy when the antenna is within the birth canal, and becoming relatively light causing the antenna to emit a signal from the oscillator when the antenna is pushed out of the birth canal.

4,028,688
REFRIGERATION UNIT AIR TEMPERATURE DETECTION ALARM SYSTEM

Joel B. Goleman, 607 Chelten Hills Drive, Elkins Park, Pa. 19117

Continuation-in-part of Ser. No. 353,340, April 23, 1973. This application Oct. 10, 1975, Ser. No. 621,354
Int. Cl.² G08B *21/00*
U.S. Cl. 340—227.1 **7 Claims**



1. An alarm system for a refrigeration unit whose enclosure contains an energy permeable portion, which may be an opening, comprising

a temperature sensing means within the refrigeration unit including a switch device effectively employing a change of state of contacts, opening or closing, for directly sensing air temperature in the refrigeration unit and producing an indication when air temperature reaches or exceeds a predetermined level,

an integrated circuit timer means containing its own power source independent of a general power source required to operate said refrigeration unit, and directly actuated by the contacts of said temperature sensing means when the air temperature in the refrigeration unit reaches or exceeds the predetermined level and terminated and reset when the temperature drops below the predetermined level,

a communication link means employing energy to which said enclosure portion is permeable responsive to said timer means transmitting an actuating signal to initiate the remote alarm means after the timer means has been actuated continuously for a set predetermined time, and

remote alarm means responsive to said communication linkage means providing a predetermined alarm indicating an abnormal temperature condition in the refrigeration unit.

4,028,689
CALORIMETRIC FLOW MONITOR

Hans Schopp, Altdorf, Germany, assignor to Ellenberger & Poensgen GmbH, Altdorf, Germany

Filed Sept. 18, 1975, Ser. No. 614,596
Claims priority, application Germany, Oct. 5, 1974, 2447617
Int. Cl.² G01F *1/68*; G08B *19/00*
U.S. Cl. 340—239 R **7 Claims**

1. A calorimetric flow monitor for monitoring the flow of a medium through a pipe, comprising, in combination:

a measuring head including

a metallic sleeve having an external thread via which said head can be tightly screwed into a threaded bore of such pipe in a manner such that one end of the said sleeve is directed toward the medium and the longitudinal axis of said sleeve is perpendicular to that of the pipe,

an insulating block tightly closing the one end of said sleeve and protruding from the one end of said sleeve, said block being provided with two through bores extending in the direction of the length of said sleeve,

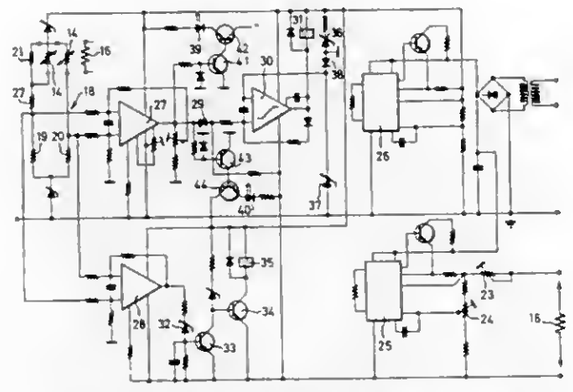
two pins each tightly fitted inot a respective one of said through bores at the end of said block which protrudes from said sleeve, said pins protruding from said block and being of a material having a high thermal conductivity and each said pin being formed to have a blind bore,

first and second tubular, heat conductive sleeves each disposed in a respective one of said blind bores,

first and second thermistors each disposed in a respective one of said blind bores and located within a respective heat conductive sleeve while being insulated therefrom,

a heating coil wound on said first heat conductive sleeve for heating the respective thermistor in said first heat conductive sleeve, and

a casting resin having good heat conductivity filling each of said blind bores for establishing a good thermal communication between each said thermistor and the flow medium when said head is disposed in a pipe through which such medium is flowing, whereby heat



supplied to said first thermistor by said heating coil can be carried off by the medium and said second thermistor can be brought to the temperature of the medium;

means defining an electrical bridge circuit including said thermistors;

first and second differential operational amplifiers each having a pair of inputs connected at selected points of said bridge circuit;

first signal processing means connected to the output of said first differential amplifier for deriving from the output signal therefrom an indication of increases or decreases in the medium flow speed from a predetermined value; and

second signal processing means conducted to the output of said second differential amplifier for deriving from the output signal therefrom an indication of breakages in the connections to said heating coil and said first and second thermistors.

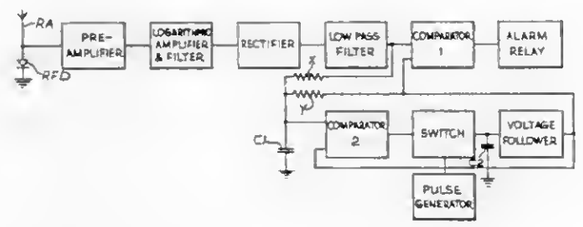
INTRUDER DETECTION DEVICE

Norman Ian Buckley, and Edward Wilson, both of Blackburn, England, assignors to Shorrock Developments Limited, Blackburn, England

Filed Jan. 29, 1976, Ser. No. 653,537
Int. Cl.² G08B *13/24*
U.S. Cl. 340—258 B **5 Claims**

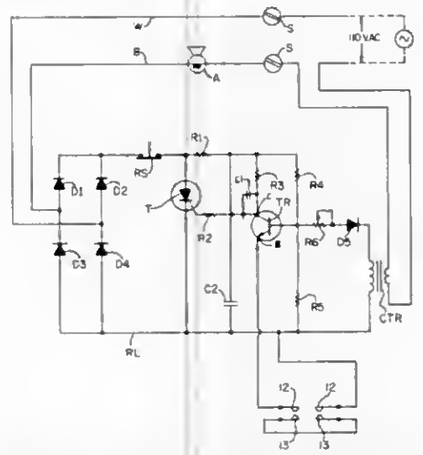


1. A receiver, for an intruder detection system of the kind employing a transmitter to produce a modulated radio frequency emission which is received by a receiver the output level of which is monitored to detect changes in received signal level indicative of the presence of an intruder in the area between the transmitter and the receiver, the receiver comprising: an aerial, a radio frequency detector to demodulate the signal received by the aerial, signal processing means adapted to provide a D.C. signal the level of which is proportional to the amplitude of the demodulated signal, sampling means adapted to sample the level of said D.C. signal at predetermined intervals of time, detector means connected to the signal processing means via the sampling means to detect a change in the D.C. level greater than a predetermined amount during any one of the predetermined intervals and, in the event of detection of such a change, to initiate an alarm, the sampling means including a switch adapted to open and close at predetermined intervals for providing at each side of the switch potentials representative respectively of the D.C. signal and a datum derived from the level of the D.C. signal during a preceding closed interval of the switch.

4,028,691
THEFT DETERRING APPARATUS

Abraham Zeder, c/o Stajer Corp., 8 Winter Green Circle, Andover, Mass. 01810

Filed Apr. 2, 1976, Ser. No. 673,287
Int. Cl.² G08B *21/00*
U.S. Cl. 340—280 **5 Claims**



1. Electrical appliance theft preventing apparatus usable in connection with appliances having a power cord and plug end plugged into an electrical utility power outlet to define a main circuit and comprising,

means defining an auxiliary d.c. circuit with a gated switch whose gating is in a low voltage, low current, portion of the auxiliary circuit and is controlled by an electrical switch thereby with two (cantilevered) spring contact elements both of which are mounted in common at one end,

means interconnecting the power cord plug and springy contacts to establish one state of opening/closing of the electrical switch contacts when the plug is in the outlet and to change the state when the plug is removed,

means defining an alarm device,

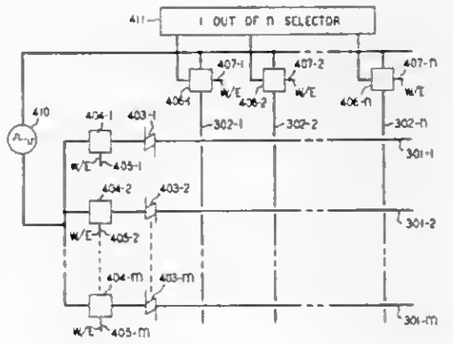
means for activating the alarm device under control of said gated switch in the auxiliary circuit the gating being controlled by said change of state to activate the alarm device,

and means separate from said electrical switch for resetting the circuit and deactivating the alarm device.

4,028,692
LIQUID CRYSTAL DISPLAY DEVICE

Peter Dinh-Tuan Ngo, Colts Neck, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Sept. 15, 1975, Ser. No. 613,220
Int. Cl.² G02F *1/13*; H01J *17/48*
U.S. Cl. 340—324 M **9 Claims**



1. Apparatus comprising

a plurality of capacitive display cells, each comprising first and second conductors and a layer of liquid crystal material and one or more additional layers of dielectric material confined between said conductors,

means for initially storing signals in selected ones of said display cells,

a source for repetitive alternating polarity signals, and

switching means unresponsive to said alternating polarity signals alone but responsive to the sum of said alternating polarity signals with signals of at least a predetermined minimum magnitude stored in said selected display cells for repetitively applying said alternating polarity signals to said selected display cells,

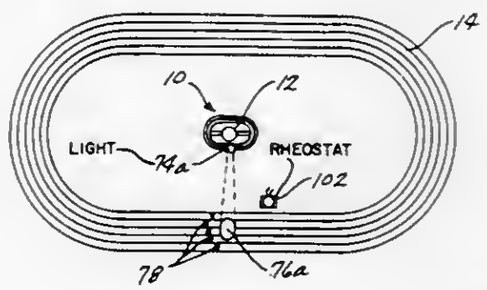
said display cells being disposed in a rectangular matrix, said first conductors comprising a plurality of conductors each common to cells in a plurality of rows of said matrix, and said second conductors comprising a plurality of conductors each common to cells in a plurality of columns of said matrix,

said switching means comprising a plurality of bilateral threshold switches each connected between said source of signals and a respective one of said conductors common to cells in a plurality columns of said matrix, said switching means further comprising means for sequentially connecting each of said conductors common to a plurality of rows of said matrix to said source of signals.

4,028,693
PACE SETTING LIGHT FOR JOGGERS

Ronald W. Kuntz, 4049 56th St., Des Moines, Iowa 50312

Filed Aug. 27, 1975, Ser. No. 608,073
Int. Cl.² G08B *23/00*; A63K *1/00*
U.S. Cl. 340—323 R **3 Claims**



1. A device for projecting a moving spot of light onto a jogging track comprising,

a frame corresponding to the shape of said jogging track,

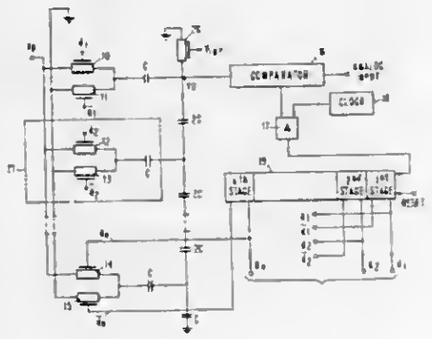
power means mounted to said frame, said power means having a power take-off shaft,
a power gear mounted on said power take-off shaft of said power means,
a first continuous flexible toothed belt meshed with said power gear for constant velocity driven movement thereby,
a driving gear meshed with said power gear,
a second continuous flexible tooth belt meshed with said driven gear for constant velocity movement therewith,
said first and second flexible toothed belts being in parallel spaced apart relationship above said frame, and corresponding to the shape of said frame,
means extending upwardly from said frame to support said first and second flexible toothed belts in said parallel spaced apart relationship,
a light beam source in secured relationship to said first and second toothed belts for constant velocity movement with said belts when said belts are driven, said light beam source being electrically connected to a source of electrical energy.

4,028,694

A/D AND D/A CONVERTER USING C-2C LADDER NETWORK

Peter William Cook, Mount Kisco, and Stanley E. Schuster, Granite Springs, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed June 10, 1975, Ser. No. 585,629
Int. Cl.² H03K *13/02*
U.S. Cl. 340—347 AD **8 Claims**



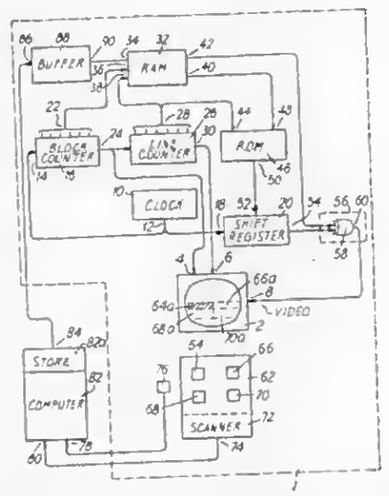
1. An analog-to-digital converter comprising a digital-to-analog converter of the type employing a C-2C switched capacitor ladder network having a plurality of first capacitors having equal first capacitance values, a plurality of second capacitors having equal second capacitance values twice said first capacitance values, said plurality of second capacitors being connected in series between an output terminal of said ladder network and a first reference potential, each of said plurality of first capacitors being connected to respective junctions between each of said plurality of second capacitors, and a plurality of switch means operable to connect respective ones of said plurality of first capacitors to said first reference potential or to a second reference potential, a comparator having first and second input terminals and an output terminal, said first input terminal being connected to the output terminal of said ladder network and said second input terminal being connected to receive an analog signal to be converted, clock means controlled by a signal at the output terminal of said comparator for providing clock pulses, and a counter connected to said clock means for counting said clock pulses, said counter controlling said switched means, the improvement in said switched capacitor ladder network wherein said plurality of first capacitors and said plurality of second capacitors are formed as a monolithic, multi-layer integrated circuit comprising:
a substrate having a plurality of diffused regions formed in one face thereof equal in number to the number of said plurality of first capacitors,
an insulating layer formed over said one face of said substrate and having disposed therein a plurality of conductive layers superposed to said plurality of diffused regions, said conductive layers being separated from said diffused regions by said insulating layer, and
a plurality of metalized regions deposited on said insulating layer and superposed to said plurality of conductive layers, said metalized regions being separated from said conductive layers by said insulating layer,
said plurality of diffused regions, said plurality of conductive layers, and said plurality of metalized regions having graduated areas such that each metalized region lies completely within the area of the corresponding conductive layer and each conductive layer lies completely within the area of the corresponding diffused region, the capacitors formed by said plurality of diffused regions and said conductive layers being said plurality of first capacitors and the capacitors formed by said plurality of conductive layers and said metalized regions being said plurality of second capacitors.

4,028,695

DATA TERMINALS HAVING INTERACTIVE KEYBOARDS AND DISPLAYS AND DATA PROCESSING APPARATUS INCORPORATING SUCH TERMINALS

William George Saich, Camberley, England, assignor to The Solartron Electronic Group Limited, Farnborough, England

Filed July 11, 1974, Ser. No. 487,687
Claims priority, application United Kingdom, July 14, 1973, 33643/73
Int. Cl.² G06F *3/14*
U.S. Cl. 340—365 R **20 Claims**



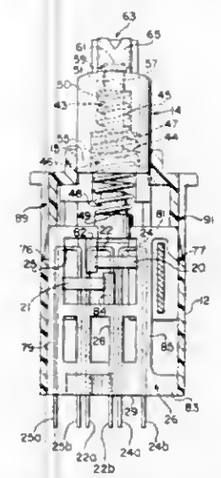
1. A manually-operable data terminal for enabling an operator to communicate with a data processor, the terminal comprising:
a keyboard having a plurality of manually-selectable keys each key including means responsive to such selection to produce a signal representative of a respective message or part of a message to be communicated to the processor;
variable format display means separate from the keyboard having a plurality of zones each corresponding to a respective key of the keyboard, the display means being arranged to display in each zone an indication of the message or part of a message represented by the key corresponding to that zone;
control means responsive to said selection responsive means to change the visual appearance of the display produced by the display means so as to indicate which key is selected; and
means selectably operable by the operator when a desired key has been selected to produce an output signal for communicating the message or part of a message represented by the selected key to the processor.

4,028,696

DOUBLE DEPRESSION MAGNETIC KEYSWITCH

Robert Christen Madland, Mount Prospect; Robert Michael Zielinski, Jr., Schaumberg, and Keith Allen Engstrom, Arlington Heights, all of Ill., assignors to Illinois Tool Works Inc., Chicago, Ill.

Filed Jan. 26, 1976, Ser. No. 652,450
Int. Cl.² G08C *1/00*
U.S. Cl. 340—365 L **12 Claims**



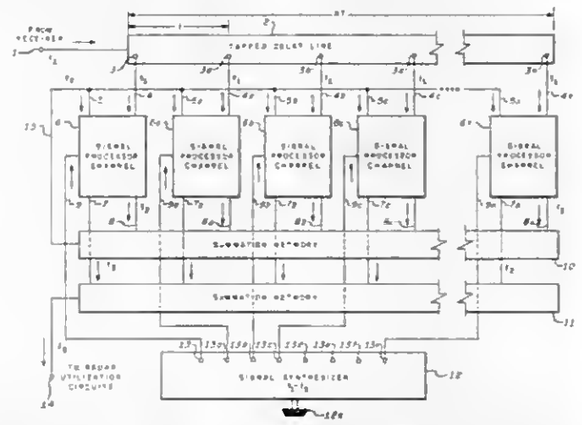
1. A keyboard switch comprising a housing, a depressible actuating member and at least one permanent magnet coupled to said actuating member so as to change the position of said magnet from an unactuated first position to an actuated second position representing a first condition when said actuating member is depressed, and to an actuated third position representing a second condition when said actuating member is further depressed, a unitary support assembly which is removable from said housing comprising first and second toroidal-shaped saturable magnetic cores with said first magnetic core being positioned above second magnetic core, at least one drive wire threaded through both of said cores, at least one sense wire threaded through each of said magnetic cores and a molded electrical insulating support element for supporting said magnetic cores and said drive and sense wires which are molded therein, said drive wires and said sense wires being configurated such that the terminating end of said drive and sense wires which extend out of said housing may be connected to a printed circuit board, a pin which is slideably positionable relative to said actuating member and having a head thereon, first and second spring means for biasing said actuating member to its unactuated position, said first spring means being positioned between said support element and said actuating member and said second spring means being positioned between said head of said pin and said actuating member, both of said magnetic cores being magnetically saturated when said permanent magnet is at its unactuated position, said first magnetic core being magnetically unsaturated and said second magnetic core being magnetically saturated when said permanent magnet is at its second position, at which said first bias spring is compressed and said second bias spring is relatively uncompressed, and said first magnetic core and said second magnetic core both being magnetically unsaturated when said permanent magnet is in its third position, at which both said first and second bias springs are compressed and said head of said pin is restrained against further downward motion by said support element.

4,028,697

ADAPTIVE SIGNAL PROCESSOR FOR CLUTTER ELIMINATION

Angelo P. Albanese, Brooklyn, and David H. Rattiner, Great Neck, both of N.Y., assignors to Sperry Rand Corporation, New York, N.Y.

Filed Sept. 8, 1970, Ser. No. 70,194
Int. Cl.² G01S *9/42*
U.S. Cl. 343—5 R **11 Claims**



8. Apparatus for improving the signal-to-interference characteristic of composite signals comprising desired pulse signals spaced at predetermined intervals, each in the presence of an extended interference signal, said apparatus comprising:
converter means, having plural output means, for placing one each of said desired pulse output means, for placing one each of said desired pulse signals simultaneously on said converter output means,
plural signal processor means each having first, second, and third input means and first and second output means,
means coupling said converter output means to said first input means of said processor means,
first coherent signal summation means having plural input means and output means,
means coupling said first output means of said signal processor means to said plural input means of said first signal summation means,
means coupling said output means of said first summation means to said second input means of said signal processor means,
second coherent signal summation means having plural input means and output means,
means coupling said second output means of said signal processor means to said plural input means of said second summation means, and
means for coupling said output means of said second summation means to utilization apparatus.

4,028,698

DME APPARATUS AND METHOD

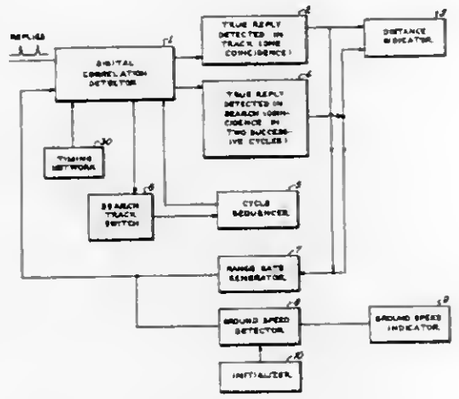
Wayne L. Miller, Stanhope, and Ernest J. Carnicelli, Flanders, both of N.J., assignors to The Cessna Aircraft Company, Wichita, Kans.

Filed Sept. 2, 1975, Ser. No. 609,647
Int. Cl.² G01S *9/56*
U.S. Cl. 343—6.5 LC **26 Claims**

22. A method for determining the distance from a DME transmitter-receiver to a DME station, said transmitter transmitting a jittered interrogation pulse train and said receiver receiving signals from said station which after decoding consist of replies to said transmitted pulses, replies to pulses transmitted by other DME transmitters and squitter, a cycle being the time interval beginning with each interrogation pulse and ending a predetermined duration later during which duration received signals are processed by the apparatus, comprising the steps of

storing information indicative of the times of receipt of all signals received during a first cycle,

determining whether any of said stored times of receipt are identical to the times of receipt of signals received during the cycles following said first cycle for a predetermined number of successive cycles beginning with the second cycle,



providing an information signal or signals indicative of all such times of receipt which are common for said predetermined number of successive cycles, and

deriving a distance measurement signal from the signal indicative of the first occurring of said common times of receipt.

4,028,699

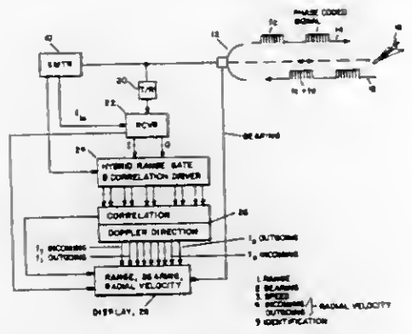
SEARCH RADAR

Robert R. Stevens, Chelmsford, Mass., assignor to Sanders Associates, Inc., Nashua, N.H.

Filed Dec. 13, 1974, Ser. No. 532,344

Int. Cl.² G01S 9/233, 9/44

U.S. Cl. 343—9 **27 Claims**



1. A pulse doppler radar having fine range resolution capability comprising:

means for projecting a pulse of energy including phase coded packets towards a target, the position of each phase coded packet within the pulse correlating to a predetermined range within said pulse,

means for detecting energy returned from said target including phase coded packets reflected by said target and for generating quadrature signals responsive thereto,

means for correlating said quadrature signals with a predetermined range code and a predetermined correlation waveform and for producing output signals responsive to the decoding of both said predetermined code, and said predetermined waveform, and

means responsive to said output signal for producing an indication of the existence of the target at the range corresponding to the number of phase coded packets within a pulse which are decoded by said predetermined range code and the radial velocity of said target.

4,028,700

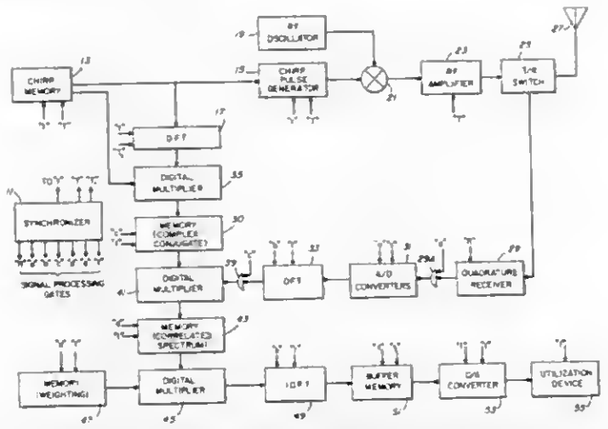
PULSE COMPRESSION RADAR AND METHOD OF OPERATING SUCH A RADAR

David R. Carey, Sudbury; Bertram J. Goldstone, Lexington, and Bernard J. Thompson, Concord, all of Mass., assignors to Raytheon Company, Lexington, Mass.

Filed Nov. 16, 1972, Ser. No. 307,287

Int. Cl.² G01S 7/28

U.S. Cl. 343—17.2 PC **2 Claims**



1. In a pulse compression radar wherein an uncompressed transmitted chirp pulse and a selected uncompressed received chirp pulse are digitally processed in the frequency domain, the method of correlating such chirp pulses comprising the steps of:

a. deriving a first set of complex digital numbers representative of a first frequency spectrum corresponding to the frequency spectrum of the uncompressed transmitted chirp pulse, such spectrum containing amplitude ripples;

b. weighting each one of the complex digital numbers in the first set to derive a corresponding second set of complex digital numbers representative of the complex conjugate of the first spectrum modified to contain amplitude ripples equal and opposite to the amplitude ripples in the first spectrum;

c. storing the second set of complex digital numbers;

d. deriving a third set of complex digital numbers representative of the frequency spectrum of the selected uncompressed received chirp pulse; and,

e. multiplying the second and third set of complex digital numbers to derive a fourth set of complex digital numbers representative of a uniformly weighted frequency spectrum corresponding to a compressed received chirp pulse with range sidelobes.

4,028,701

QUASI-CORNER REFLECTORS FOR ELECTROMAGNETIC RADIATION

Jill J. Parks, P.O. Box 325, and Stephen R. Snook, P.O. Box 846, both of Port Hueneme, Calif. 93041

Filed Apr. 5, 1976, Ser. No. 673,568

Int. Cl.² H01Q 15/20

U.S. Cl. 343—18 C **10 Claims**

1. A plural polyhedrical reflective device for electromagnetic radiation, comprising:

a. a plurality of four-sided pyramidal cavities having reflective surfaces;

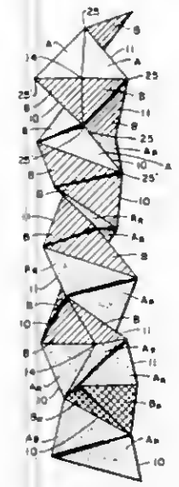
b. the base of each of said four sides being equal in length; the intersection of a plane normal to the vertical axis with the four sides of any one of said pyramidal cavities forming an equal sided parallelogram;

c. the vertex of each pyramidal cavity lying in a first common spiral path;

d. respective base corners of each pyramidal cavity lying in one of respective second and third common spiral paths;

e. said first, second and third spiral paths being symmetrical to each other about a common axis;

f. said plurality of pyramidal cavities being positioned adjacent each other in a side-by-side relationship forming a



long spiral assembly of pyramidal electromagnetic energy reflectors.

4,028,702

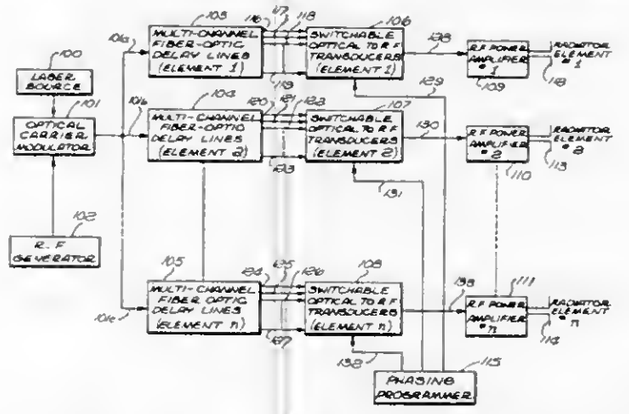
FIBER OPTIC PHASED ARRAY ANTENNA SYSTEM FOR RF TRANSMISSION

Arnold M. Levine, Chatsworth, Calif., assignor to International Telephone and Telegraph Corporation, New York, N.Y.

Filed July 21, 1975, Ser. No. 597,417

Int. Cl.² H01Q 3/26

U.S. Cl. 343—100 SA **9 Claims**



1. In a radar system including a plural element antenna array at least some elements of which are individually phase-controlled for forming a relatively narrow beam directive in at least one plane, the combination associated with at least one of said phase-controlled antenna elements comprising:

first means including a radio frequency generator for producing a signal at the RF frequency of operation of said system;

second means comprising a source providing a light energy output;

third means including a modulator connected for modulating said light energy source with the output of said radio frequency generator;

fourth means responsive to the modulated light output of said third means, including a plurality of optical delay lines driven in parallel from said third means, said optical delay lines each having a physical length for producing a discrete phase delay required to excite a corresponding one of said elements according to a predetermined phasing program;

fifth means operatively associated with said fourth means, for selecting a signal as an output, said selected signal passing through a predetermined one of said optical delay lines to provide a signal having said discrete phase delay; and

sixth means responsive to said fifth means for demodulating said light signals and for providing an RF output signal to said corresponding array element.

4,028,703

APPARATUS FOR RADIO POSITION-FIXING OF THE HYPERBOLIC PHASE-MEASUREMENT TYPE

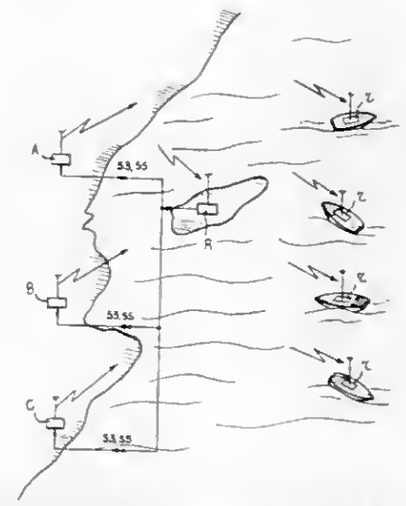
Etienne A. H. Honore, Chatenay-Malabry, and Emile L. G. Torcheux, Paris, both of France, assignors to Societe d'Etude et d'Application des Techniques Nouvelles NEO-TEC, Paris, France

Division of Ser. No. 316,428, Dec. 18, 1972, Pat. No. 3,983,559. This application Mar. 24, 1975, Ser. No. 561,198

Claims priority, application France, Dec. 17, 1971, 71.45492; July 27, 1972, 72.27058; July 27, 1972, 72.27059

Int. Cl.² G01S 1/30

U.S. Cl. 343—105 R **13 Claims**



1. Apparatus for determining the position of a receiver by radio position-fixing comprising:

at least two transmitting stations, each being adapted to radiate

a continuous specific signal of first selected frequency, the frequency of said specific signal radiating from each of said transmitting stations being different from the frequency of said specific signal radiating from all other transmitting stations, and

a sequential signal of second selected frequency, the frequency of said sequential signal being the same at all of said at least two transmitting stations, at most one transmitting station radiating said sequential signal at any time, and

a receiver being adapted to continuously receive at least two of said specific signals and to receive said sequential signal, said receiver including means for decoding said specific signal and said sequential signal to obtain the position of the receiver.

4,028,704

BROADBAND FERRITE TRANSFORMER-FED WHIP ANTENNA

Judd Blass, Herzliah Petuach, Israel, assignor to Beam Systems Israel Ltd., Nof Yam, Israel

Filed Aug. 18, 1975, Ser. No. 605,338

Int. Cl.² H01Q 1/32

U.S. Cl. 343—715 **11 Claims**

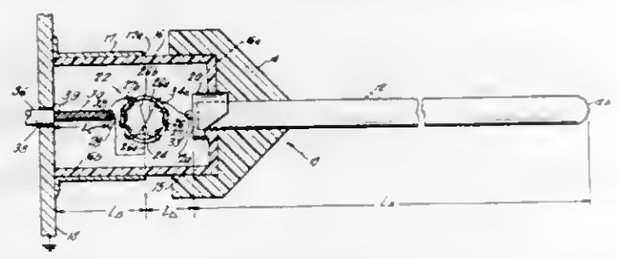
1. A broadband whip antenna having a generally constant impedance across a radio frequency band of greater than 2.5:1, comprising:

a conductive ground plane;

a whip section comprising an elongated cylindrical conduc-

tor of a length approximately equal to 0.185 wavelengths at a lowest frequency in said frequency band and having a length to diameter ratio of the order of 200 or more;

means for positioning said whip section in a plane generally transverse to said ground plane with a first end of said whip section nearest to said ground plane being spaced a predetermined fraction of a wavelength from said ground plane at said lowest frequency to enhance the directivity characteristic of the antenna, said positioning means having a length sufficient to position a second end of said whip section approximately 0.21 wavelengths from said ground plane at said lower frequency;



a coaxial cable having a characteristic impedance between an inner conduetor and an outer conductor thereof across said radio frequeney band; and

broadband transformer means positioned immediately adjacent said whip section first end and having a magnetic core for coupling said coaxial cable inner and outer conductors and said whip section end nearest said ground plane to transform the radiation resistance of said whip section to closely approximate said coaxial cable characteristic impedance, thereby reducing variation of the VSWR of the antenna as measured at the coaxial cable.

4,028,705

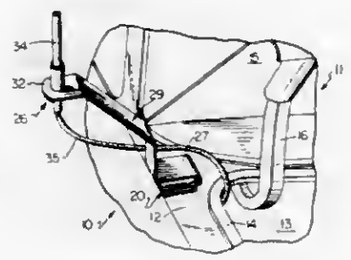
REMOVABLE ANTENNA MOUNT

J. Leslie Loyd, 1524 Elm Ave., S. Pittsburg, Tenn. 37380

Filed Apr. 29, 1976, Ser. No. 681,861

Int. Cl.² H01Q *1/32*

U.S. Cl. 343—715 **3 Claims**



1. An antenna mount for use with a vehicle having a closure member which can be selectively opened and closed, comprising a substantially flat base member, means for mounting said base member on the vehicle in a fixed position underlying a portion of the closure member, said base member having at least one passageway, a body member selectively connected to said base member, said body member having inner, intermediate and outer portions, said inner portion including at least one finger means of a size to be slidably received within the passageway of said base member, said intermediate portion of said body member being elongated and extending outwardly at an angle to said inner portion for positioning adjacent to the vehicle closure member so that the closure member locks said body member to said base member, and said outer portion of said body member having means for receiving a portion of an antenna, whereby said body member is selectively mounted on said base member in a position to support an antenna exteriorly of the vehicle or said body member may be selectively removed from said base member so that no portion of said antenna mount or the antenna is visible when the closure member is closed.

4,028,706

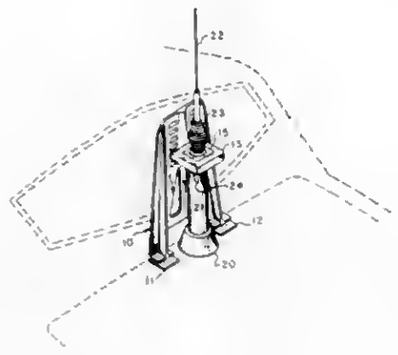
SECURITY LOCK FOR TRUNK MOUNTED ANTENNA

Alvin J. Dolle, 13322 Syracuse, San Antonio, Tex. 78249

Filed Apr. 19, 1976, Ser. No. 678,449

Int. Cl.² H01Q *1/32*

U.S. Cl. 343—715 **6 Claims**



1. A lock and mounting brace for a trunk mounted automobile antenna comprising:

a. a main body having a top portion and a bottom portion,

b. a multiplicity of trunk lid clips constructed in the bottom portion of said main body,

c. an antenna locking arm securing means constructed in the top portion of said main body,

d. an antenna locking arm adapted to securely engage said antenna locking arm securing means, and

e. an antenna locking lug engaged by said antenna locking arm, said antenna locking arm so constructed and arranged as to fit over and engage a radio antenna means.

4,028,707

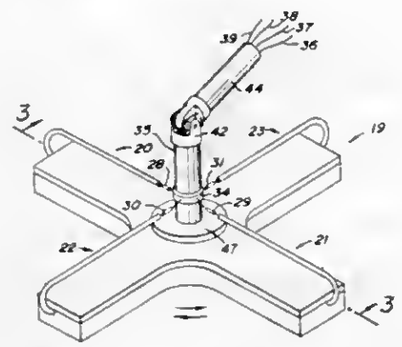
ANTENNA FOR UNDERGROUND PIPE DETECTOR

Jonathan D. Young, Worthington, and Ross Caldecott, Columbus, both of Ohio, assignors to The Ohio State University, Columbus, Ohio

Continuation-in-part of Ser. No. 437,927, Jan. 30, 1974, Pat. No. 3,967,282. This application Mar. 11, 1976, Ser. No. 665,924

Int. Cl.² H01Q *1/04, 21/26*

U.S. Cl. 343—719 **14 Claims**



1. An antenna for transmitting and receiving broad spectrum electromagnetic radiation said antenna comprising a pair of oppositely extending non-resonant, distributively, resistively loaded transmitting arms and a pair of oppositely extending non-resonant, distributively, resistively loaded receiving arms arranged transversely to said transmitting arms, each of said arms comprising an outwardly extending generally

horizontal portion connected at its outer extremity to a return loop portion extending at a higher level than the horizontal portion toward a central common connection and a resistance connecting the interior end of the return loop portion to the said central common connection.

4,028,708

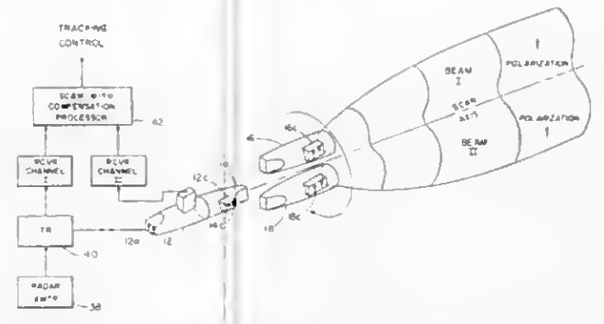
ANTENNA FEED FOR DUAL BEAM CONICAL SCAN TRACKING RADAR

Elmer Donald Woodward, Los Altos, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Oct. 10, 1975, Ser. No. 622,283

Int. Cl.² H01Q *3/10*

U.S. Cl. 343—777 **8 Claims**



1. An antenna feed for a dual beam conical scanning radar comprising:

input means for resolving an input signal into its vertical and horizontal polarization components;

first and second means for outputting first and second output signals that are identically polarized to each other and to said input signal and for receiving return signals;

coupling means for coupling said input means to said first and second means and for separating a return signal received by said first and second means into a first component and a second component in quadrature with said first component, said coupling means comprising a non-reciprocal cross connection between said first and second means, whereby said antenna feed provides for control of the plane of polarization of the transmitted and received signals.

4,028,709

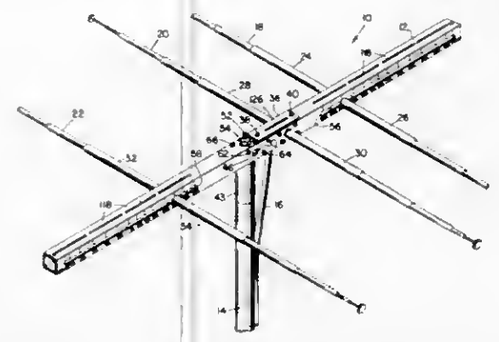
ADJUSTABLE YAGI ANTENNA

Benjamin Berkowitz, Baltimore, Md.; Arthur Luedtke, Marietta, Ga.; William L. Kilpatrick, Austell, Ga., and William F. Bentley, Jr., Smyrna, Ga., assignors to The United States of America as represented by the Field Operations Bureau of the Federal Communications Commission, Washington, D.C.

Filed Sept. 10, 1975, Ser. No. 611,938

Int. Cl.² H01Q *19/30*

U.S. Cl. 343—819 **2 Claims**



1. A yagi antenna comprising a rectangular antenna boom slotted on opposed faces with director and reflector elements coupled to slideable block within said boom through said slots, with half-wave active dipole element affixed to said boom with two insulated blocks on opposed faces and all said director, reflector, and active elements are adjustable in length and the said director and reflector elements are adjustable in spacing with respect to the active element.

4,028,710

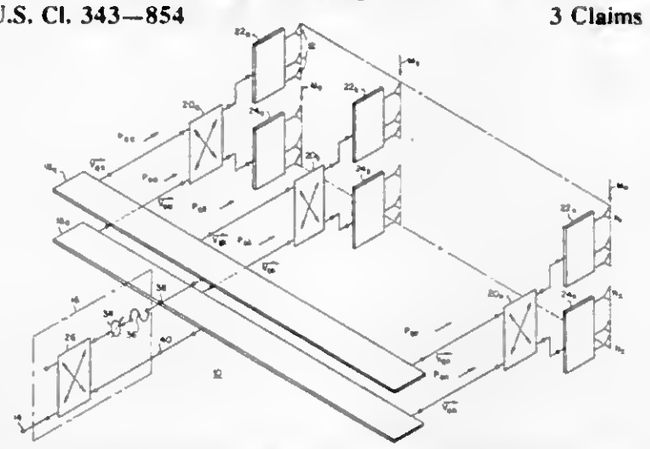
APPARATUS FOR STEERING A RECTANGULAR ARRAY OF ELEMENTS BY AN ANGULAR INCREMENT IN ONE OF THE ORTHOGONAL ARRAY DIRECTIONS

Gary E. Evans, Glen Burnie, Md., assignor to Westingbouse Electric Corporation, Pittsburgh, Pa.

Filed Mar. 3, 1976, Ser. No. 663,340

Int. Cl.² H01Q *3/26*

U.S. Cl. 343—854 **3 Claims**



1. In a directional antenna array of the type having radiating elements aligned in a rectangular arrangement of rows and columns, the directional beam of said array being selectively steerable between limit positions spaced apart by at least one predetermined angular inerement in the column plane, the combination:

a. a plurality of radiating elements arranged in a rectangular array in which the elements are aligned in a set of rows and a set of columns, each column of the set of columns comprising first, second and third subsets of radiating elements, said first and second subsets of each column having like numbers of radiating elements and being disposed with bilateral symmetry to one and the other side of the midpoint of the column, said third set of radiating elements being centrally disposed between the first and second subsets and being centered relative to the midpoint of the column,

b. an array input terminal for receiving r.f. energy,

c. first column-plane beam steering means operative to feed a reference unphased voltage component of said r.f. energy to said third subset of radiating elements and operative to derive from said r.f. energy a selected one of first and second invertible relationships of a doublet of first and second conjugal phase shifted voltage components, and to apply said first and second conjugal voltage components to said first and second subsets, respectively.

4,028,711

METHOD OF AND DEVICE FOR ELECTROSTATIC PRINTING

Gerhard Jost; Ulf Rothgordt, both of Norderstedt, and Klaus Witter, Hamburg, all of Germany, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Apr. 2, 1975, Ser. No. 564,305

Claims priority, application Germany, Apr. 18, 1974, 2418632

Int. Cl.² G03G *13/044, 13/052*

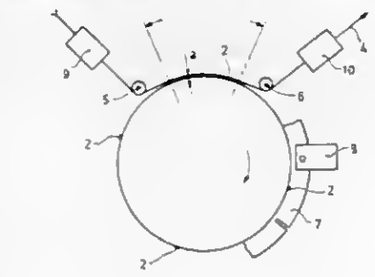
U.S. Cl. 346—153 **10 Claims**

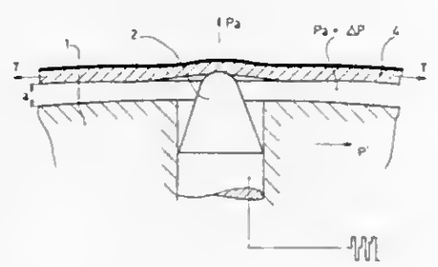
1. A method for electrostatically printing characters which comprises:

providing a record carrier;

providing an electrode which is constructed as a needle having an area of contact dimensioned for forming a predetermined track width on the record carrier;

sliding the electrode against the record carrier under a pressure sufficient to deflect the surface of said record carrier, said sliding step providing no support for the record carrier on the side remote from said electrode and in the immediate region of each of said electrodes;





applying selectively controllable pulses during sliding movement between said electrode and said record carrier;

whereby the area of contact between said record carrier and said electrode determines the width of a recorded track and the charge density applied to said record carrier is linearly dependent on the voltage applied to said electrode.

DISPLAY SYSTEM FOR PHOTOGRAPHIC CAMERA

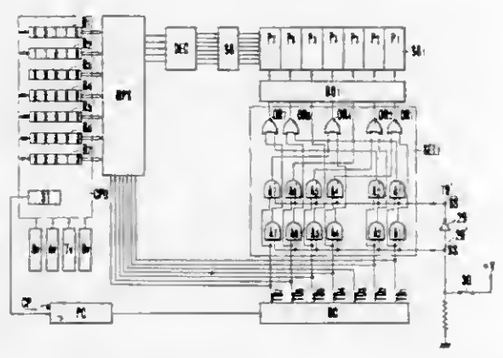
Masaharu Kawamura, Hino; Nobuaki Sakurada, Yokohama; Nobuhiko Shinoda, Tokyo; Tadashi Ito, Yokohama; Fumio Ito, Yokohama, and Hiroyashu Murakami, Tokyo, all of Japan, assignors to Kanon Kabushiki Kaisha, Tokyo, Japan

Filed Nov. 26, 1975, Ser. No. 635,370

Claims priority, application Japan, Nov. 27, 1974, 49-136843; Nov. 27, 1974, 49-136844

Int. Cl.² G03B *17/20*

U.S. Cl. 354—23 D **3 Claims**



1. A display system adapted for use in conjunction with an automatic exposure control system of a camera of the type having a shutter preselection and a diaphragm preselection automatic exposure control modes comprising;

a. a first group of registers for storing the preselected exposure control parameter in binary coded decimal form,

b. a second group of registers for storing the computed result in binary coded decimal form,

c. timing pulse generating means,

d. a multiplexer connected to said first and said second groups of registers and receptive of the timing pulses from said timing pulse generating means for causing the data stored in said first and second groups of registers to be read out in sequence,

e. a decoder for converting the outputs of said multiplexer to corresponding coded signals for display,

f. digital readout means comprises of an array of display elements for displaying digit characters corresonding to the outputs of said decoder,

g. preference signal generating means having shutter preference signal generating means and diaphragm preference signal generating means, and

h. display control means cooperative with said timing pulse generating means for controlling the sequence of operation of said display elements in a selected program; said control means including means for selecting one of two programs in response to occurrence of the signal from said preference signal generating means, whereby the digit characters of the preselected exposure control parameter are displayed in constant positions relative to those in which the digit characters of the computed result are displayed regardless of which mode is rendered operative.

DATA RECORDING CAMERA

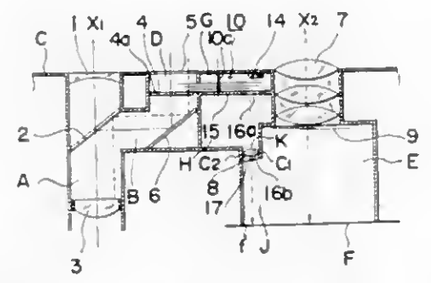
Saichiro Ohashi, Kyoto, and Susumu Fujita, Kobe, both of Japan, assignors to Fuji Photo Film Co., Ltd., Minami-ashigara, Japan

Filed June 2, 1976, Ser. No. 692,073

Claims priority, application Japan, June 3, 1975, 50-67208; June 3, 1975, 50-67209

Int. Cl.² G03B *17/24*

U.S. Cl. 354—106 **5 Claims**



1. In a camera including an exposure system comprising a main focussing lens system and associated main shutter means actuable to effect exposure of film material at an exposure station to image-wise light reflected from a scene to be photographed and a viewfinder system to permit viewing of a scene to be photographed, the improvement comprising:

data specification means including at least one identical item of data;

externally actuable setting means actuable to move said data specification means to different settings in each of which an item of data is brought to a data projection position and a data reflection position;

optical means actuable simultaneously with actuation of said main shutter means to focus the image of a data item located at said data projection position onto a specific portion of said film material located at said exposure station; and

supplementary optical means for always directing the image of a data item located at said data reflection position to said viewfinder system, whereby content of and position relative to said frame of said data item are viewable in said viewfinder system.

4,028,714

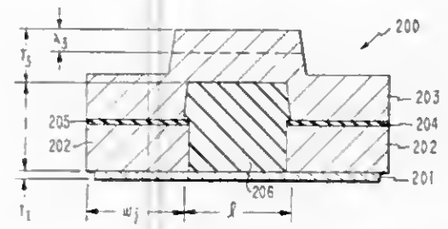
ULTRALOW-POWER, MICRO-MINIATURIZED JOSEPHSON DEVICES HAVING HIGH INDUCTANCE

Walter H. Henkels, Putnam Valley, N.Y., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 31, 1974, Ser. No. 537,802

Int. Cl.² H01L *39/22, 27/18*

U.S. Cl. 357—5 **22 Claims**



1. A superconductive device for operation at a constant temperature below the critical temperature, T_c, of the superconducting materials of said device comprising at least two Josephson tunneling junctions, and means for providing kinetic inductance interconnecting said at least two Josephson tunneling junctions wherein said kinetic inductance is the self-inductance in addition to the normal magnetic inductance when a material is superconducting, said device having an enhancement ratio, L_K/L_∞, of at least one, at least a portion of said means having a thickness less than the London penetration depth, λ, thereof at absolute zero temperature,

where L_K is the difference between the total inductance, L_T, which said device would have at a temperature of absolute zero, and the inductance L_∞ which said device would have at a temperature of absolute zero if the thickness of said at least a portion of said means and the remainder of said means were very large relative to said London penetration depth at absolute zero temperature.

4,028,715

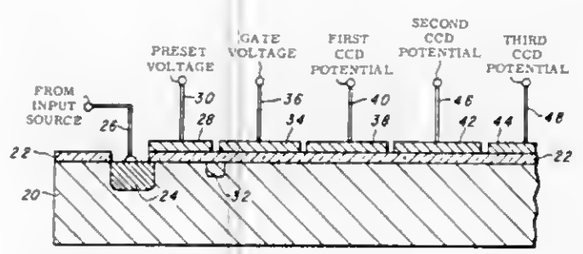
USE OF FLOATING DIFFUSION FOR LOW-NOISE ELECTRICAL INPUTS IN CCD'S

Stephen P. Emmons, Dallas, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Continuation of Ser. No. 373,568, June 25, 1973, abandoned. This application Sept. 30, 1975, Ser. No. 618,086

Int. Cl.² H01L *29/78*

U.S. Cl. 357—24 **7 Claims**



1. In a charged coupled device comprising a semiconductor substrate and phase electrodes overlying and insulated from a surface of said substrate, input structure for introducing, under control of input signals applied to said input structure, charge packets into a potential well in said substrate beneath at least one of said phase electrodes, and means for applying clock voltages to said phase electrodes for propagating said electrical charges along said substrate beneath said phase electrodes said input means comprising charge carrier source means defined adjacent said semiconductor substrate surface, said source means connected to an input terminal; a floating doped region having no directly overlying electrode thereby reducing the capacitance C of said floating doped region to less than that of said potential well beneath said one phase electrode and simultaneously reducing the kTC noise associated with said floating doped region wherein k = Boltsman's constant and T = absolute temperature, said floating doped region being of opposite conductivity type from that of said substrate, and disposed at said substrate surface between said charge carrier source means and said one phase electrode; first gating means overlying and insulated from said semiconductor substrate surface and disposed between said charge carrier source means and said floating region for receiving a voltage difference between said input terminal and said first gating means dependent on the amplitude of a signal to be inputted into the charge coupled device such that said floating region receives a quantity of charge carriers substantially free of kTC noise components from said charge carrier source means dependent on the amplitude of said input signal; second gating means overlying and insulated from said semiconductor substrate surface and disposed between said floating region and said one phase electrode for receiving a voltage concurrently with a said clock voltage received by said one phase electrode effective to transfer said quantity of charge carriers from said floating region into the potential well under said one phase electrode to store said quantity of charge carriers in said potential well.

4,028,716

BULK CHANNEL CHARGE-COUPLED DEVICE WITH BLOOMING SUPPRESSION

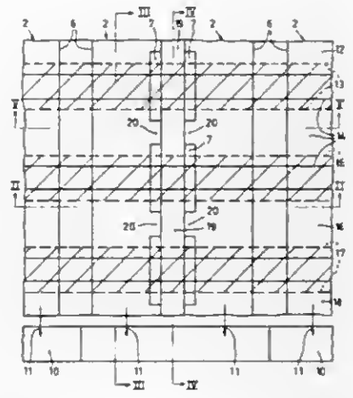
Johannes Gerrit van Santen, and Marnix Guillaume Collet, both of Eindhoven, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Aug. 19, 1974, Ser. No. 498,594

Claims priority, application Netherlands, Aug. 23, 1973, 7311600

Int. Cl.² H01L *29/78, 27/14, 31/00;* **G11C** *19/28*

U.S. Cl. 357—24 **13 Claims**



1. A radiant energy sensor of the bulk-channel charge coupled type with blooming suppression, comprising a semiconductor body having an elongated semiconductor layer of first type conductivity and serving as a storage and transfer signal channel for first type majority signal carriers generated by incident radiant energy, means for electrically isolating the layer from its surroundings, means including electrodes arranged adjacent a surface of the body and the signal channel and capable when the electrodes are electrically biased of forming a depletion zone throughout the channel thickness and of forming in the channel a series of potential wells having, within the channel and separated in the transfer direction by potential barriers, potential minima where majority carriers can be stored and further capable of transferring the carriers from well to successive well along the channel interior, and means for draining excess majority carriers comprising a semiconductor drain zone of a first type conductivity arranged in the body alongside the signal channel and directly connected to the signal channel and when electrical bias is applied cooperating with the electrical isolation means to establish between

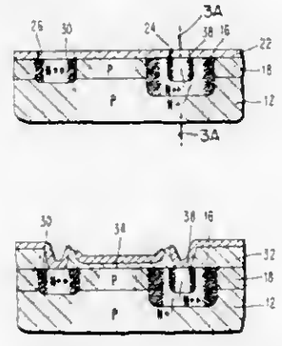
the drain zone and the storage wells an overflow potential barrier which maintains the electrical isolation of the signal channel but whose height at locations each adjacent a storage well is lower than that of the potential barrier between successive wells during storage thereby to preferentially attract excess majority carriers overflowing the storage wells, said isolating means comprising a semiconductor isolation zone of a second opposite-type conductivity which, viewed on the surface, extends in the semiconductor body parallel to and besides the signal channel and separates laterally the signal channel from the drain zone except for localized channels of the first type conductivity which interconnect the signal channel and the drain zone, said channels having a thickness and a doping concentration at which a depletion zone can be established throughout its thickness by means of an electric field so as to obtain said overflow potential barrier.

4,028,717

FIELD EFFECT TRANSISTOR HAVING IMPROVED THRESHOLD STABILITY

Richard C. Joy; Ingrid E. Magdo, both of Hopewell Junction, and Alfred Phillips, Jr., Wappingers Falls, all of N.Y., assignors to IBM Corporation, Armonk, N.Y.

Filed Sept. 22, 1975, Ser. No. 615,251
Int. Cl.² H01L 29/78
U.S. Cl. 357—23 **7 Claims**



1. An improved insulated gate field effect transistor comprising
a semiconductor substrate of a first conductivity type having source and drain regions of a second opposite type conductivity formed in a major surface thereof and defining a channel region;
a gate electrode overlying said channel region,
a layer of dielectric material underlying said gate electrode,
at least said drain region having a first region of a second type conductivity wherein the impurity concentration increases with depth, the peak concentration being spaced inwardly from said major surface, said first region defining a side of said channel region, and a second region of said second type conductivity located and encompassed within said first region and having a peak impurity concentration at said major surface, and
a drain electrode in ohmic contact with said second region.

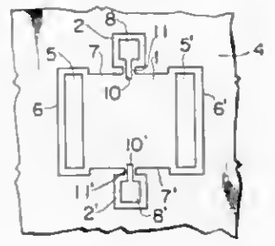
4,028,718

SEMICONDUCTOR HALL ELEMENT

Masatoshi Migitaka, Kokubunji, and Yozo Kanda, Hamamatsu, both of Japan, assignors to Hitachi, Ltd., Japan

Filed Oct. 28, 1975, Ser. No. 626,454
Claims priority, application Japan, Dec. 25, 1974, 49-148052
Int. Cl.² H01L 29/82
U.S. Cl. 357—27 **14 Claims**

1. A semiconductor Hall element comprising:
a semiconductor substrate including a first semiconductor layer of a first conductivity type and having a first surface;
a first semiconductor region of a second conductivity type, opposite said first conductivity type and having a substantially rectangularly shaped surface area, disposed beneath and extending to said first surface of sadi substrate;
a second semiconductor region of said second conductivity type, having a prescribed shaped surface area less than that of said first semiconductor region disposed beneath and extending to said first surface of said substrate, adjacent to, but spaced apart from, a first side of said first semiconductor region;
third and fourth elongated semiconductor regions of said second conductivity type and an impurity concentration higher than that of said first semiconductor region, disposed in said first semiconductor region along second and third parallel sides thereof perpendicular to said first side of said first semiconductor region;



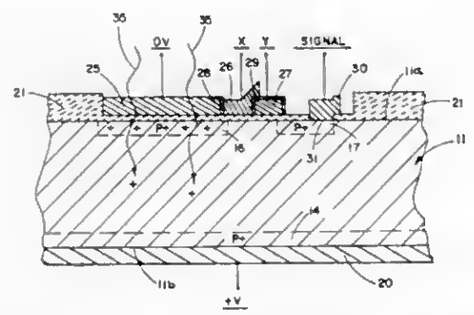
a fifth semiconductor region, of said second conductivity type and having an impurity concentration higher than that of said second semiconductor region, disposed in said second semiconductor region;
a sixth semiconductor region, of said second conductivity type, disposed beneath and extending to said first surface of said substrate and being contiguous with said first and second semiconductor regions; and
a seventh semiconductor region of said second conductivity type and having an impurity concentration higher than that of said first semiconductor region, disposed in said sixth semiconductor region so as to be contiguous with said fifth semiconductor region and overlapping said first side of said first semiconductor region.

4,028,719

ARRAY TYPE CHARGE EXTRACTION DEVICE FOR INFRA-RED DETECTION

Orlie L. Curtis, Culver City, Calif., assignor to Northrop Corporation, Los Angeles, Calif.

Filed Mar. 11, 1976, Ser. No. 666,165
Int. Cl.² H01L 27/14, 29/78
U.S. Cl. 357—30 **9 Claims**



1. An infra-red detector array comprising a plurality of detector elements, each of said elements comprising:
a substrate of an extrinsic semi-conductor material adapted to generate majority carriers in response to infra-red radiation, said substrate having front and back surfaces through either of which such radiation passes,
a plurality of majority carrier diffused regions separated from each other and formed along the front surface of the substrate,
a layer of dielectric material on said front surface,

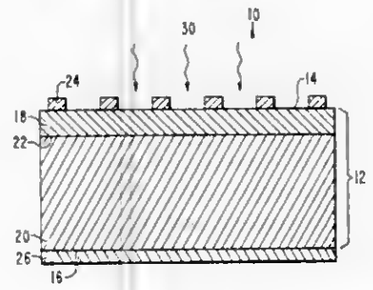
a collector electrode deposited over said dielectric layer opposite one of said diffused regions, thereby forming a storage capacitor,
a conductive signal line deposited on said dielectric layer opposite and making electrical contact with another of said diffusion regions, and
conductive address line means deposited over said dielectric and positioned between said collector electrode and said signal electrode,
a biasing potential being applied to said collector electrode so as to attract the majority carriers generated in said substrate by said radiation toward said collector electrode,
whereby when addressing signals are simultaneously received at both address line means of any detector element, said majority-carrier charge stored in the capacitor formed by the collector electrode, the dielectric layer, and the top surface of the substrate is transferred to the signal line.

4,028,720

PHOTOVOLTAIC DEVICE

Jacques Isaac Pankove, Princeton, N.J., assignor to RCA Corporation, New York, N.Y.

Filed May 24, 1976, Ser. No. 689,181
Int. Cl.² H01L 27/14
U.S. Cl. 357—30 **10 Claims**



1. A semiconductor photovoltaic device comprising:
a body of silicon having therein gallium and arsenic paired molecular impurities in a concentration on the order of 10^{18} impurity pairs per cubic centimeter or greater, said body having an incident surface on which solar radiation is capable of impinging, and said body having means for forming a built-in electric field.

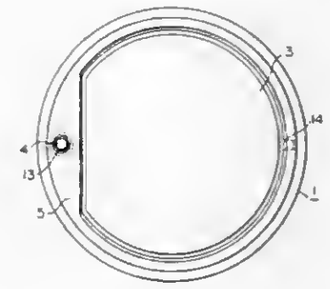
4,028,721

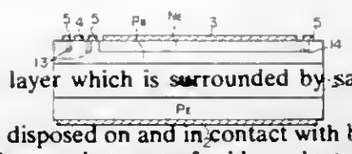
SEMICONDUCTOR CONTROLLED RECTIFIER DEVICE

Tsutomu Yatsuo, and Katsumi Akabane, both of Hitachi, Japan, assignors to Hitachi, Ltd., Japan

Filed July 22, 1974, Ser. No. 490,300
Claims priority, application Japan, Aug. 1, 1973, 48-85827; Aug. 31, 1973, 48-97171
Int. Cl.² H01L 29/74
U.S. Cl. 357—38 **3 Claims**

1. A semiconductor controlled rectifying device comprising:
a semiconductor substrate including
a first layer of a first conductivity type,
a second layer having a second conductivity type, opposite said first conductivity type, and forming a first PN junction with said first layer adjacent thereto,
a third layer having said first conductivity type and forming a second PN junction with said second layer adjacent said third layer,
a fourth layer having said second conductivity type and forming a third PN junction with said third layer, said fourth layer being buried in said third layer with its surface exposed, and
a fifth layer in ring form isolated from said fourth layer by said third layer and buried in said third layer with its surface exposed, said fifth layer forming a fourth PN junction with said third layer and having said second conductivity type, said fifth layer having a smaller area than said fourth layer;
a first main electrode in ohmic contact with at least the surface of said first layer;
a second main electrode in ohmic contact with at least the surface of said fourth layer;
a gate electrode in contact with that part of the surface of





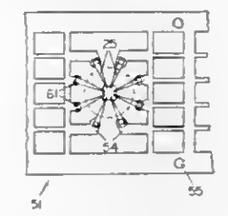
said third layer which is surrounded by said fifth layer; and
a conductor disposed on and in contact with both said third and fifth layers, that part of said conductor disposed on said third layer extending along the periphery of said fourth layer spaced-apart from the periphery thereof by constant distance and a portion of said part of said conductor being in contact with said periphery of said fourth layer.

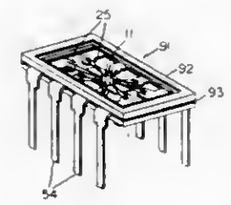
4,028,722

CONTACT BONDED PACKAGED INTEGRATED CIRCUIT

Robert W. Helda, Hollywood, Fla., assignor to Motorola, Inc., Chicago, Ill.

Division of Ser. No. 80,378, Oct. 13, 1970, Pat. No. 3,698,073, which is a continuation of Ser. No. 691,041, Dec. 15, 1967, abandoned. This application Oct. 10, 1972, Ser. No. 296,185
Int. Cl.² H01L 23/48, 29/44; H02G 13/08
U.S. Cl. 357—70 **2 Claims**





1. An encapsulated semiconductor device having metal lead portions inside and outside the encapsulation extending from a semiconductor unit, said metal lead portions being originally a part of two substantially flat metal frame means each said means provided in a generally strip-like configuration and each said means comprising a plurality of identical frame members spaced apart on each said metal frame means and

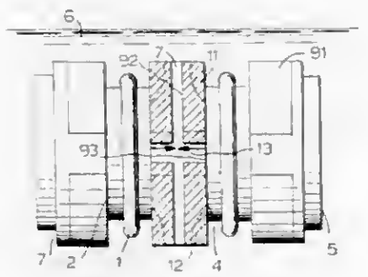
each frame member providing the metal lead portions for an ultimate semiconductor device, with the first of said metal frame means having lead portions each with an inner end portion and an outer end portion adapted to have semi-conductor means bonded to the lead portions thereof and being characterized by a flexibility which permits it to be wound on a spool for storage after semiconductor means are bonded thereto, and with the second of said metal frame means having frame members each of which is larger in area than a frame member of the first metal frame means and being stiffer and less flexible than said first metal frame means and not capable of being wound on a spool, said metal lead portions of said semiconductor device comprising the lead portions in a frame member from said first metal frame means extending outwardly from a central area at the inner end portions of the lead portions thereof, semiconductor means bonded to said first frame means lead portions at said inner end portions and said central area, said metal lead portions in said semiconductor device also having said second metal frame means bonded respectively to the outer end portions of said first frame means lead portions, said semiconductor unit and said first metal frame means lead portions and at least the bonded portion with said second metal frame means lead portions being in said encapsulation, and a portion of each of the latter lead portions extending out of said encapsulation for said device for connection with apparatus with which said semiconductor device is to be operated.

4,028,723

COOLING DEVICE FOR HEAT GENERATION MEMBER

Yoshiro Shikano, and Yasuhiro Ueoka, both of Amagasaki, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Feb. 24, 1975, Ser. No. 552,145
Int. Cl.² H01L *23/02, 25/04, 23/12*
U.S. Cl. 357—82 **4 Claims**



1. A cooling device comprising:

a plurality of planar semiconductor elements having a pair of flat surfaces on opposite sides thereof;

a plurality of planar cooling members having a pair of flat surfaces on opposite sides therof, each planar cooling member positioned between and abutting the flat surfaces of a pair of said semiconductor elements, and each planar cooling member having a plurality of parallel, vertical first passageways therein between the circumference thereof and at least one second passageway therethrough between said two opposite flat surfaces transverse to and through at least one of said first passageways and opening against the surface of at least one of said semiconductors abutting said cooling member; and

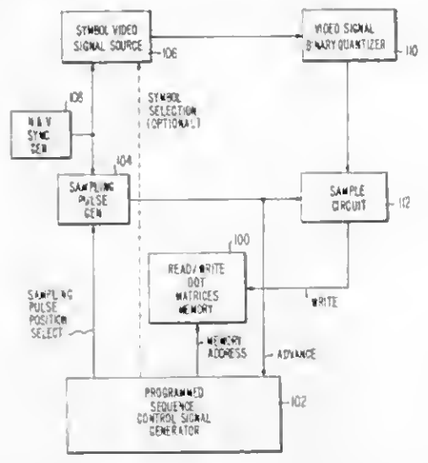
an electrically insulative refrigerant liquid completely surrounding said semiconductor elements and said cooling members and filling said first and second passageways in said cooling member, said refrigerant liquid having a boiling point less than the rated temperature of said semiconductor element.

4,028,724

READ/WRITE CHARACTER GENERATOR MEMORY LOADING METHOD

Ross Chipman Graham, Point Claire, Canada, assignor to RCA Corporation, New York, N.Y.

Filed Nov. 10, 1975, Ser. No. 630,651
Int. Cl.² H04N *5/66*
U.S. Cl. 358—160 **4 Claims**



1. A method for loading a read/write character generator memory with a plurality of different symbols for use in displaying selected ones of said symbols on a display device exhibiting a television raster scan during readout of said memory; said memory storing each respective one of said plurality of different symbols in two-dimensional dot matrix form at a separate address location thereof with all dot matrices having the same size first dimension and the same size second dimension, whereby any dot within any dot matrix is completely specified by the address location of that dot matrix, the ordinal line along the first dimension in which that dot is located and the ordinal position along that line in said second dimension in which that dot is located; said method comprising the steps of:

a. deriving a video signal at a predetermined horizontal sync rate and a predetermined vertical sync rate of a television frame of information including a single given one of said symbols located within a given window of said frame, which window corresponds with a dot matrix having first and second dimensions which are an integral multiple including unity of the first and second dimensions of said dot matrices of said memory, said window covering at least a preselected portion of said frame;

b. quantizing said video signal to produce an output manifesting a first binary value in response to said video signal being at at least a first given level and a second binary value in response to said video signal being below said first given level;

c. deriving at said predetermined horizontal sync rate and vertical sync rate a sampling pulse which occurs at a preselected position within said window of said frame and corresponds with a predetermined ordinal line and a predetermined ordinal position along that line of said window dot matrix;

d. sampling said quantized output with said sampling pulse to determine the binary value of said quantized output sample during the occurrence of said sampling pulse;

e. assigning a given address location in said memory to said given one of said symbols, and

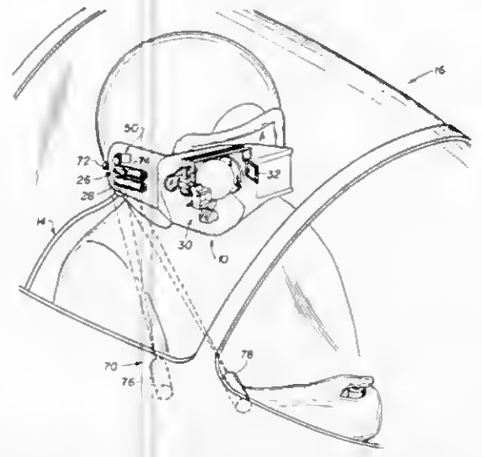
f. storing the binary value of said sampled quantized output at the dot position located at said predetermined ordinal line and predetermined ordinal position along that line of the dot matrix of said memory having said assigned address location.

4,028,725

HIGH-RESOLUTION VISION SYSTEM

Edgar B. Lewis, Garden City, N.Y., assignor to Grumman Aerospace Corporation, Bethpage, N.Y.

Filed Apr. 21, 1976, Ser. No. 679,035
Int. Cl.² H04N *7/18*
U.S. Cl. 358—103 **10 Claims**



1. A high-resolution vision system for an observer having a field of view related to a predetermined reference axis comprising:

a helmet worn on the head of the observer;

apparatus on said helmet for mounting eye-tracking display means having an image presentation which is slaved to the eye line of sight of the observer;

a remote source of visual information including at least a first and a second pick-up sensor;

servo means for adjusting the orientation of said remote source with respect to said reference axis, the angular orientation thereof with respect to said axis being related to the angular orientation of said helmet and the eye angle of said observer;

communications means between said remote source and said helmet-mounted display means for transmitting visual information signals and control signals therebetween;

at least a first and a second light projecting means in said display means for producing light-information signals in response to visual information derived from said remote source;

means inserting said light signals from said first projecting means into a selected area of said light signals from said second light projecting means;

angularly adjustable optical means in said display means for superimposing the combined image of said light signals of the field of view of the observer by directing light carrying said signals into at least one eye of the observer with the area of the inserted image having a predetermined relationship with said line of sight;

monitoring means operatively associated with said helmet for measuring angular displacement thereof with respect to said reference axis and for producing control signals indicative of such angular displacement;

monitoring means operatively associated with said display means for measuring angular displacement of said optical superimposing means with respect to said eye line of sight and for producing control signals indicative of such angular displacement;

means responsive to said control signals from said eye line of sight monitoring means for adjusting the orientation of said optical superimposing means such that the orientation of said light information signals viewed by the observer remains substantially constant with respect to said eye line of sight; and

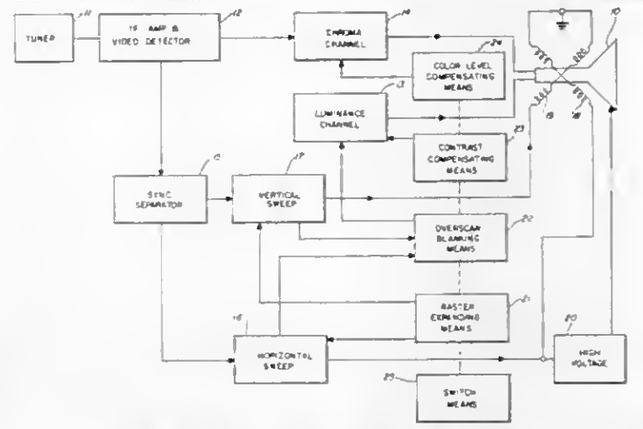
means responsive to the control signals from both said eye line of sight monitoring means and said helmet angle monitoring means for adjusting the angular orientation of said remote visual information source such that the angular orientation thereof remains substantially constant with respect to said line of sight.

4,028,726

TV RECEIVER RASTER EXPANSION SYSTEM

Thomas W. Argy, Chicago, Ill., assignor to Zenith Radio Corporation, Glenview, Ill.

Filed Jan. 27, 1975, Ser. No. 544,249
Int. Cl.² H04N *5/44;* **H01J** *29/70*
U.S. Cl. 358—165 **1 Claim**



1. In a television receiver of the type comprising a cathode ray picture tube having an image display screen and means responsive to received television signals including video signal components and horizontal vertical synchronizing components for scanning said screen with one or more electron beams in a rectangular coordinate pattern to produce an image raster having a predetermined aspect ratio, the improvement which comprises:

means for expanding said raster in both horizontal and vertical directions, such raster expansion resulting in overscan of said screen by said one or more electron beams during intervals corresponding to peripheral image portions;

overscan interval blanking means responsive to said horizontal synchronizing component and a vertical deflection component internally derived from said vertical synchronizing component, for developing a composite blanking signal to blank said one more electron beams during said overscan interval, said overscan interval blanking means being a common circuit, comprising:

an adjustable integrating network for reshaping said horizontal synchronizing component;

an adjustable amplitude control means for resizing said vertical deflection component;

diode gate circuitry coupled to said adjustable integrating network and said adjustable amplitude control means for partitioning the positive-going portions from the negative-going portions of said reshaped horizontal synchronizing component and said vertical deflection component;

modifying means coupled to said diode gate circuitry for processing said positive-going portions of said reshaped horizontal synchronizing component and said vertical deflection component;

pulse generating means coupled to said modifying means and said diode gate circuitry means for combining said negative-going portions and said processed positive-going portions of said reshaped horizontal synchronizing component and of said vertical deflection component and for combining said processed reshaped horizontal synchronizing component and said processed vertical deflection component; and

a buffer stage coupled to said pulse generating means for generating said composite blanking signal; and

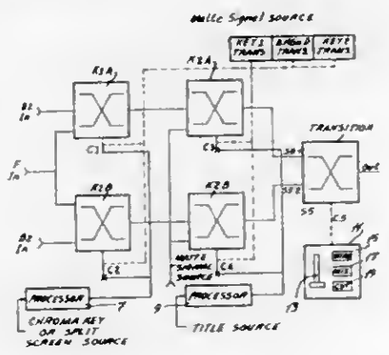
switch means for concomitantly actuating said raster expanding means and overscan interval blanking means.

4,028,727

MIX/EFFECTS SWITCH ARRANGEMENT AND MIX/EFFECTS SWITCHING SYSTEM

Ole Skrydstrup, Pointe Claire, Canada, assignor to Central Dynamics Ltd., Canada

Filed May 7, 1976, Ser. No. 684,360
Int. Cl.² H04N *5/22*
U.S. Cl. 358—181 **11 Claims**



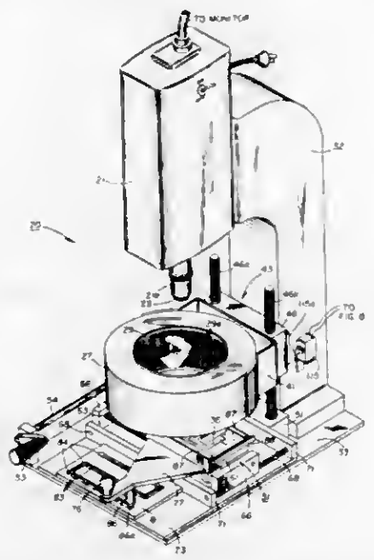
1. A mix/effects switch arrangement comprising:
a plurality of switches, each of said switches comprising two input terminals, an output terminal and a control terminal;
one of said switches comprising an output switch;
a first number of said plurality of switches being serially arranged to provide a first feedline to one input terminal of said output switch;
a second number of said plurality of switches being serially arranged to provide a second, parallel, feedline to the other input terminal of said output switch;
said output switch comprising a soft switch.

4,028,728

METHOD OF AND VIDEO SYSTEM FOR IDENTIFYING DIFFERENT LIGHT-REFLECTIVE SURFACE AREAS ON ARTICLES

Benny H. Sharp, Yukon, Okla., assignor to Western Electric Company, Inc., New York, N.Y.

Filed Apr. 2, 1976, Ser. No. 672,914
Int. Cl.² H04N *7/18*
U.S. Cl. 358—106 **29 Claims**



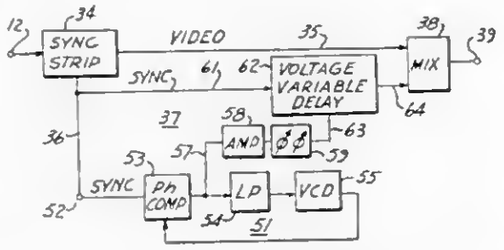
1. A video system for selectively ascertaining the presence and absence of, and for discriminating between, at least two distinctively different types of light-reflective surface areas formed on a common, exposed surface of a prepositioned object, one type of surface area being substantially two-dimensional, and the other type being substantially three-dimensional, said system comprising:
means for illuminating the exposed surface of said object with polarized light that extends across said surface such that in a direction at least substantially perpendicular thereto: (1) reflected light is minimized from those light-reflective areas on said surface having a substantially smooth, planar, two-dimensional profile, and (2) reflected light is maximized from those light-reflective areas on said surface having a three-dimensional profile;
video camera means positioned such that the axis of said lens thereof is oriented substantially perpendicularly to both the exposed surface of the object and the light ray paths of said polarized light for receiving the minimized and maximized patterns of reflected light from said respectively different types of surface areas, and for generating video signals that produce contrasting patterns representative thereof when displayed on the screen of a video monitor, and
a video monitor electrically connected to said camera for producing said contrasting patterns.

4,028,729

PROVISION AND DISPLAY OF VIDEO SIGNALS

Lewis B. Browder, Altadena, Calif., assignor to Bell & Howell Company, Chicago, Ill.

Filed Mar. 25, 1975, Ser. No. 561,958
Int. Cl.² H04N *5/04, 5/785*
U.S. Cl. 358—148 **39 Claims**



23. In apparatus for enhancing flutter in an electrical signal affected by flutter, the improvement comprising in combination:
first phase lock loop means having input means for receiving said flutter-affected signal, first loop filter means, and output means;
second phase lock loop means having input means connected to said output means of the first phase lock loop means, second loop filter means, and output means;
means connected between said first and second said lock loop means for deriving an error signal from sid first phase lock loop means ahead of said first loop filter means and applying said derived error signal to said second phase lock loop means after said second loop filter means; and
means for deriving an output signal with enhanced flutter from said output means of the second phase lock loop means.

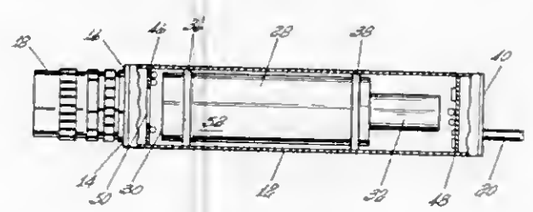
25. In a method of improving the display of video information contained in picture signals affected by flutter and synchronized by synchronizing signals subjected to processing by means for stabilizing synchronizing signals against at least part of said flutter, the improvement comprising the steps of:
compensating said stabilizing function to preserve flutter in said synchronizing signals; and
synchronizing said video signals for said display of vidoe information by synchronizing signals affected by essentially the same flutter as said picture signals;
said stabilization of synchronizing signals including attenuation of signals having flutter frequencies above a predetermined frequency; and
said compensation of said stabilizing function including the step of enhancing the flutter amplitude of said synchronizing signals having said flutter frequencies substantially inversely proportional to said attenuation.

4,028,730

VIDICON CAMERA FOR CLOSED CIRCUIT TELEVISION SYSTEM

Frederick A. Miller, Santa Barbara, Calif., assignor to Circon Corporation, Santa Barbara, Calif.

Filed May 17, 1976, Ser. No. 687,314
Int. Cl.² H04N *3/16*
U.S. Cl. 358—217 **17 Claims**



1. A video camera head for use in a direct wire television system comprising
a video camera tube having an imaging surface for receiving an optical image thereon and for genertng a composite video signal representing a said optical image;
a metal housing having means defining an opening therethrough enabling a said optical image to impinge on said imaging surface, said housing enclosing and supporting said vidicon tube with the imaging surface thereof spaced in axial alignment a predetermined distance from the opening;
a first printed circuit board having an aperture extending axially therethrough of a dimension substantially equal to said opening, said first printed circuit board being positioned in said housing between said opening and said imaging surface with said aperture in axial alignment with said opening and said imaging surface, said first printed circuit board including
preamplifier means electrically connected to said vidicon tube for receiving said composite video signal and for producing an amplified additive composite video signal therefrom;
a second printed circuit board positioned between the end of the vidicon tube opposite to and in axial alignment with said imaging surface and said housing, said second printed circuit board including
amplifier means for amplifying in phase the composite video signal with a predetermined gain;
emitter follower amplifier means electrically connected to said amplifier means and adapted to drive a coaxial cable with said amplified composite video signal; and
conductor means electrically connected between said vidicon tube, said first printed circuit board, said second printed circuit board and a video processor.

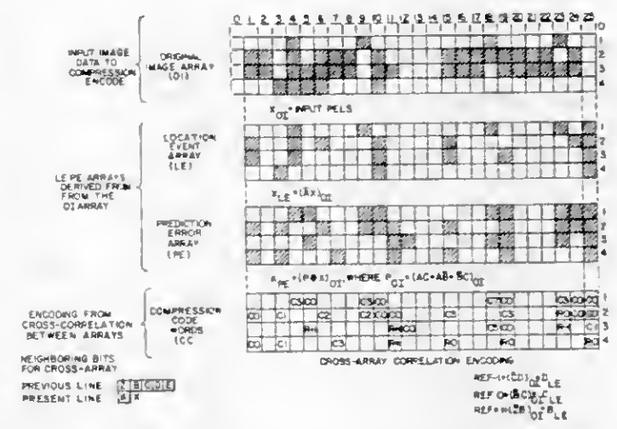
APPARATUS FOR COMPRESSION CODING USING CROSS-ARRAY CORRELATION BETWEEN TWO-DIMENSIONAL MATRICES DERIVED FROM TWO-VALUED DIGITAL IMAGES

Ronald Barthold Arps, Stanford, Calif.; Lalit Rai Bahl, Amawalk, and Arnold Weinberger, Poughkeepsie, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Sept. 29, 1975, Ser. No. 617,906
Int. Cl.² H04N *7/12*
U.S. Cl. 358—260 **11 Claims**

1. An apparatus for compression coding a $p \times q$ array of Boolean coded points applied to the apparatus in consecutive raster scan lines, said apparatus comprising:
means **(10, 12, 9)** for forming a high-order $p \times q$ prediction error array and an auxilliary $p \times q$ array of location events from the consecutive raster scan lines of the $p \times q$ array of Boolean coded points;
means **(8, 12, 61, 65, 63)** for counting runs C between consecutive pairs of errors in the prediction error array;
means **(14)** for forming a line difference codeword with difference value v upon the joint event of C>T where T is a threshold and either the single or multiple occurrence of location events in the ith-1 scan line of the location event array within the bit position range of $B \leq r \leq (j+n)$,



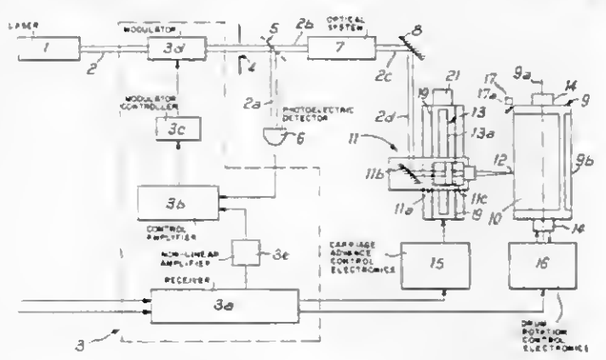
where positive integer B is the greater of function $D(T,v)$ and $(j-n)$, and the number of intervening location events, s, within the bit position range from search start position $D(T,v) \leq q < (j-n)$ not exceeding some limit m, where m, n, q, r and s are positive integers; and
means **(14)** for forming a compression code word from the run-length count C between consecutive errors, in response to the occurrence of each error in the jth bit position of the ith scan line of the prediction error array upon either $C \leq T$ or $C>T$ and there being no occurrence of a line difference encoding for the error, where i, j, C and T are positive integers.

4,028,732

APPARATUS AND METHOD FOR DISPLAY OF IMAGES

Lucien Salter, 9 Allee circulaire, and Gabriel Maincent, 24 Allee circulaire, both of 27200 Foret de Vernon, France

Continuation-in-part of Ser. No. 447,366, March 1, 1974, abandoned. This application Feb. 11, 1976, Ser. No. 657,281
Claims priority, application France, Mar. 2, 1973, 73.07567
Int. Cl.² H04N *1/06*
U.S. Cl. 358—289 **19 Claims**



1. An apparatus for displaying an image tele-transmitted in the form of electric or electromagnetic signals, the image being formed by a plurality of parallel lines each comprising a plurality of points, the apparatus comprising a drum having a cylindrical surface; magnetic bearing means supporting said drum for rotation about its axis of revolution; a carriage; carriage driving means for driving said carriage in stepwise manner for translational movement parallel to said axis of said

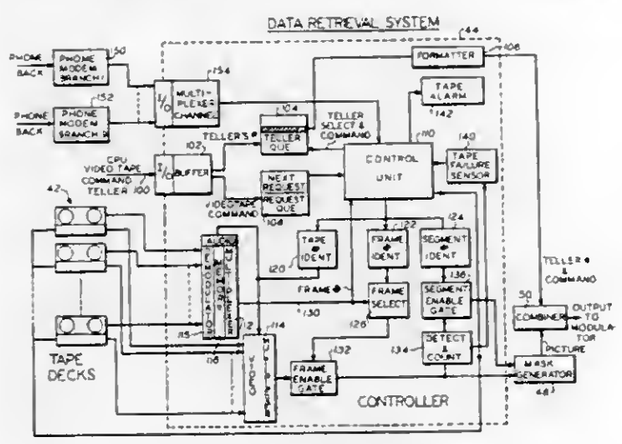
drum; friction means for damping out and rapidly stabilising the carriage position at the end of each movement step; a light source; beam directing means for directing a beam of light from said light source towards said cylindrical surface of said drum; an optical system disposed to lie in the path of the beam from said light source, said beam directing means including means for transmitting the beam along a path parallel to said axis in a direction towards said carriage, means carried on said carriage for intercepting the beam in said path and for deflecting it perpendicularly to said drum axis in a direction towards said drum and means for focusing an image formed in said optical system at the point of impact of the beam on said drum; receiving means responsive to the electric or electromagnetic signals for providing signals representative of an image to be displayed and first synchronizing signals; a light intensity modulator connected to said receiving means to vary the intensity of the beam of light as a function of the signals representative of the image to be displayed; first control means connected to said receiving means and to said carriage driving means to control stepwise movement of said carriage in response to the first synchronzing signals; and second control means connected to said receiving means to control the speed of rotation of said drum.

4,028,733

PICTORIAL INFORMATION RETRIEVAL SYSTEM

Edward M. Ulicki, East Paterson, N.J., assignor to Telebeam Corporation, Paramus, N.J.

Filed July 7, 1975, Ser. No. 593,680
Int. Cl.² H04N *5/785*; **G11B** *15/40*
U.S. Cl. 360—10 **35 Claims**



1. A system for retrievably providing a video display of an information message on a video display means, said system comprising:

a video tape storage media having a plurality of said video displayable messages storable thereon, said video tape storage media having a first audio track having identification information stored therein and a video track having video information stored therein, said video information comprising a plurality of video displayable frames, each of said frames being capable of providing a video signal containing the video displayable information within said frame and comprising a plurality of frame segments, each of said frame segments containing one of said video displayable messages and being capable of providing a portion of said frame video signal containing said one message, said first audio track identification information comprising a plurality of different unique frame identification codes, each frame code being uniquely associated with one frame of said plurality of frames, each of said frame video signals further comprising a plurality of horizontal sync pulses for the video display of said frame video signal, each of said sync pulses being associated with a displayable video scan line, each of said frame segment video signal portions of said frame video signal comprising a predetermined portion of the plurality of displayable video scan lines associated with said frame video display having a corresponding predetermined portion of said plurality of horizontal sync pulses;

means for selecting a unique video displayable message for video display thereof, said selection means providing a unique selection control signal uniquely corresponding to said selected message;

means for scanning said storage media in response to said selection control signal for initiating selection of said unique video displayable message, said scanning means comprising means for subsequently providing said video display from said storage media and means responsive to said first audio track frame identification information for providing a frame location signal;

first condition responsive means operatively connected to said scanning means for retrieving the frame containing said selected message in response to detection of the frame location signal associated with said frame containing said selected message and for counting the horizontal sync pulses in said retrieved frame for providing a display control signal for retrieving said frame segment containing said selected message in response to detection of the count associated with said selected message containing segment; and

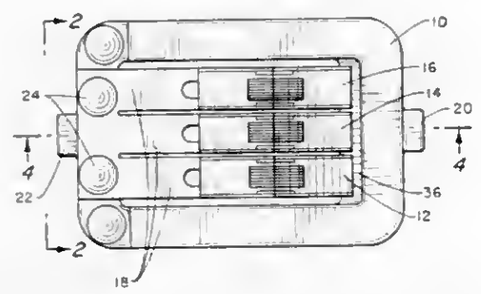
mask generator means operatively connected to said first condition responsive means for providing a composite video displayable output signal to said video display means, said mask generator means providing said single frame segment containing said selected message as said output signal in response to receipt of said display control signal and blanking said entire frame in the absence of receipt of said display control signal; whereby the audio track of a video tape storage media enables a single frame segment to be selectively retrieved from a plurality of frames of video information stored in the video track of said video tape storage media for video display of said frame segment.

4,028,734

PLURAL MAGNETIC HEAD ASSEMBLY WITH INDEPENDENTLY SUPPORTING STRUCTURE

Robert J. Mos, Huntington Beach, Calif., assignor to American Magnetics Corporation, Torrance, Calif.

Continuation of Ser. No. 578,449, May 19, 1975, abandoned. This application Sept. 22, 1976, Ser. No. 725,902
Int. Cl.² G11B *21/16*, *5/48*
U.S. Cl. 360—104 **7 Claims**



1. Signal transducing magnetic head assembly means comprised:

a carrier frame,

mounting means on said frame for pivotally mounting said frame,

a plurality of magnetic heads disposed within said frame,

each said head being mounted to said frame by a plurality of parallelepiped,

each spring having one end fixedly mounted to said frame and the opposite end fixedly mounted to its corresponding head,

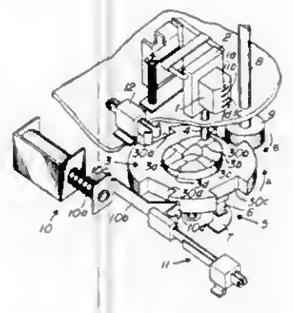
whereby, by flexing of said springs, each said head may translate individually, without rotating, on a line substantially normal to the plane of said frame.

4,028,735

HEAD INDEXING APPARATUS FOR A COMBINED TWO AND FOUR CHANNEL TAPE PLAYER/RECORDER

Toru Miyazaki, Iwaki, Japan, assignor to Alps Motorola, Inc., Tokyo, Japan

Filed Sept. 15, 1975, Ser. No. 613,712
Claims priority, application Japan, Sept. 17, 1974, 49-111888[U]
Int. Cl.² G11B *5/55*, *21/08*, *23/04*
U.S. Cl. 360—106 **9 Claims**



1. In a combined two and four channel tape player, a head indexing apparatus comprising:

a rotary body rotatably into a first number of fixed rotary positions and having a plurality of different cam surfaces;

magnetic head means for monitoring a magnetic tape, said head means coupled to said rotary body and having its position determined by the rotary position of said rotary body;

rotation means coupled to said rotary body for sequentially indexing said body into each of said first number of fixed rotary positions in response to the receipt of an actuation signal;

actuation means coupled to said rotation means for providing an initial actuation signal when a change in the position of the magnetic head means is desired; and

selection means coupled to said rotation means for selectively designating several of said first number of rotary positions as desired positions and controlling, by selectively creating additional actuation signals, the rotation of said rotary body by said rotation means so that said rotary body is sequentially rotated into each of said desired positions in response to the providing of said initial actuation signal by said actuation means, said selection means including a portion of a rotary switch rotated in association with said rotary body and an additional switch electrically connected in series with said rotary switch and being actuated during the rotation of said rotary body into each of said first number of positions, said rotary switch and said additional switch creating said additional actuation signals.

4,028,736

MOTOR PROTECTION CIRCUIT UNIT

James R. Willson, Trumbull, Conn., and Hugh J. Tyler, Santa Ana, Calif., assignors to RobertShaw Controls Company, Richmond, Va.

Filed Dec. 19, 1975, Ser. No. 642,219
Int. Cl.² H02H *7/08*
U.S. Cl. 361—29 **13 Claims**

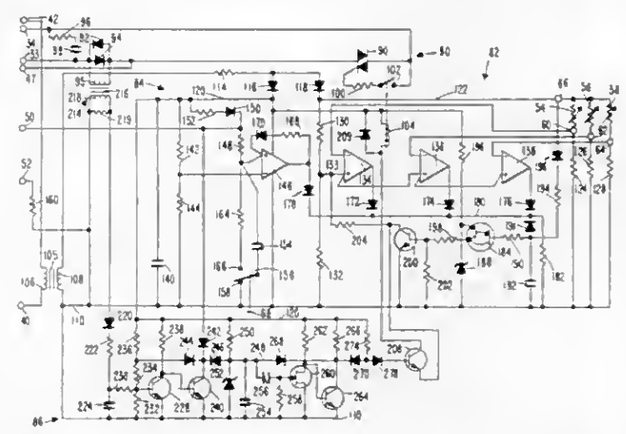
1. A protection circuit unit for connection in a motor system including a contactor having a contactor winding and contacts operated when the contactor winding is energized to connect the motor to an electrical source, the circuit unit comprising

a pair of terminals adapted to be connected in series with the contactor winding across an AC source,

a contactor energization circuit connected between the pair of terminals,

said contactor energization circuit including switch means for controlling the energization of the contactor winding,

said contactor energization circuit further including current sensing means connected in series with the switch means in the contactor energization circuit for producing a



signal only during current flow through the contactor winding,

said current sensing means being independent of which terminal of the pair of terminals the contactor winding is connected with, and

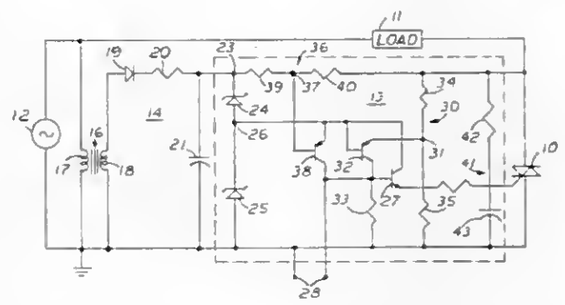
delay after break means responsive to termination of the signal from the current sensing means for preventing operation of the switch means for a predetermined duration after the termination of the signal from the current sensing means.

4,028,737

TRANSIENT VOLTAGE PROTECTION CIRCUIT

Ronald L. Bailey, Rockford, Ill., assignor to Barber-Colman Company, Rockford, Ill.

Filed Apr. 2, 1975, Ser. No. 564,540
Int. Cl.² H02H *3/20*
U.S. Cl. 361—86 **9 Claims**



1. A transient voltage protection circuit for a thyristor connected through the power and common terminals thereof in series with a load controlled thereby and an AC power supply, said circuit comprising a voltage divider and said thyristor through the power and common terminals thereof in parallel circuits, a tap on the voltage divider providing a control voltage as a function of the instantaneous voltage on said AC supply, a source of regulated DC reference voltage at a magnitude below the control voltage corresponding to a thyristor destructive voltage on said AC supply, a source of turn-on voltage, and means for selectively coupling said thyristor through a gate and the common terminal thereof across the source of turn-on voltage in response to said control voltage exceeding the reference voltage.

4,028,738

CENTRAL CIRCUIT CONTROL PLATES FOR AUTOMOTIVE VEHICLES

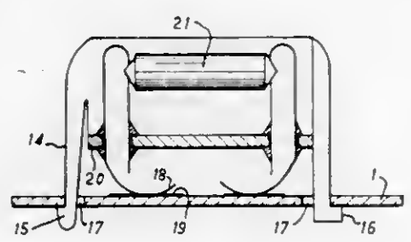
Philippe Rouvre, and Daniel Jean Augello, both of Billancourt, France, assignors to Regie Nationale des Usines Renault and Automobiles Peugeot, both of, France

Filed Apr. 30, 1973, Ser. No. 355,424

Claims priority, application France, May 10, 1972, 72.16824

Int. Cl.² H05K *5/00*

U.S. Cl. 361—403 **1 Claim**



1. A central circuit control plate for the electrical equipment of motor vehicles, the equipment including different control devices on a vehicle dashboard emitting control information, safety devices and load circuits or receivers receiving said information, and a source of current to which said receivers are connected by means of said control devices, wherein said control plate comprises:

a single compact central unit including a predetermined circuit unit for distributing the control information to different load circuits or receivers which are all spaced apart from said control plate, means for transmitting said information, and intermediate safety and control members, connected between said predetermined circuit unit and said means for transmitting, for sending control information from said different control devices to said different load circuits or receivers of the vehicle;

a detachable printed circuit assembly plate having a plurality of controlled circuits, an input connector on the assembly plate connecting the controlled circuits to said source of current and to said means for transmitting, and an output connector connecting said printed circuit assembly plate to the different load circuits or receivers, intermediate safety and control members including fuses, circuit breakers, relays, and a flasher unit for direction indicators;

snap-action means for rapidly fixing to and removing from said assembly plate said intermediate safety and control devices when connecting to and disconnecting from said controlled circuits said safety and control devices; and

wherein said snap-action means comprises resilient legs provided at their free ends with claws and wherein said assembly plate is provided with apertures corresponding to said legs, said claws fitting in a snap fashion into said apertures, said intermediate safety and control devices further comprising resilient metal shoes connected to terminals of said intermediate safety or control devices and engaging corresponding strips of said controlled circuits, said snap-action means being integral with a box for an intermediate safety and control device.

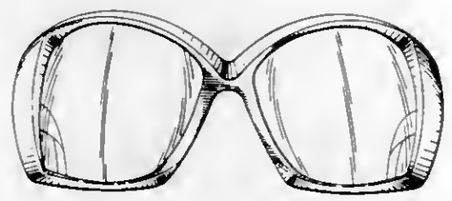
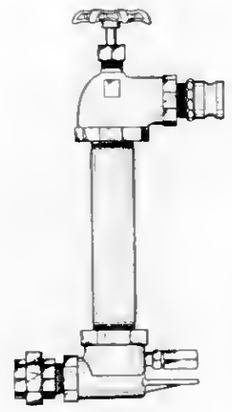
David W. Johnsen, Woodstock, Conn., assignor to American Optical Corporation, Southbridge, Mass.
Filed Oct. 28, 1975, Ser. No. 625,983
Term of patent 14 years
Int. Cl. D16—*06*
U.S. Cl. D16—65



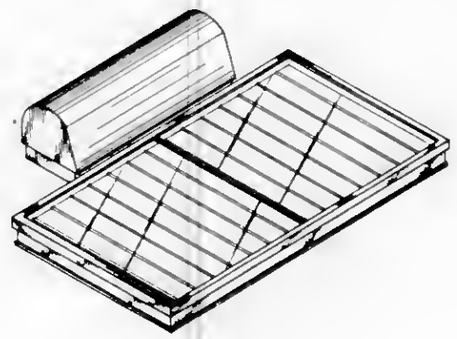
244,604
CORDLESS ELECTRIC PENCIL SHARPENER
Yoshiro Ohta, Tokyo, Japan, assignor to Esquire Trading Co., Ltd., Tokyo, Japan
Filed Dec. 31, 1975, Ser. No. 645,865
Claims priority, application Japan, Oct. 1, 1975, 50-039665
Term of patent 14 years
Int. Cl. D19—*06*
U.S. Cl. D19—73

244,605
FROSTPROOF HYDRANT
H. Ronald Ratnik, 222 Weymouth Drive, Rochester, N.Y. 14625
Filed Nov. 5, 1975, Ser. No. 629,044
Term of patent 14 years
Int. Cl. D23—*01*
U.S. Cl. D23—12

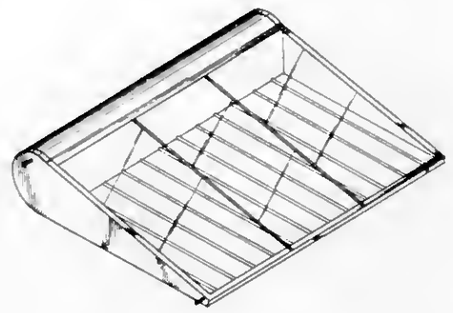


244,606
SOLAR WATER HEATING UNIT
Harry John Riley, Perth, Australia, assignor to S. W. Hart & Co. Pty. Ltd., Australia
Filed Sept. 17, 1975, Ser. No. 614,095
Claims priority, application Australia, July 29, 1975, 67474/75
Term of patent 14 years
Int. Cl. D23—*03*
U.S. Cl. D23—127

244,607
SOLAR WATER HEATING UNIT
Harry John Riley, Perth, Australia, assignor to S. W. Hart & Co. Pty. Ltd., Australia
Filed Sept. 17, 1975, Ser. No. 614,096
Claims priority, application Australia, July 29, 1975, 67473/75
Term of patent 14 years
Int. Cl. D23—*03*
U.S. Cl. D23—127

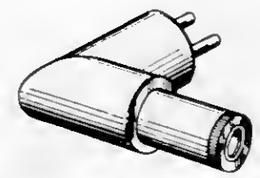


244,608
SOLAR WATER HEATING UNIT
Harry John Riley, Perth, Australia, assignor to S. W. Hart & Co. Pty. Ltd., Australia
Filed Sept. 17, 1975, Ser. No. 614,097
Claims priority, application Australia, July 29, 1975, 67470/75
Term of patent 14 years
Int. Cl. D23—*03*
U.S. Cl. D23—127

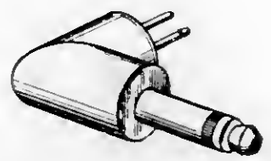


244,609
DENTAL FLOSS HOLDER
Ingram S. Chodorow, Stamford, Conn., assignor to Placontrol, Inc., Stamford, Conn.
Filed Oct. 31, 1975, Ser. No. 627,881
Term of patent 14 years
Int. Cl. D24—*99*
U.S. Cl. D28—64

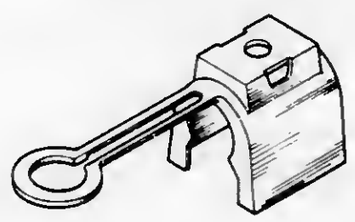
244,610
ELECTRICAL ANGLE PLUG
James J. Gietzen, Smithtown, N.Y., assignor to Dynamic Instrument Corporation, Hauppauge, N.Y.
Filed Oct. 24, 1975, Ser. No. 625,537
Term of patent 7 years
Int. Cl. D13—*03*
U.S. Cl. D13—28



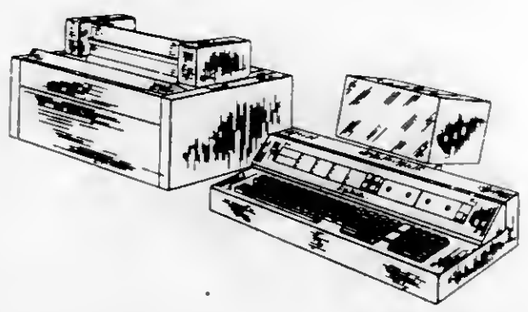
244,611
ELECTRICAL ANGLE PLUG
James J. Gietzen, Smithtown, N.Y., assignor to Dynamic Instrument Corporation, Hauppauge, N.Y.
Filed Oct. 24, 1975, Ser. No. 625,539
Term of patent 7 years
Int. Cl. D13—*03*
U.S. Cl. D13—28



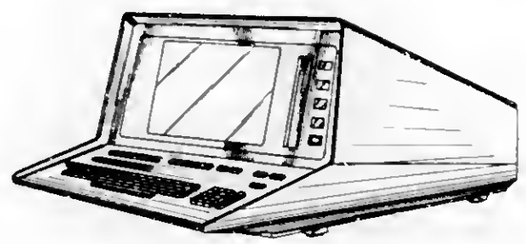
244,612
ELECTRICAL CONNECTOR RETAINING CLIP
Edgar Burns, Los Angeles, Calif., assignor to International Telephone and Telegraph Corporation, New York, N.Y.
Filed Jan. 12, 1976, Ser. No. 648,265
Term of patent 14 years
Int. Cl. D13—*03*
U.S. Cl. D13—24



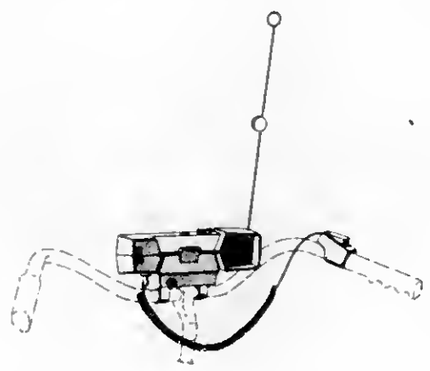
244,613
DESK-TOP ACCOUNTING TERMINAL
Ettore Sottsass, Jr., Milan, Italy, assignor to Ing. C. Olivetti & C., S.p.A., Ivrea (Turin), Italy
Filed Mar. 12, 1975, Ser. No. 557,738
Claims priority, application Italy, Sept. 18, 1974, 53457/74
Term of patent 14 years
Int. Cl. D18—*01*
U.S. Cl. D14—45

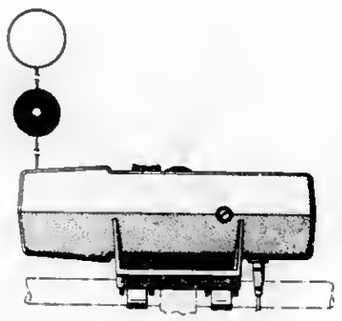


244,614
COMPUTING SYSTEM
Jack Arthur Gilmore, Aloha; Garry Mitchell Burgess, Beaverton; Sidney Hubert Broughton, Portland, and Martha Jane Rowland, Aloha, all of Oreg., assignors to Tektronix, Inc.
Filed Oct. 24, 1975, Ser. No. 625,610
Term of patent 14 years
Int. Cl. D14—*02*
U.S. Cl. D14—43

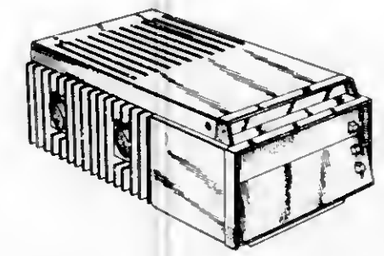


244,615
BICYCLE MOUNTED TRANSCEIVER
James F. Mariol, Cincinnati, Ohio, assignor to Wood, Herron & Evans, Cincinnati, Ohio
Filed Sept. 29, 1975, Ser. No. 617,785
Term of patent 14 years
Int. Cl. D14—*03*; D8—*08*
U.S. Cl. D14—68

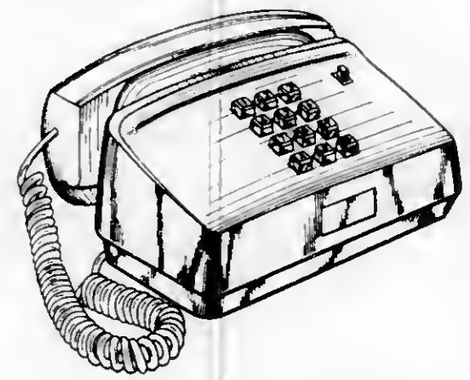


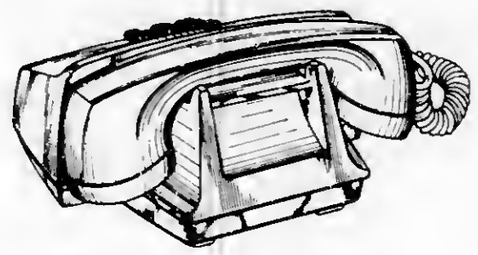


244,616
POWER AMPLIFIER
Stuart Walter Sizer, Harbert, Mich., assignor to Heath Company, Benton Harbor, Mich.
Filed Oct. 28, 1975, Ser. No. 626,506
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—96

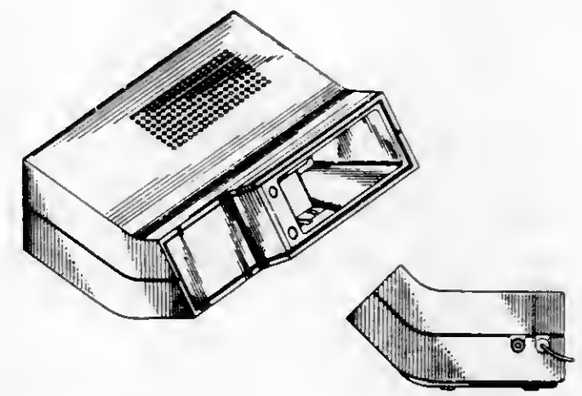


244,617
TELEPHONE INSTRUMENT
Carl-Arne Breger, Stockholm, Sweden, assignor to Telefonaktiebolaget L M Ericsson, Stockholm, Sweden
Filed Mar. 22, 1976, Ser. No. 669,329
Claims priority, application Sweden, Sept. 24, 1975, 75.1867
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—53



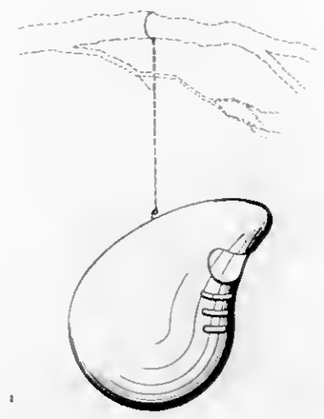


244,618
COMBINATION BATTERY CHARGER, RECEIVER AND AMPLIFIER OR SIMILAR ARTICLE
Arnold Sherwin Goldman, Plantation, and Richard John Toth, Oakland Park, both of Fla., assignors to Motorola, Inc., Schaumburg, Ill.
Filed Mar. 8, 1976, Ser. No. 664,854
Term of patent 14 years
Int. Cl. D13—*02*; D14—*03*
U.S. Cl. D13—5

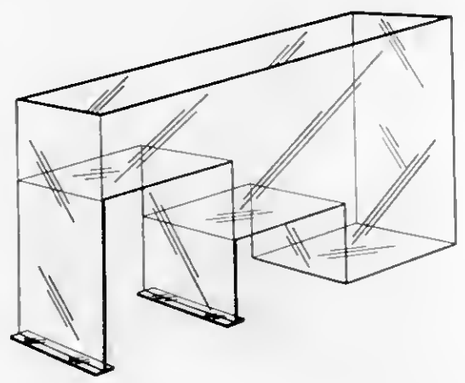


244,619
LIGHTER FOR SMOKERS
Guy Neyret, Francheville, France, assignor to Interfeudor S.A., Geneva, Switzerland
Filed Oct. 14, 1975, Ser. No. 622,180
Claims priority, application France, Apr. 24, 1975, 75.73813
Term of patent 14 years
Int. Cl. D27—*05*
U.S. Cl. D27—36

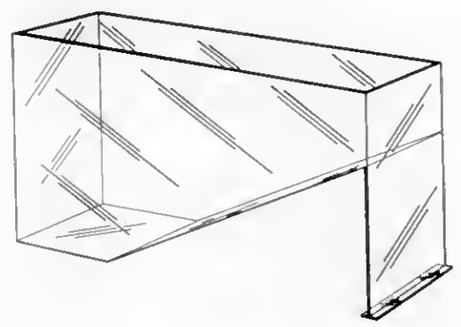
244,620
HANGING BIRDHOUSE
Patrick J. Cudmore, Duxbury, Mass., assignor to Wave-Rider, Incorporated, Duxbury, Mass.
Filed Dec. 29, 1975, Ser. No. 645,313
Term of patent 14 years
Int. Cl. D30—*03*
U.S. Cl. D30—3



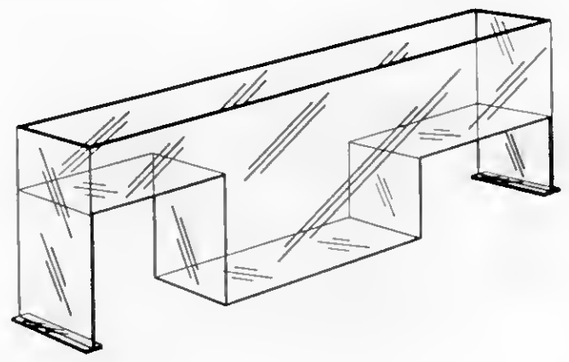
244,621
AQUARIUM
Malcolm R. Braid, 1005 Cumberland Drive, Auburn, Ala. 36830
Division of Ser. No. 408,157, Oct. 19, 1973. This application Nov. 3, 1975, Ser. No. 628,155, Pat. No. D238,687
Term of patent 14 years
Int. Cl. D30—*02*
U.S. Cl. D30—6



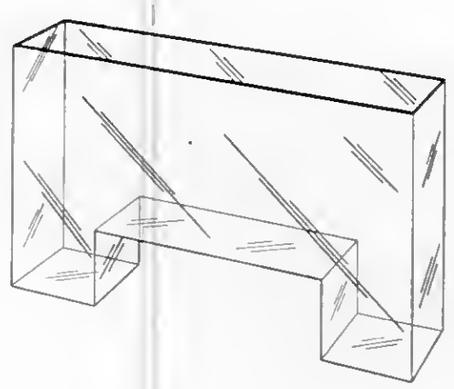
244,622
AQUARIUM
Malcolm R. Braid, 1005 Cumberland Drive, Auburn, Ala. 36830
Division of Ser. No. 408,157, Oct. 19, 1973, Pat. No. D238,687. This application Nov. 3, 1975, Ser. No. 628,156
Term of patent 14 years
Int. Cl. D30—*02*
U.S. Cl. D30—6



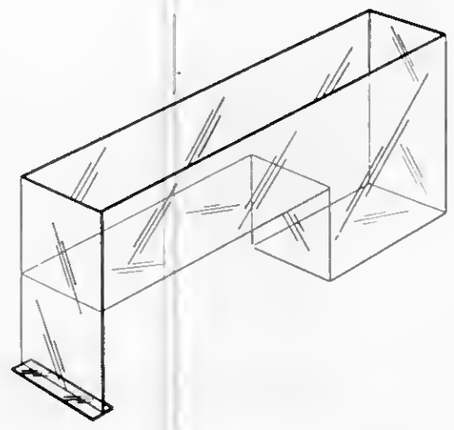
244,623
AQUARIUM
Malcolm R. Braid, 1005 Cumberland Drive, Auburn, Ala. 36830
Division of Ser. No. 408,157, Oct. 19, 1973, Pat. No. D238,687. This application Nov. 3, 1975, Ser. No. 628,157
Term of patent 14 years
Int. Cl. D30—*02*
U.S. Cl. D30—6



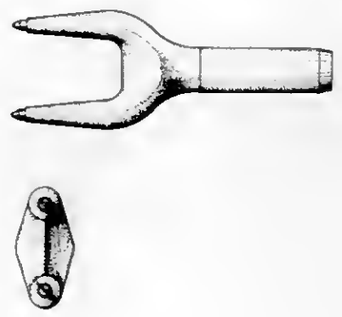
244,624
AQUARIUM
Malcolm R. Braid, 1005 Cumberland Drive, Auburn, Ala. 36830
Division of Ser. No. 408,157, Oct. 19, 1973, Pat. No. D238,687. This application Nov. 3, 1975, Ser. No. 628,364
Term of patent 14 years
Int. Cl. D30—*02*
U.S. Cl. D30—6



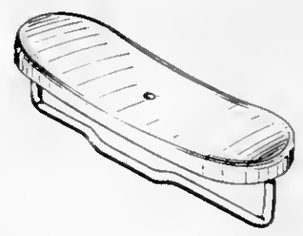
244,625
AQUARIUM
Malcolm R. Braid, 1005 Cumberland Drive, Auburn, Ala. 36830
Division of Ser. No. 408,157, Oct. 19, 1973. This application Nov. 3, 1975, Ser. No. 628,365, Pat. No. D238,687
Term of patent 14 years
Int. Cl. D30—*02*
U.S. Cl. D30—6



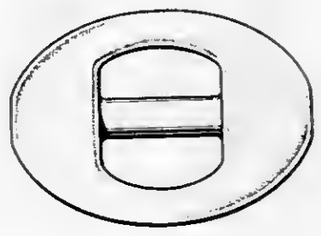
244,626
HEAD FOR A CATTLE PROD OR SIMILAR ARTICLE
James S. Andrews, Westminister, Colo., assignor to The Magrath Company, McCook, Nebr.
Filed June 3, 1976, Ser. No. 692,567
Term of patent 14 years
Int. Cl. D30—*05*
U.S. Cl. D30—32



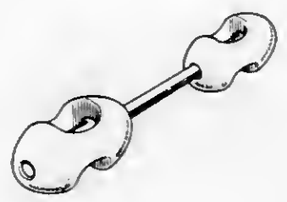
244,627
PLAYGROUND SEAT
Vernon L. Ryan, 6802 Millikin Ave., Austin, Tex. 78723
Filed Oct. 3, 1975, Ser. No. 619,250
Term of patent 14 years
Int. Cl. D21—*03*
U.S. Cl. D34—5 L



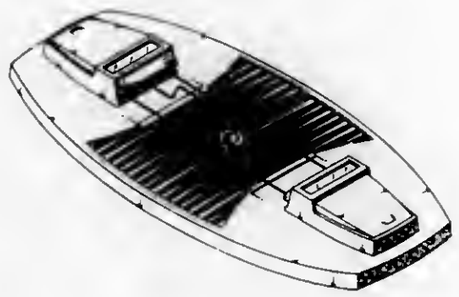
244,628
DUMBBELL
Forrest S. Wright, 2821 Patrick Henry Drive, Apt. 307, Auburn Heights, Mich. 48507
Filed Oct. 24, 1975, Ser. No. 625,440
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 K



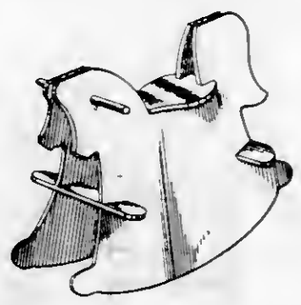
244,629
BARBELL
Forrest S. Wright, 2821 Patrick Henry Drive, Apt. 307, Auburn Heights, Mich. 48507
Filed Oct. 24, 1975, Ser. No. 625,442
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 K



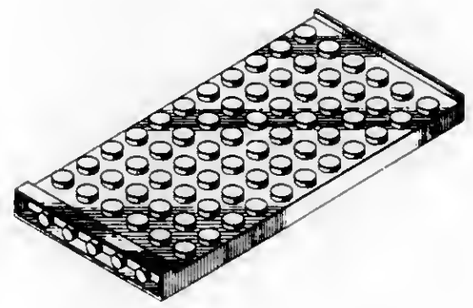
244,630
GOLF CLUB SWING MONITOR
Alois Krawagna, Toronto, Canada, assignor to Ian R. Campbell, Islington, Canada
Filed Jan. 28, 1976, Ser. No. 653,159
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 CB



244,631
ROCKING TOY
Eric Kyte, Ilkley, England, assignor to Bulldog Toy Company Limited, Leeds, England
Filed Dec. 11, 1975, Ser. No. 639,733
Claims priority, application United Kingdom, June 12, 1975, 971459/75
Term of patent 14 years
Int. Cl. D21—*01*
U.S. Cl. D34—15 AE

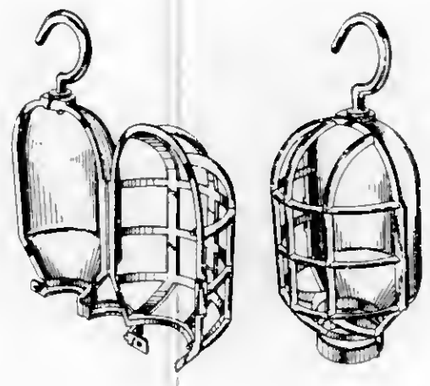


244,632
TOY CONSTRUCTION PIECE
Godtfred Kirk Christiansen, Billund, Denmark, assignor to Interlego A.G., Zug, Switzerland
Filed Sept. 16, 1975, Ser. No. 613,743
Claims priority, application Denmark, Mar. 25, 1975, 253/75
Term of patent 3½ years
Int. Cl. D21—*01*
U.S. Cl. D34—15 GG

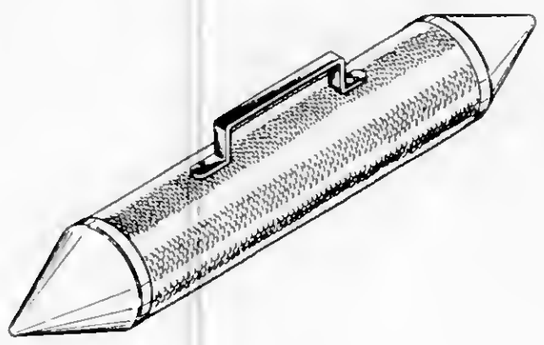


244,633
CANDLE CUP
Robert F. Ball, 2010 Richards Road, Willow Grove, Pa. 19090
Filed Dec. 22, 1975, Ser. No. 643,365
The portion of the term of this patent subsequent to Apr. 8, 1989, has been disclaimed.
Term of patent 14 years
Int. Cl. D26—*01*
U.S. Cl. D48—2

244,634
LAMP GUARD
Bernard J. Tamarin, Philadelphia, Pa., assignor to The Vacuum Cleaner Corporation of America
Filed Dec. 15, 1975, Ser. No. 640,539
Term of patent 14 years
Int. Cl. D26—*02*
U.S. Cl. D48—16 B

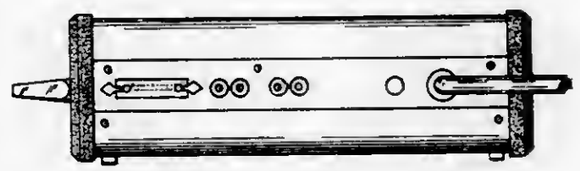


244,635
COMBINED GUIRO AND SHAKER
Martin B. Cohen, 68 Saddlewood Drive, Hillsdale, N.J. 07642
Continuation-in-part of Ser. No. 482,047, June 24, 1974, abandoned. This application Oct. 30, 1975, Ser. No. 627,404
Term of patent 14 years
Int. Cl. D17—*04*
U.S. Cl. D56—1 E



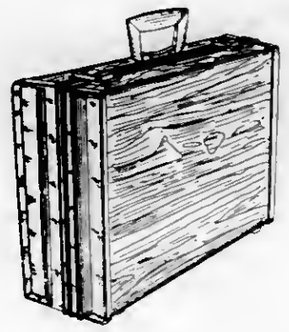
244,636
BASS DRUM STABILIZER OR SIMILAR ARTICLE
Joseph G. Cocuzzo, 84 D Marion Pepe Drive, Lodi, N.J. 07644
Filed Nov. 6, 1975, Ser. No. 629,666
Term of patent 14 years
Int. Cl. D17—*99*
U.S. Cl. D56—1 E

244,637
PULMONARY FUNCTION TESTER COMPUTER
Bernard N. Gray, East Pepperell, Mass., assignor to Life Support Equipment Corporation, Woburn, Mass.
Filed Sept. 13, 1976, Ser. No. 723,048
Term of patent 14 years
Int. Cl. D24—*01*
U.S. Cl. D24—17

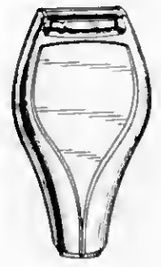


244,638
TOTE BAG
John A. Artmann, Denver, Colo., and Thomas D. Tweedie, Monrovia, Calif., assignors to Samsonite Corporation, Denver, Colo.
Filed Mar. 21, 1975, Ser. No. 560,335
Term of patent 14 years
Int. Cl. D3—*01*
U.S. Cl. D87—3 F

244,639
CARRYING CASE
Kurt D. Greenbaum, New York, N.Y., assignor to Ikelheimer-Ernst, Inc., New York, N.Y.
Filed Aug. 14, 1975, Ser. No. 604,577
Term of patent 14 years
Int. Cl. D3—*01*
U.S. Cl. D87—5 F



244,640
ELECTRIC SHAVER
Douglas George Long, Lombard, Ill., assignor to Sunbeam Corporation, Chicago, Ill.
Filed Jan. 29, 1976, Ser. No. 653,438
Term of patent 14 years
Int. Cl. D28—*03*
U.S. Cl. D28—51



LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 7TH DAY OF JUNE, 1977

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

A B Kabi: *See—*
Aurell, Leif Erik; and Claeson, Karl Goran, 4,028,318.
Aaltonen, Olavi August; Talonen, Timo Tapani; and Harkki, Seppo Untamo, to Outokumpu Oy. Suspension smelting furnace for finely-divided sulfide and/or oxidic ores or concentrates. 4,027,863, Cl. 266-162.000.
AB Bofors: *See—*
Gustavsson, Varne Axel Gerhard; and Moberg, Lars-Goran, 4,027,758.
Lundin, Lars Olof, 4,027,738.
AB Volvo Penta: *See—*
Schlicker, Heinrich August, 4,027,922.
Abel, Martin L., to Permalock Company, Inc. Method and apparatus for moving and guiding wires. 4,028,157, Cl. 156-72.000.
Abex Corporation: *See—*
Frank, Earl E.; and Yee, Bing S., 4,027,595.
Abrahams, Louis, to Waters Associates, Incorporated. Novel gasket and flow cell comprising same. 4,027,983, Cl. 356-246.000.
Abred Establishment: *See—*
Manzini, Ferruccio, 4,027,482.
Adachi, Kyoichi: *See—*
Jikihara, Kazuo; Iori, Shinichi; Kimura, Ichiro; and Adachi, Kyoichi, 4,028,091.
Adams, Thomas F. Pallet truck for use with fork lift truck. 4,027,771, Cl. 214-621.000.
Adelstein, Gilbert William, to G. D. Searle & Co. 2-Azabicyclo[2.2.2-.]octan-2-yl-diphenyl-alkanones and related compounds. 4,028,364, Cl. 260-293.540.
Adler, Franklin P.; and Pavolka, John D., to Pullman Incorporated. Pressure probe unloading device for pneumatic operated discharge gates. 4,027,921, Cl. 302-52.000.
Adler, Stanford L., to Technicon Instruments Corporation. Sample mixer and spreader. 4,027,623, Cl. 118-108.000.
Adolphi, Heinrich: *See—*
Zschocke, Albrecht; Kummer, Horst; and Adolphi, Heinrich, 4,028,399.
Advanced Power Systems: *See—*
Folsom, Lawrence R., 4,027,475.
AEG-Elotherm G.m.b.H.: *See—*
Matthes, Hans; and Mauler, Erhard, 4,028,608.
Aerojet-General Corporation: *See—*
Katzakian, Arthur, Jr.; and DePree, David O., 4,028,234.
Agence Nationale de Valorisation de la Recherche (ANVAR): *See—*
Julia, Marc, 4,028,422.
Sureau, Claude; Tournaire, Michel; Zorn, Jean-Rene; Sturbois, Gilbert; Chavinie, Jacques; Le Houezec, Roger; and Ripoche, Andre, 4,027,657.
AGFA-GEVAERT, N.V.: *See—*
Berendsen, Jules Robert; Pollet, Robert Joseph; Philippaerts, Herman Adelbert; Sels, Francis Jeanne; and Willems, Jozef Frans, 4,028,110.
Van Royen, Freddy Ghisleen, 4,028,108.
AGM Industries, Inc.: *See—*
Gentry, Charles B., 4,027,721.
Agriculture Research Incorporated: *See—*
Stone, G W (Charles), 4,027,464.
Agway, Inc.: *See—*
Talbert, Norwood K., 4,028,447.
Ahmed, Adel Abdel Aziz, to RCA Corporation. Current amplifiers. 4,028,631, Cl. 330-19.000.
Air Filters, Inc.: *See—*
Schaaf, Robert, 4,028,074.
Airco, Inc.: *See—*
Hunt, Charlea d'A., 4,027,722.
Aisin Seiki Kabushiki Kaisha: *See—*
Kondo, Toshiyuki, 4,027,924.
Murakami, Noboru; Hirosawa, Koichiro; Ohara, Kazuo; and Matsuo, Koichi, 4,027,551.
Murakami, Noboru; Hirosawa, Koichiro; Ohara, Kazuo; and Matsuo, Koichi, 4,027,552.
Akabane, Katsumi: *See—*
Yatsuo, Tsutomu; and Akabane, Katsumi, 4,028,721.
Akita, Sigeyuki: *See—*
Kitagawa, Junji; and Akita, Sigeyuki, 4,028,620.
Aktiebolaget Imo Industre: *See—*
Lonnebring, Arne, 4,028,025.
Aktiebolaget Karlstads Mekaniska Werkstad: *See—*
Myren, Harry Ingemar, 4,028,174.
Akzona Incorporated: *See—*
Panneman, Harm Jan; and Bruins, Antonius Hermanus Nicolaas Maria, 4,028,380.
Alaimo, Robert James: *See—*
Pelosi, Stanford Salvatore, Jr.; and Alaimo, Robert James, 4,028,374.
Albanese, Angelo P.; and Rattiner, David H., to Sperry Rand Corporation. Adaptive signal processor for clutter elimination. 4,028,697, Cl. 343-5.00R.
Alberts, Heinrich: *See—*
Prinz, Richard; Elghani, Salah Elabd; Fischer, Winfried; and Alberts, Heinrich, 4,028,433.
Alcalde Cilveti, Francisco-Javier. System for constructing spatial structures. 4,027,449, Cl. 52-648.000.
Alessio, Lorenzo Ercole, to Black and Decker Manufacturing Company, The. Speed changing device for tools having a gear assembly with a variable gear ratio. 4,027,546, Cl. 74-325.000.
Alexander, Ernest John; and Mooradian, Aram, to Sterling Drug Inc. 9-Benzoyl,3-hydrozymethyl-1,2,3,4-tetrahydro-carbazole. 4,028,382, Cl. 260-315.000.
Alexandre, Philippe, to Societe Generale de Constructions Electriques et Mecaniques (Alathom). Method for adjusting an automatic sluice with a view to ensuring a determined level. 4,027,487, Cl. 61-25.000.
Alfonso Berbegal, Jose Luis. Articulation device for gunstocks of long firearms. 4,027,416, Cl. 42-73.000.
Alig, Leo; Furst, Andor; Keller, Peter; Muller, Marcel; Kerb, Ulrich; and Wiechert, Rudolf. D-homosteroids. 4,028,400, Cl. 260-488.00B.
Allan, John L., to Dart Industries Inc. Treatment of municipal waste sludges. 4,028,238, Cl. 210-53.000.
Allard, Frederick C., to United States of America, Navy. Inertial optical stabilizer. 4,027,540, Cl. 74-5.100.
Allegheny Ludlum Industries, Inc.: *See—*
Reen, Orville W.; and McMahon, Donald J., 4,028,094.
Allen & Hanburys Limited: *See—*
Bays, David Edmund; and Foster, Roy Vivian, 4,028,404.
Allen, John Glyn: *See—*
Francis, Robert John; and Allen, John Glyn, 4,028,363.
Allen, Robert K., to Marvin Glass & Associates. Wheeled vehicle construction kit. 4,027,421, Cl. 46-17.000.
Allen, Walter E., to Peter Paul Electronics Co., Inc. Solenoid valve. 4,027,850, Cl. 251-141.000.
Allenthorp, Douglas L.; and Galleber, Michael L. Minicamper. 4,027,739, Cl. 180-89.100.
Alliance Machine Company, The: *See—*
Polen, Karl L., 4,027,800.
Allied Chemical Corporation: *See—*
Stephenson, Robert Larry; and Colasanti, Arduino, 4,027,829.
Allis-Chalmers Corporation: *See—*
Cozhill, Major, 4,027,825.
Allis, Robert F.: *See—*
Hoppner, Werner F.; Spinelli, Richard A.; and Allis, Robert F., 4,027,963.
Alps Motorola, Inc.: *See—*
Miyazaki, Toru, 4,028,735.
Alter S.A.: *See—*
Sunkel Letelier, Carlos; and Cillero Grafulla, Fernando, 4,028,369.
Aluminium Norf GmbH: *See—*
Braun, Walter; and Hoffmann, Gunter, 4,028,072.
Aluminum Company of America: *See—*
Bennett, Robert F.; Brouwer, Nicholaas L.; and Stricker, David M., 4,027,527.
Alway, Peter: *See—*
Bud, Hans; and Alway, Peter, 4,028,530.
Amano, Masuo, to Toyota Jidosha Kogyo Kabushiki Kaisha. Isothermal fuel supply system. 4,027,639, Cl. 123-122.00E.
Ambac Industries, Inc.: *See—*
Nelson, David M., 4,028,057.
Ambridge, Thomas: *See—*
Faktor, Marc Marian; Ambridge, Thomas; and Bremner, Ean Grant, 4,028,207.
Ambrosiano, Nicholas A.: *See—*
Crounse, Nathan N.; and Ambrosiano, Nicholas A., 4,028,372.
Amerace Corporation: *See—*
Loft, John T., 4,028,250.
Mazzeo, Charles F., 4,027,940.
American Air Filter Company, Inc.: *See—*
Kannapell, David H., 4,027,654.
American Cyanamid Company: *See—*
Gustafson, William Roy, 4,028,227.
Li, Tsi Tieh; and Sazon, Robert, 4,028,305.
Schaub, Robert Eugene; and Weiss, Martin Joseph, 4,028,396.
American Hospital Supply Corporation: *See—*
Johnston, Donald Leroy; Perkins, Manuel Garfield; and Youngberg, Lynn Zaugg, 4,027,669.

Mueller, Floyd F., 4,027,600.
American Magnetics Corporation: *See—*
Mos, Robert J., 4,028,734.
American Optical Corporation: *See—*
Gottlieb, Nathan, 4,027,944.
Krohn, David A.; Grolman, Bernard; and Siegmund, Walter P., 4,028,082.
American Radionic Co., Inc.: *See—*
Stockman, Robert M., 4,028,595.
Ammann, Paul R.; Cook, Glenn M.; and Portal, Charles, to Kennecott Copper Corporation. Direct electrochemical recovery of copper from dilute ammoniacal solutions. 4,028,202, Cl. 204-106.000.
Amon, Georg, to Jenoptik Jena G.m.b.H. Optical interferometer. 4,027,976, Cl. 356-106.00R.
Amort, Jurgen; and Nestler, Heinz, to Dynamit Nobel Aktiengesellschaft. Organofunctional silicon compounds as adhesivizers for organic binding agents. 4,028,343, Cl. 260-59.00R.
AMP Incorporated: *See—*
Asick, John Carl, 4,027,368.
Kahn, David; and Peiffer, Howard Richard, 4,028,591.
Anderl, Peter; Geffcken, Monika; and Geissler, Joachim, to Steigerwald Strahltechnik GmbH. Energy-beam engraving method and an apparatus for carrying it out. 4,028,523, Cl. 219-121.0EM.
Anderson, Arnold L., to Velsicol Chemical Corporation. Plastic compositions. 4,028,336, Cl. 260-45.75R.
Anderson, Charles Hammond; and Bloom, Stanley, to RCA Corporation. Guided beam flat display device. 4,028,582, Cl. 313-422.000.
Anderson, Donald; and Anderson, Kaye. Sun shield assembly for detachable attachment to infant's seat. 4,027,915, Cl. 297-184.000.
Anderson, Kaye: *See—*
Anderson, Donald; and Anderson, Kaye, 4,027,915.
Andersson, Leif; and Singh, Ritindar, to Stal-Laval Turbin AB. Fluid distribution valve. 4,027,699, Cl. 137-625.370.
Andrews, Stephen W.: *See—*
Ellis, Franklin H.; and Andrews, Stephen W., 4,027,393.
Andros Incorporated: *See—*

Blosam, James M. Portable automotive test probe. 4,028,621, Cl. 324-51.000.

Blue Bird Body Company (Entire): *See—*
Moormen, James H., Jr., 4,027,747.

Bocion, Pierre; De Silva, Wijitha; and Winternitz, Pavol, to Hoffmann-La Roche Inc. Plant growth influencers. 4,028,089, Cl. 71-88.000.

Bodanszky, Miklos; and Shechen, John Timothy, to E. R. Squibb & Sons, Inc. Solid phase synthesis of peptides. 4,028,315, Cl. 260-78.00A.

Bodensieck, Ernest J., to Garrett Corporation, The. Bearing assembly and method. 4,027,930, Cl. 308-202.000.

Bodner, Ernest Robert. Method and apparatus for embossing sheet metal strip and sheet metal panel. 4,027,517, Cl. 72-177.000.

Bodor, Nicolae S.; and Yuan, Sun-Shine, to Interx Research Corporation. Novel intermediates useful in the synthesis of optically active m-acyloxy-α-[(methylamino)methyl]benzyl alcohols. 4,028,368, Cl. 260-295.00R.

Bodtmann, William Fred; and Ruthroff, Clyde Leslie, to Bell Telephone Laboratories, Incorporated. Linear phase modulator including a pair of Armstrong modulators. 4,028,641, Cl. 332-18.000.

Bogan, Richard T.; and Shelton, Claude M., to Eastman Kodak Company. Melt phase process for the preparation of emulsifiable polyethylene waxes. 4,028,436, Cl. 260-878.00R.

Bohlin, Karl Gunnar; Eriksson, Karl Rune; and Gustafsson, Carl-Erik, to SCA Development Aktiebolag. Load-weighing device. 4,027,736, Cl. 177-147.000.

Bohner, Beat: *See—*
Meyer, Willy; Bohner, Beat; Dawes, Dag; and Rufenacht, Kurt, 4,028,377.

Bolex International SA: *See—*
Reichen, Willi; and Aste, Robert, 4,027,955.

Bolto, Brian Alfred; and Eldridge, Robert James, to ICI Australia Limited; and Commonwealth Scientific and Industrial Research Organization. Preparation of polymer composites. 4,028,255, Cl. 210-500.00R.

Bonaddio, Robert M., to PPG Industries, Inc. Force applying device for scoring wheels. 4,027,562, Cl. 83-8.000.

Bond, William C., Jr.; and Wahlborg, Harold J., to Copolymer Rubber & Chemical Corporation. EPDM interpolymers formed with unsaturated organosilanes. 4,028,483, Cl. 526-279.000.

Bondar, Martin Moses: *See—*
Frech, Roger Alvan; and Bondar, Martin Moses, 4,027,870.

Bonney, Roland W. Rotary valve. 4,027,697, Cl. 137-596.000.

Bonnice, Phillip E., to General Electric Company. Grinding wheel dressing method. 4,027,648, Cl. 125-11.00R.

Booth, Inc.: *See—*
Branch, William C.; Cole, Oliver W.; and Kidd, Robert P., 4,027,783.

Border, Gary Clayton: *See—*
Patznick, Richard Arthur; and Border, Gary Clayton, 4,028,083.

Borejko, Stefan: *See—*
Stiller, Armin; and Borejko, Stefan, 4,028,613.

Borg-Warner Corporation: *See—*
Dockus, Kostas F., 4,028,200.
Radke, Edmund John; and Bair, Joseph Louis, 4,027,757.

Borkowski, Walter L.; and Schneider, Abraham, to Suntech, Inc. Explosive composition containing high density hydrocarbon liquid. 4,028,152, Cl. 149-46.000.

Borror, Alan L., to Polaroid Corporation. Novel chemical compounds. 4,028,353, Cl. 260-240.600.

Borvendeg, Janos: *See—*
Bite, Pal; Moravcsik, Imre; Schafer, Inge; Horvath, Gyula; Mehesfalvi nee Vajna, Zsuzsanna; Borvendeg, Janos; and Hermann nee Szente, Ilona, 4,028,348.

Boudouris, Georges; Kalopissis, Gregoire; Leveque, Jean-Luc; and Roussopoulos, Paul, to L'Oreal. Device for superficially heating an adjacent body. 4,028,518, Cl. 219-10.810.

Boutaille, Daniel; Hardouin, Pierre; and Thomasse, Andre, to La Telemecanique Electrique. System allowing the realization of logic circuits by juxtaposition of pneumatic elements. 4,027,692, Cl. 137-270.000.

Bowen Tools, Inc.: *See—*
Slator, Damon T.; Bishop, Thomas R.; and Peil, Archie W., 4,027,816.

Bowen, Woodrow L.; and Moore, Harlan D. Silver recovery apparatus. 4,028,212, Cl. 204-272.000.

Boyd, David M., to UOP Inc. Systematized method and control of fractionation heat balance. 4,028,194, Cl. 203-2.000.

Boylan, John R.: *See—*
Shufflebarger, Earl D.; Kish, Edward E.; Boylan, John R.; Diehl, George D.; Gallagher, Bernard J.; and Tobbe, William P., 4,028,254.

BP Trading Limited: *See—*
Armstrong, Robert James; and Cook, Boyd Stanley, 4,027,399.

Bram, Georges Eugene, to Pont-A-Mousson S.A. Device for a tensile locking of pipe elements. 4,027,904, Cl. 285-297.000.

Branch, William C.; Cole, Oliver W.; and Kidd, Robert P., to Booth, Inc. Tallying beverage dispenser. 4,027,783, Cl. 222-26.000.

Brandenstein, Manfred: *See—*
Kunkel, Heinrich; Brandenstein, Manfred; Olschewski, Armin; Finzel, Sigismund; Gossmann, Willi; and Horling, Peter, 4,027,932.

Branson Ultrasonics Corporation: *See—*
Bachar, John J., 4,027,370.
Bryant, Ronald K., 4,028,033.

Brant, Robert D., to Palmer Paint Products, Inc. Paint set and teaching aid. 4,027,404, Cl. 35-28.500.

Braukmann, Bernhard W. Valve disc and seat construction. 4,027,852, Cl. 251-333.000.

Braun, Walter; and Hoffmann, Gunter, to Aluminium Norf GmbH. Apparatus for scrubbing of hydrocarbons from gas. 4,028,072, Cl. 55-195.000.

Brehm, Gustav, to Heberlein Maschinenfabrik AG. Process for continuously treating thermoplastic yarns. 4,027,466, Cl. 57-34.0HS.

Bremner, Ean Grant: *See—*
Faktor, Marc Marian; Ambridge, Thomas; and Bremner, Ean Grant, 4,028,207.

Brennemann, Andrew Ernest; and Soo, Suk Suet, to International Business Machines Corporation. Call progress signal detector. 4,028,493, Cl. 179-2.0DP.

Breslau, Franklin Charles; and Goertzel, Gerald, to International Business Machines Corporation. Asynchronous, hierarchical loop communication system with independent local station control of access to inbound time portions without central control. 4,028,667, Cl. 340-172.500.

Breslow, Jeffrey D.; and Frumkin, Mitchell J., to Marvin Glass & Associates. Game device. 4,027,877, Cl. 273-1.00R.

Bretschneider, Edward S.: *See—*
Rubino, Andrew M.; Jones, John L.; and Bretschneider, Edward S., 4,028,390.

Breuer, Hermann; and Treuner, Uwe D., to E. R. Squibb & Sons, Inc. Alkenyl and alkinylureido cephalosporins. 4,028,354, Cl. 260-243.00C.

Bridge, Donald John Henry, to Finspa Engineering Co. Limited. Joint construction for connecting together two frame members. 4,027,453, Cl. 403-353.000.

Bridgestone Tire Company Limited: *See—*
Soto, Shigetake; Kurahashi, Suminobu; Okuyama, Toru; and Hamada, Noboru, 4,028,287.

Briggs, Robert L., to Aneomstat Products Division, Dynamics Corporation of America. Fire and impact resistant window assembly. 4,027,443, Cl. 52-202.000.

Bright, Gene Michael, to Pfizer Inc. 6-Acylamido-2,2-dimethyl-3-(pyrimidin-4,6-dione-2-yl)-penams and intermediates therefor. 4,028,360, Cl. 260-256.50R.

Brinkman, Earl W., to Davenport Machine Tool. Method for producing sparking wheels. 4,027,376, Cl. 29-417.000.

Bris, Herman Josef, to Girling Limited. Disc brakes for vehicles. 4,027,752, Cl. 188-73.600.

Bronner, Emanuel H. Contraceptive device. 4,027,670, Cl. 128-261.000.

Brooks & Perkins, Incorporated: *See—*
Roszler, John J., 4,027,377.

Brouwer, Nicholaas L.: *See—*
Bennett, Robert F.; Brouwer, Nicholaas L.; and Stricker, David M., 4,027,527.

Browder, Lewis B., to Bell & Howell Company. Provision and display of video signals. 4,028,729, Cl. 358-148.000.

Brown, Allen C.; Hattes, Neil R.; and Eyrick, Theodore B., to Chemetron Corporation. Humidifier and automatic control system therefor. 4,028,444, Cl. 261-122.000.

Brown, Claude V.: *See—*
Needham, Donald G.; Taylor, Kenneth P.; and Brown, Claude V., 4,028,332.

Brown, George L.; and Tobias, Michael A., to Mobil Oil Corporation. Epoxy modified acrylic latices and method of producing same. 4,028,294, Cl. 260-29.6NR.

Brown, Leonard A.: *See—*
Barto, Robert W.; and Brown, Leonard A., 4,027,499.

Brown, Richard E.; and Unangst, Paul C., to Warner-Lambert Company. Indolopyrones having antiallergic activity. 4,028,383, Cl. 260-326.290.

Brown, William F., to Vast Products Inc. Foamed polyester resin. 4,028,289, Cl. 260-2.50N.

Brownell, Lloyd E.: *See—*
Barney, Gary S.; and Brownell, Lloyd E., 4,028,265.

Brownstein, Arthur M.; and Kerr, David L., to Sun Oil Company. Oxidation of aliphatic and alicyclic hydrocarbons. 4,028,423, Cl. 260-610.00B.

Brubaker, Burton D.: *See—*
Cheng, Chin Huan; and Brubaker, Burton D., 4,027,379.

Brucker, Ben B. Hockey glove with improved palm construction. 4,027,339, Cl. 2-16.000.

Brugman, Johannes Antonius Henricus, to Hunter Douglas International N.V. Suspended screen ceiling. 4,027,446, Cl. 52-484.000.

Bruhl, Peter. Device for chill-drying a gas. 4,027,729, Cl. 165-111.000.

Bruins, Antonius Hermanus Nicolaas Maria: *See—*
Panneman, Harm Jan; and Bruins, Antonius Hermanus Nicolaas Maria, 4,028,380.

Brunet, Henry, to Compagnie Generale d'Electricite. Vibration energy transfer laser. 4,028,635, Cl. 331-94.50G.

Brunswick Corporation: *See—*
Rauchle, Roy J.; and Vandenberg, John L., 4,027,555.

Bryans, Alexander Connor, to General Electric Company. Diffuser for a centrifugal compressor. 4,027,997, Cl. 415-207.000.

Bryant, Ronald K., to Branson Ultrasonics Corporation. Apparatus for embossing a plastic workpiece using vibratory energy. 4,028,033, Cl. 425-183.000.

Buchi, George H.; and Wuest, Hans, to Firmenich S.A. Cycloaliphatic unsaturated ketones as fragrance modifying agents. 4,028,278, Cl. 252-522.000.

Buckholtz, Theonda N., Jr. Novelty item. 4,027,874, Cl. 272-1.00R.

Buckley, David A.; and Belli, Frank G., to Xerox Corporation. Migration imaging member employing a surface skin. 4,028,101, Cl. 96-1.500.

Buckley, Norman Ian; and Wilson, Edward, to Shorrock Developments Limited. Intruder detection device. 4,028,690, Cl. 340-258.00B.

Bucyrus-Erie Company: *See—*
Johnston, Roger L.; and Wiencek, Daniel C., 4,027,801.

Bud, Hans; and Alway, Peter, to Bud, Hans. Counting devices. 4,028,530, Cl. 235-144.0HC.

Bueker, Robert A., to Direct Image Corporation. Sheet separation device. 4,027,872, Cl. 271-170.000.

Buffenbarger, John K.: *See—*
Ward, Donald H.; and Buffenbarger, John K., 4,027,611.

Bujas, Roko, to Commissariat a l'Energie Atomique. Method and device for the fabrication of nuclear fuel compacts. 4,028,446, Cl. 264-.500.

Bullard, Robert G.; Plunkett, James P.; and Linning, George F., to Coils, Inc. Battery charger. 4,028,654, Cl. 336-92.000.

Bumgardner, Jon H. Optical frequency processor. 4,027,974, Cl. 356-74.000.

Bundy, Gordon L., to Upjohn Company, The. 9α,11oor 11o,9αEpoxymethano-prostaglandans and process for their preparation. 4,028,350, Cl. 260-240.00R.

Burdette, George W.; and Couch, Dean H., to United States of America, Navy. Low viscosity-high flash point ramjet and turbojet fuels. 4,028,066, Cl. 44-80.000.

Burge, William G. Theft-prevention screw fastenings. 4,027,572, Cl. 85-32.00R.

Burlington Industries, Inc.: *See—*
Sanderson, William A., 4,028,403.

Burpee, Louis W. Detachable windshield wiper assembly for helmet. 4,027,354, Cl. 15-250.300.

Burroughs Corporation: *See—*
Neri, Joseph Dominic; and Williams, John Lewis, 4,028,286.

Burton, Robert S., III: *See—*
Bartel, William J.; and Burton, Robert S., III, 4,027,917.

Buskine S.A.: *See—*
Taccone, Ida, 4,028,351.

Bustin, Leopold. Free flow grating. 4,027,451, Cl. 52-664.000.

Butcher, Alan George, to Dresser Europe S. A. Control valve. 4,027,694, Cl. 137-495.000.

Butler, James G.: *See—*
Butler, Robert M.; Butler, John T.; and Butler, James G., 4,027,628.

Butler, John T.: *See—*
Butler, Robert M.; Butler, John T.; and Butler, James G., 4,027,628.

Butler, Robert M.; Butler, John T.; and Butler, James G. Automatic feeding system for gestating livestock. 4,027,628, Cl. 119-52.00B.

Byrnes, Herbert P.; and Wahl, Richard, to International Business Machines Corporation. Contact for an electrical contactor assembly. 4,027,935, Cl. 339-48.000.

Byrum, Bernard W., Jr.; Fein, Michael E.; and Ernsthausen, Roger E., to Owens-Illinois, Inc. Gas discharge dielectric containing a source of boron, gallium, indium, or thallium. 4,028,578, Cl. 313-221.000.

C. Reichert Optische Werke AG: *See—*
Steinbatz, Alfred, 4,027,981.

C. Terrot Sobne, Firma: *See—*
Bitzer, Hans Eugen, 4,027,506.

Cabiro, Jorge Canals: *See—*
Jarque, Ricardo Granados; Cartes, Juan Bosch; Cabiro, Jorge Canals; Roldan, Cristobal Martinez; and Peinado, Rabadan, 4,028,371.

Cachier, Gerard; and Puron, Jean Paul, to Thomson-CSF. High-speed, low consumption integrated logic circuit. 4,028,556, Cl. 307-205.000.

Cadillac Rubber & Plastics, Inc.: *See—*
Dukes, Glenn V.; and Stroh, Thomas L., 4,027,813.

CAE Machinery Ltd.: *See—*
Weavell, Jack, 4,027,563.

Caldecott, Ross: *See—*
Young, Jonathan D.; and Caldecott, Ross, 4,028,707.

Camillucci, Edward R.: *See—*
Spinosa, Dominic J.; and Camillucci, Edward R., 4,027,386.

Campagnie des Brevets et Applications Industrielles Etablissement: *See—*
Romanin, Bruno, 4,027,704.

Campagnuolo, Carl J.; Smith, Earl T.; and Dale, Ronald L., to United States of America, Army. Multi-directional system for electrical bomb fuzes. 4,027,593, Cl. 102-70.20G.

Campbell, Robert W.: *See—*
Kleinschmidt, Roger F.; and Campbell, Robert W., 4,028,476.

Canadian Occidental Petroleum, Ltd.: *See—*

Diesner, Ferdinand, to Jakob Muller, Forschungs-und Finanz AG. Shuttleless weaving machine, especially ribbon loom. 4,027,703, Cl. 139-431.000.

Dietschy, Robert; and Hesel, Georges. Stitch presser for knitting machine. 4,027,504, Cl. 66-64.000.

Dikman, Robert J. Paper thrower. 4,027,780, Cl. 221-7.000.

Direct Image Corporation: *See—*
Bucker, Robert A., 4,027,872.

Director-General of the Agency of Industrial Science and Technology: *See—*
Okada, Akira; Iriyama, Keiji; and Shiraki, Masaru, 4,028,217.

Dischinger, Gebhard, to Babolat-Maillot-Witt; and Lipa Lizenz-und Patentverwertungs-ansalt. Device for the insertion of an intermediate member between two crossing strings of a tennis racquet. 4,027,371, Cl. 29-811.000.

Divine, Charles Hamman, to Bell Telephone Laboratories, Incorporated. Memory patching circuit with increased capability. 4,028,679, Cl. 340-172.500.

Divine, Charles Hamman; and O'Neill, John Francis, to Bell Telephone Laboratories, Incorporated. Memory patching circuit with counter. 4,028,683, Cl. 340-172.500.

Divine, Charles Hamman; and Moran, John Christian, to Bell Telephone Laboratories, Incorporated. Memory patching circuit with repatching capability. 4,028,684, Cl. 340-172.500.

Di Vita, Sam; and Vig, John R., to United States of America, Army. Method of treating optical waveguide fibers. 4,028,080, Cl. 65-2.000.

Dixon, Guy E.; Dixon, Thomas M.; and Geyer, Russell I., Jr., to Panelfold Doors, Inc. Hinge strip for dual wall accordion folding door. 4,027,714, Cl. 160-84.00R.

Dixon, Thomas M.: *See—*
Dixon, Guy E.; Dixon, Thomas M.; and Geyer, Russell I., Jr., 4,027,714.

Dockus, Kostas F., to Borg-Warner Corporation. Plating baths for depositing cobalt-lead nickel-lead alloys or combinations thereof and method of coating aluminum articles therewith. 4,028,200, Cl. 204-43.00T.

Dr. Kuhn & Co. GmbH: *See—*
Sickel, Helmut, deceased, 4,028,492.

Dr. Th. Wieland, Firma: *See—*
Strunz, Alfred; and Rohrer, Jurgen, 4,028,047.

Dodds, Andrew D.: *See—*
Krofchalk, Gary F.; and Dodds, Andrew D., 4,027,889.

Doi, Hachiro: *See—*
Takahashi, Katsuhiko; and Doi, Hachiro, 4,027,463.

Doi, Tsunesuke; Komoto, Hiroshi; Chono, Masazumi; Inoue, Akira; Saito, Kazuaki; and Shinozuka, Isao, to Asahi Kasei Kogyo Kabushiki Kaisha. Anti-corrosive agent for metals. 4,028,055, Cl. 21-2.70R.

Dolan, Thomas Albert, to Du Pont de Nemours, E. I., and Company. Yarn support. 4,027,830, Cl. 242-118.320.

Dolle, Alvin J. Security lock for trunk mounted antenna. 4,028,706, Cl. 343-715.000.

Domer, Michel: *See—*
Hauraus, Pierre; and Domer, Michel, 4,027,909.

Domic, Esteban; Sfeir, Albert; and Sandoval, Jorge, to Corporacion de Fomento de la Produccion, represented by Comite de Investigaciones Technologicas. Method of extraction involving the use of solvents and new combination of reactors used. 4,028,462, Cl. 423-24.000.

Domtar Limited: *See—*
Davey, Roger George, 4,028,457.

Donnell, James W. Estruded interior molding. 4,027,452, Cl. 52-716.000.

Dorsey, Geoffrey A., Jr., to Kaiser Aluminum & Chemical Corporation. Surface treatment of aluminum. 4,028,205, Cl. 204-181.000.

Dougherty, Earle T. Adjustably submersible breakwater. 4,027,486, Cl. 61-5.000.

Dougherty, Lawrence W., to Zenith Radio Corporation. Shadow mask mount and funnel-faceplate referencing system for color CRT. 4,028,580, Cl. 313-406.000.

Douglas, David, to Avon Products, Inc. Recloseable container. 4,027,776, Cl. 220-281.000.

Dow Chemical Company, The: *See—*
Ball, Clifford L.; and Smith, Harry A., 4,028,312.
Cheng, Chin Huan; and Brubaker, Burton D., 4,027,379.

Olstowski, Franciszek, 4,028,304.
Thompson, James L., 4,028,257.
Treat, Lyle G., 4,027,512.

Dowdle, James B., Jr., to United States of America, Army. Three phase spin motor power meter. 4,028,623, Cl. 324-142.000.

Dowty Meco Limited: *See—*
Lampl, Friedrich; and Paul, Thomas Campbell, 4,027,793.

Dowty Mining Equipment Limited: *See—*
Walker, John Hirst; Sutton, James Anthony; and Waters, John Henry, 4,027,489.

Draber, Wilfried: *See—*
Kramer, Wolfgang; Draber, Wilfried; Timmler, Helmut; and Forster, Heinz, 4,028,409.

Dragerwerk Aktiengesellschaft: *See—*
Hickmann, Karl; and Sahmkow, Dieter, 4,028,445.

Dresser Europe S. A.: *See—*
Butcher, Alan George, 4,027,694.

Driscoll, Gary L., to Sun Ventures, Inc. Additives to improve wettability of synthetic paper pulp. 4,028,452, Cl. 264-51.000.

Drudge, Forrest R. Force absorbing hitch for a vehicle. 4,027,893, Cl. 280-487.000.

Duckworth, Milton Donald, Jr. Aircraft lavatory drain plug. 4,027,701, Cl. 137-800.000.

Duke, Jimmy R.: *See—*
Miller, Walter E., Jr.; and Duke, Jimmy R., 4,027,837.

Duke, Marshall W., to United Merchants and Manufacturers, Inc. Fire retardent fabrics and method for preparation thereof. 4,028,053, Cl. 8-116.00P.

Dukes, Gleno V.; and Stroh, Thomas L., to Cadillac Rubber & Plastics, Inc. Tube separator. 4,027,813, Cl. 225-97.000.

Dumoulin, Jean; and Nicou, Parasko, to Rhone-Poulenc Industries. Organosilicon compositions particularly suitable for the non-stick, rub-resistant treatment of cellulosic and synthetic materials. 4,028,298, Cl. 260-29.1SB.

Dunlop Limited: *See—*
Goodfellow, Anthony Gerald; and Rand, Maurice, 4,028,042.
Kenney, Michael John, 4,027,713.

Dunn, Allan R. Multi-angle U-shaped hub for infusion member. 4,027,668, Cl. 128-214.00R.

Dunn, Maurice J.: *See—*
Kolman, Philip; Dunn, Maurice J.; and Tiersten, David, 4,027,971.

Du Pont de Nemours, E. I., and Company: *See—*
Cramer, Richard David, 4,028,429.

Spinosa, Dominic J.; and Camillucci, Edward R., 4,027,386.

Eastman Kodak Company: *See—*
Bogan, Richard T.; and Shelton, Claude M., 4,028,436.
Hannie, David Eugene, 4,028,103.
Lamberts, Robert L.; and Nail, Nelson R., 4,028,109.
Sturmer, David M., 4,028,113.

Eberle, William J., to General Battery Corporation. Automatic air leak testing apparatus and method. 4,027,797, Cl. 209-74.00R.

Eck, Bruno. Impeller blade reinforcement. 4,028,005, Cl. 416-186.00R.

Eckert, John S. Tower support plate. 4,028,442, Cl. 261-94.000.

Ediar, Serge: *See—*
Jourdan, Francis; Couderc, Georges; and Ediar, Serge, 4,028,544.

Edstrom, Gene K.: *See—*
Edstrom, Keith G.; and Edstrom, Gene K., 4,027,785.

Edstrom, Keith G.; and Edstrom, Gene K., to Chicago Commutator, Inc. Dual pump colorant dispenser. 4,027,785, Cl. 222-135.000.

Edwards Engineering Corporation: *See—*
Edwards, Ray C., 4,027,495.

Edwards, Gerald L., to CX Corporation. Position locating using digital logic controlled by pulse propagation time intervals. 4,028,619, Cl. 324-34.0PS.

Edwards, Harrison F., to Bennett-Ireland, Inc. Fireplace enclosure. 4,027,650, Cl. 126-140.000.

Edwards, Ray C., to Edwards Engineering Corporation. Vapor recovery system for volatile liquids and vapor condensing epperatus for use therein. 4,027,495, Cl. 62-54.000.

Edwin Cooper & Company Limited: *See—*
Moat, Nicholas Warrington, 4,028,117.

Efremkin, Vladimir Vasilievich: *See—*
Cherednichenko, Vladimir Semenovich; Orlov, Gennady Ivanovich; Mikulinsky, Aron Semenovich; Arzamastsev, Jury Semenovich; Efremkin, Vladimir Vasilievich; Nikitin, Valentin Alexeevich, deceased; Nikitina, Valentine Kuzmimichna, administrator; and Nikitin, Dmitry Valentinovich, administrator, 4,027,861.

Eggenberger, John Scott; and Voegeli, Otto, to International Business Machines Corporation. Field access propagation of bubble lattice. 4,028,685, Cl. 340-174.0TF.

Eichholz, Werner; and Krebs, Gerd, to Phoenis Gummiwerke AG. Winding drum for producing belt inserts for pneumetic tires. 4,028,169, Cl. 156-416.000.

Eichinger, Johann; and Schwibacb, Wilhelm, to Carl Hurth Maschinen-

und Zahnradfabrik. Angle gear drive arrangement. 4,027,553, Cl. 74-801.000.
Eisenberger, Peter Michael, to Bell Telephone Laboratories, Incorporated. X-ray photolithography. 4,028,547, Cl. 250-272.000.
Eisenhardt, Fred W.; and Tonsfeldt, Wayne S. Weed pulling machine. 4,027,733, Cl. 171-58.000.
Eldridge, Robert James: *See—*
Bolto, Brian Alfred; and Eldridge, Robert James, 4,028,255.
Electro Corporation: *See—*
Wilson, Michael A.; and Gee, Gordon E., 4,028,686.
Electronic Engineering Company of California: *See—*
Huntress, Charles B.; and Oabrielian, Henry, 4,028,491.

Kushida, Toshimoto; and Logothetis, Eleftherios M., 4,028,642.
Forni, Jay S. Asbestos-cement pipe fitting and method for making it. 4,027,901, Cl. 285-55.000.
Forsberg, John Wesley, to Lubrizol Corporation, The. Method of rerefining oil with recovery of useful organic additives. 4,028,226, Cl. 208-180.000.
Forster, Heinz: *See—*
Kramer, Wolfgang; Draber, Wilfried; Timmler, Helmut; and Forster, Heinz, 4,028,409.
Foster, Billy E., to United States of America, Energy Research and Development Administration. Method of simulating spherical voids for use as a radiographic standard. 4,028,545, Cl. 250-252.000.
Foster, Edwin E.; and Foster, Thomas E., to Ladney, Michael, Jr. Wheel cover. 4,027,919, Cl. 301-37.0TP.
Foster, Roy Vivian: *See—*
Bays, David Edmund; and Foster, Roy Vivian, 4,028,404.
Foster, Thomas E.: *See—*
Foster, Edwin E.; and Foster, Thomas E., 4,027,919.
Fountain, Gerald F.; Veloz, Jaime; Bilson, Edward A.; and Cronin, John A., to Inspiration Consolidated Copper Company. Froth flotation with sewage treatment plant water effluent. 4,028,235, Cl. 210-44.000.
Fowler, John T.; and Furey, Donald R., to Laitram Corporation, The. Single pivot remote reading compass. 4,027,398, Cl. 33-363.00K.
Fox, Daniel Wayne, to General Electric Company. Thermally stable flame-retardant thermoplastic molding composition. 4,028,335, Cl. 260-45.75B.
Fozell, Gunnar. Method and device for simultaneous screening of sets of color-separated half-tone negatives. 4,027,969, Cl. 355-73.000.
Frame, Bruce H., to Raymond Lee Organization, Inc., The, a part interest. Bicycle type ski apparatus. 4,027,891, Cl. 280-7.140.
Franaszek, Peter Anthony; and Thompson, David Allen, to International Business Machines Corporation. Apparatus and method for generating a data code with a spectral null. 4,028,535, Cl. 235-152.000.
Francis, Robert John; and Allen, John Glyn, to Hoffmann-La Roche Inc. Isoquinoline derivatives. 4,028,363, Cl. 260-286.00R.
Frank, Earl E.; and Yee, Bing S., to Abex Corporation. Hydraulic apparatus. 4,027,595, Cl. 104-26.00A.
Frank W. Schaefer Inc.: *See—*
Schaefer, Carl W. D.; Schaefer, Richard L.; and Kennedy, Gordon F., 4,027,862.
Frankenberg, Robert J., to Hewlett-Packard Company. Method and apparatus for refreshing semiconductor memories in multi-port and multi-module memory system. 4,028,675, Cl. 340-172.500.
Franklin, John S., to General Electric Company. Luminaire. 4,028,541, Cl. 240-25.000.
Frankort, Frans Josef Maria: *See—*
Franssen, Nico Valentinus; and Frankort, Frans Josef Maria, 4,028,566.
Franks, C. Richard: *See—*
Lewis, David L.; Franks, C. Richard; and Schenker, Barry A., 4,028,215.
Franssen, Nico Valentinus; and Frankort, Frans Josef Maria, to U.S. Philips Corporation. Electroacoustic conversion device having a diaphragm comprising at least one of a piezoelectric polymer material. 4,028,566, Cl. 310-9.500.
Franz Plasser Bahnbaumaschinen-Industrie-Gesellschaft m.b.H.: *See—*
Theurer, Josef; and Riessberger, Klaus, 4,027,397.
Frazee, Ralph Edward, Jr.; and Watkins, Laurence Shrapnell, to Western Electric Company,. Method and apparatus for determining ratio of core radius to cladding radius in clad optical fibers. 4,027,977, Cl. 356-111.000.
Frazer, Alson C.: *See—*
Heilig, Louis F.; and Frazer, Alson C., 4,027,834.
Frech, Roger Alvan; and Bonder, Martin Moses, to Terminal Data Corporation. End for end document inverter. 4,027,870, Cl. 271-65.000.
Frechette, Raymond A.: *See—*
Cassidy, Stephen; Beboian, Robert; Frechette, Raymond A.; Haynes, Gardner S.; and Ross, John W., 4,028,064.
Frechin, Jean-Paul; and Vaudaux, Francis, to Garcia Corporation. Ski binding. 4,027,896, Cl. 280-618.000.
Fred M. Dellorfano, Jr., and Donald P. Mussa, Trustees of The Stoneleigh Trust u/d/t: *See—*
Massa, Frank, 4,028,504.

Hasegawa, Akira: *See—*
Hirashima, Kenzo; Tsujimura, Harutoshi; Hasegawa, Akira; Tanigami, Takahiko; and Ushiku, Kenichi, 4,028,516.

Hasenwinkle, Earl Dean; and Wislocker, Frank, to Weyerhaeuser Company. Machine for conveying sector shaped pieces. 4,027,769, Cl. 198-570.000.

Hashiguchi, Yukihide: *See—*
Goto, Kenji; Shibata, Norio; and Hashiguchi, Yukihide, 4,027,635.

Hashimoto, Makoto; Uehara, Shinzi; Sugita, Tadashi; and Shiina, Naonori, to Furukawa Electric Co., Ltd., The. Method of molding plastics material. 4,028,448, Cl. 264-37.000.

Hassinger, Donald F.: *See—*
Jacob, Keith D., 4,027,953.

Hattes, Neil R.: *See—*
Brown, Allen C.; Hattes, Neil R.; and Eyrick, Theodore B., 4,028,444.

Hauraux, Pierre; and Domer, Michel, to Paulstra. Resilient mounting for vehicle bumper bar. 4,027,909, Cl. 293-88.000.

Hawes, Allen R.: *See—*
Hawes, Edward L.; Hawes, Allen R.; and Hawes, Edward C., 4,027,899.

Hawes, Edward C.: *See—*
Hawes, Edward L.; Hawes, Allen R.; and Hawes, Edward C., 4,027,899.

Hawes, Edward L.; Hawes, Allen R.; and Hawes, Edward C. Motorcycle trailer. 4,027,899, Cl. 280-722.000.

Hawkins, Wallace H. Coupling head for securing a vehicle towing assembly. 4,027,894, Cl. 280-502.000.

Haworth, John: *See—*
Hagon, Peter J.; and Haworth, John, 4,028,639.

Hay, Allan S., to General Electric Company. Process for the preparation of polyphenylene oxides with hydrolytically stable copper catalysts. 4,028,341, Cl. 260-47.0ET.

Hayashi, Hideo: *See—*
Tauchiya, Shozo; Sato, Hisetake; Oshima, Akio; and Hayashi, Hideo, 4,028,291.

Hayashi, Jun: *See—*
Hinata, Masaneo; Takei, Haruo; Sato, Akira; Iwamoto, Atsuo; and Hayashi, Jun, 4,028,115.

Hayashi, Kazuya; Mizunuma, Takeji; and Yokotsuka, Tamotsu, to Kikkomen Shoyu Co., Ltd. Process for producing koji for fermented food products. 4,028,470, Cl. 426-11.000.

Hayes, John C.; and Pollitzer, Ernest L., to UOP Inc. Guard beds in hydrocarbon conversion with an acidic multimetallic catalytic composite. 4,028,223, Cl. 208-91.000.

Hayes, William H., Jr.: *See—*
Lyon, Warren Charles; and Hayes, William H., Jr., 4,027,661.

Hayes, William Roger; and Shikasho, Satoru, to International Telephone and Telegraph Corporation. Solar heating/cooling system. 4,027,821, Cl. 237-1.00A.

Haynes, Gardner S.: *See—*
Cassidy, Stephen; Baboian, Robert; Frechette, Raymond A.; Haynes, Gardner S.; and Ross, John W., 4,028,064.

Haynie, Gerald Demarest: *See—*
Evans, James Gifford; and Haynie, Gerald Demarest, 4,028,622.

Heard, George E.; and McPherson, Thomas Buchanan, IV, to Coors Container Company. Method for processing used emulsion coolant. 4,027,685, Cl. 134-10.000.

Heavner, George A.: *See—*
Fessler, Dyral C.; Heavner, George A.; and Massey, Thomas H., 4,028,401.

Heavner, Paul William, Jr.; and Long, Gregor Dean, to Baxter Travenol Laboratories, Inc. Diagnostic electrode assembly with a skin preparation surface. 4,027,664, Cl. 128-2.06E.

Heberlein Maschinenfabrik AG: *See—*
Brehm, Gustav, 4,027,466.

Hebert, Elie Loyd, to Celanese Corporation. Apparatus for precision electrostatic pinning. 4,028,032, Cl. 425-174.80E.

Hechtfischer, Gustav: *See—*
Satzinger, Gerherd; and Hechtfischer, Gustav, 4,028,398.

Hegar, Gert; and Angliker, Hans-Joerg, to Ciba-Geigy AG. Process for making azo compounds by coupling with nitrosated heterocyclic primery amines. 4,028,323, Cl. 260-157.000.

Heggie, William S., to Canadian Patents and Development Limited. Transducer for engine fuel injection monitoring. 4,027,536, Cl. 73-398.0AR.

Heilig, Louis F.; and Frazer, Alson C., to Ford Aerospace & Communications Corporation. Missile nozzle configuration. 4,027,834, Cl. 244-3.110.

Helde, Robert W., to Motorola, Inc. Contact bonded packaged integrated circuit. 4,028,722, Cl. 357-70.000.

Heller, Lawrence Griffith; Terman, Lewis Madison; and Yee, Yen Sung, to International Business Machines Corporation. High accuracy MOS comparator. 4,028,558, Cl. 307-355.000.

Henkels, Walter H., to International Business Machines Corporation. Ultralow-power, micro-miniaturized Josephson devices having high inductance. 4,028,714, Cl. 357-5.000.

Henley, John C., III. Process and apparatus for producing printed matter. 4,028,107, Cl. 96-41.000.

Henry, Walton M.: *See—*
Seidl, Maximilian R.; Seidl, Joachim; and Henry, Walton M., 4,027,590.

Partridge, John Joseph, Jr.; and Uskokovic, Milan Redoje, 4,028,349.

Hohner, Gary Arlyn; and Hyldon, Roy Godfrey, to Quaker Oats Company, The. Oat groat fractionation process. 4,028,468, Cl. 426-436.000.

Holland, Frank Stanley, to National Development Research Corporation. Method of producing metal powder. 4,028,199, Cl. 204-10.000.

Hollandsche Wegeobouw Zanen B.V.: *See—*
van den Berg, Antoon J., 4,028,293.

Hollymatic Corporation: *See—*
Wagner, Richard C.; and Benike, Ronald A., 4,027,356.

Holmberg, Leif, to European Plastic Machinery Mfg. A/S. Apparatus for establishing contact between a liquid and a gas. 4,028,244, Cl. 210-150.000.

Holmlund, Gary Wayne; and Ichino, Toshio, to Hewlett-Packard Company. Marker circuit. 4,028,587, Cl. 315-377.000.

Holmstrom, Hakan: *See—*
Rausing, Ruben; Nedstedt, Gert; Holmstrom, Hakan; Palm, Lars-Erik; and Stefan, Stjepan, 4,027,455.

Honda Giken Kogyo Kabushiki Kaisha: *See—*
Hirosawa, Yoshiaki; Nomura, Toshio; and Iiyama, Masahiko, 4,027,640.
Yamamoto, Takenori; Tsukisaka, Tauneo; and Tsukahara, Takeshi, 4,027,914.

Hooeywell Inc.: *See—*
Higashide, Carlos S., 4,028,669.
Kasenga, Anthony F., 4,028,145.

Honeywell Information Systems, Inc.: *See—*
Monahen, Earnest M.; and Patterson, Garvin W., 4,028,664.
Riikonen, Douglas L., 4,028,668.

Honeywell Information Systems Italia: *See—*
Orlando, Luciano, 4,028,612.

Honkawa, Yoshinori: *See—*
Tasaka, Tomoyuki; and Honkawa, Yoshinori, 4,027,588.

Honore, Etienne A. H.; and Torcheux, Emile L. G., to Societe d'Etude et d'Application des Techniques Nouvelles NEO-TEC. Apparatus for radio position-fixing of the hyperbolic phase-measurement type. 4,028,703, Cl. 343-105.00R.

Hooker Chemicals & Plastics Corporation: *See—*
Kahn, Heory; and Schall, William L., 4,028,329.

Hooker, Joe B., to Metal Bed Rail Company, division of Leggett & Platt, Inc. Bed frame with detachable and interchangeable components. 4,027,343, Cl. 5-200.00R.

Hopkins, Donald L., to Caterpillar Tractor Co. Reversible, variable-

displacement piston pump with positioner means for automatic return to zero displacement. 4,028,010, Cl. 417-217.000.
Hoppner, Werner F.; Spinelli, Richard A.; and Allis, Robert F., to Xerox Corporation. Multi-mode reproducing apparatus. 4,027,963, Cl. 355-8.000.
Hoppough, Richard Scott, to Bell Telephone Laboratories, Incorporated. Apparatus for applying particular voltages to three-terminal circuits and measuring resulting current flows for the purpose of determining circuit characteristics. 4,028,507, Cl. 179-175.30R.
Hori, Haruo; Kikuchi, Shoji; Wada, Hajime; Kobayasi, Sadatosi; and Endo, Takaya, to Konishiroku Photo Industry Co., Ltd. Method for developing an exposed silver halide color photosensitive material. 4,028,106, Cl. 96-55.000.
Horikoshi, Yoshiji, to Nippon Telegraph and Telephone Public Corporation. Method of epitaxially growing a laminate semiconductor layer in liquid phase. 4,028,148, Cl. 148-171.000.
Horling, Peter: *See—*
Kunkel, Heinrich; Brandenstein, Manfred; Olschewski, Armin; Finzel, Sigismund; Gossmann, Willi; and Horling, Peter, 4,027,932.
Horvath, Gyula: *See—*
Bite, Pal; Moravcsik, Imre; Schafer, Inge; Horvath, Gyula; Mebesfalvi nee Vajna, Zsuzsanna; Borvendeg, Janos; and Hermann nee Szente, Ilona, 4,028,348.
Horveth, Lajos (Louis), to Gurtler, Hebert & Co., Inc. Deviated conductor driving system. 4,027,734, Cl. 175-9.000.
Hosaka, Yukio: *See—*
Yamamoto, Tomio; Sakasegawa, Koji; Ozumi, Atsushi; Hosaka, Yukio; and Yamada, Takeo, 4,027,978.
Hoshino, Norio: *See—*
Konishi, Yoshihiro; Konno, Kenichi; Yazawa, Norihiko; and Hoshino, Norio, 4,028,650.
Hotta, Seiji; Koga, Koichi; Bando, Tomoyuki; and Kondo, Yutaka, to Sumitomo Chemical Company, Limited; and Kyodo Chemical Company, Ltd. Ultra violet absorber. 4,028,331, Cl. 260-45.8NT.
Hounsfield, Godfrey Newbold, to EMI Limited. Radiology. 4,028,554, Cl. 250-445.00T.
House, Aniel Hermas, Jr. Cleat for climbing trees and the like. 4,027,742, Cl. 182-92.000.
Hovagimyan, Norman; Iadicola, Anthony Domenic; and Ianuzzi, William Paul, to RCA Corporation. Universal/assigned night answering system for EPABX. 4,028,499, Cl. 179-18.0BD.
Howlett, Mason M.: *See—*
Evans, Kenneth W.; Howlett, Mason M.; and Kirkpatrick, David H., 4,027,755.
Hrometka, Otto; and Binder, Dieter, to BASF Aktiengesellschaft. Thiophene saccharines. 4,028,373, Cl. 260-301.000.
Hu, Daniel C.: *See—*
Deal, Bruce E.; and Hu, Daniel C., 4,027,380.
Hubbard, David W., to Pitney-Bowes, Inc. Method for printing a manually scannable bar code and articles carrying a vertically extended bar code. 4,027,586, Cl. 101-93.010.
Huber, Rudolf: *See—*
Kuhnelt, Herbert; and Huber, Rudolf, 4,027,744.
Hubsch, Gunter; Bendler, Hellmut; Stahlmann, Rudolf; and Gawlick, Heinz, to Dynamit Nobel Aktiengesellschaft. Propellant charge igniter with striker element. 4,027,592, Cl. 102-70.00R.
Huddleston, Jack M., to National Distillers and Chemical Corporation. Bearing lubricator. 4,027,929, Cl. 308-97.000.
Hufenus, Paul Francis Marcel. Tennis racket with variable balance and weight. 4,027,881, Cl. 273-73.00R.
Huffhines, Donald F.: *See—*
Guenther, Robert O.; Huffhines, Donald F.; Krall, James W.; and Ray, Charles D., 4,027,616.
Hughes Aircraft Company: *See—*
Graube, Andreja, 4,028,104.
Kamath, O. Sanjiv; and Smith, Bradley W., 4,028,147.
King, Harry J., 4,028,579.
Leetmaa, Juri G., 4,028,651.
Zurcher, Rudolf F., 4,028,509.
Hughes, Richard Swart, to United States of America, Navy. Acoustooptical deflector tuned organic dye laser. 4,028,636, Cl. 331-94.50C.
Hugues, Edgard Alfred, to U.S. Philips Corporation. Single optical lens with large aperture and large field. 4,027,952, Cl. 350-189.000.
Hujimori, Masao; Nakajima, Shigeo; Takahashi, Ken; Ito, Tsunetoshi; Shimada, Toshio; and Endo, Hajime, to Taiheiyo Engineering Incorporated. Longwall coal mining machine with plural cutters on subranging arm. 4,027,918, Cl. 299-53.000.
Hulsebos, Jan, to Cities Service Company. Process and apparatus for recovering dissolved copper from solutions containing copper. 4,027,864, Cl. 266-170.000.
Hungerford & Terry, Inc.: *See—*
Davis, Raymond R.; Langberg, Alfred M.; and Debus, Alvin P., 4,028,241.
Hunt, Charles d'A., to Airco, Inc. Electron beam furnace. 4,027,722, Cl. 164-64.000.
Hunt, Paulmer D., to Bendix Corporation, The. Fluid pressure responsive transducer apparatus. 4,027,481, Cl. 60-533.000.
Hunter Douglas International N.V.: *See—*
Brugman, Johannes Antonius Henricus, 4,027,446.
Huntress, Charles B.; and Gabrielian, Henry, to Electronic Engineering Company of California. Transducer switching system. 4,028,491, Cl. 179-1.0SW.
Hurley, Carson Monroe. Recation speed training device. 4,027,875, Cl. 272-76.000.
Hurni, William M.: *See—*
McAleer, William J.; and Hurni, William M., 4,028,190.
Huschka, Hans; Schmutz, Hermann; and Vygen, Peter, to Nukem G.m.b.H. Fuel particles with coatings without property gradients. 4,028,181, Cl. 176-82.000.
Hycom Incorporated: *See—*
Motley, David M.; and Cheng, King Y., 4,028,626.
Hyldon, Roy Godfrey: *See—*
Hohner, Gary Arlyn; and Hyldon, Roy Godfrey, 4,028,468.

Kobiske Industries, Inc.: *See—*
Kobiske, Gerald F., 4,028,017.

Koch, Robert E., to General Electric Company. Electrical current limiting fuse with bound sand filler and improved low current fault clearing. 4,028,655, Cl. 337-160.000.

Kodo, Masatsugu: *See—*
Uchii, Jiro; Kodo, Masatsugu; Soga, Tsunehiko; and Morimoto, Yutaka, 4,028,070.

Koerner, Gotz: *See—*
Fink, Hens-Ferdi; Fritsch, Herwig; Koerner, Gotz; Rossmy, Gerd; and Schmidt, Gunter, 4,028,218.

Koga, Koichi: *See—*
Hotta, Seiji; Koga, Koichi; Bando, Tomoyuki; and Kondo, Yutaka, 4,028,331.

Kogaku Ltd.: *See—*
Fukushige, Tatsuzo, 4,027,942.

Koike, Yuuji: *See—*
Nemoto, Hideo; and Koike, Yuuji, 4,027,936.

Kokubo, Takashi: *See—*
Kakiteni, Haruski; Maekawa, Masao; and Kokubo, Takashi, 4,028,449.

Kokurin, Vyacheslav Alexandrovich; Bakulov, Igor Alexeevich; and Kotlyerov, Vitaly Mikhailovich. Method of thermal disinfection of sewage and plant realizing same. 4,028,242, Cl. 210-71.000.

Kokusai Denshin Denwa Kabushiki Kaisha: *See—*
Niiro, Yasuhiko, 4,028,644.

Kokusai Gijutsu Kaihatsu Kabushiki Kaisha: *See—*
Nakauchi, Shunsaku, 4,027,762.

Kolar, Miloslav: *See—*
Safer, Petr; Langr, Josef; Kolar, Miloslav; and Nosek, Stanislav, 4,027,705.

Kollonitsch, Janos; and Kahan, Frederick M., to Merck & Co., Inc. Fluorinated amino acids. 4,028,405, Cl. 260-534.00C.

Kolmen, Philip; Dunn, Maurice J.; and Tiersten, David. Method of simultaneously counting blood cells. 4,027,971, Cl. 356-36.000.

Komarek, Karl R., to K. R. Komarek, Inc. Frameless briquetting machine. 4,028,035, Cl. 425-363.000.

Komarniski, John Victor. Multiple chemistry analyzer. 4,027,979, Cl. 356-180.000.

Komatsu, Kazurou: *See—*
Ogawa, Shinsaku; Ide, Akira; Komatsu, Kazurou; Matsumoto, Sojiro; and Kishimoto, Yasushi, 4,028,392.

Komatsu, Yasutoshi; and Yanagisawa, Yuzuru, to Sony Corporation. Surface acoustic wave filter. 4,028,649, Cl. 333-72.000.

Komoto, Hiroshi: *See—*
Doi, Tsunesuke; Komoto, Hiroshi; Chono, Masazumi; Inoue, Akira; Saito, Kazuaki; and Shinozuka, Isao, 4,028,055.

Kondo, Toshiyuki, to Aisin Seiki Kabushiki Kaisha. Anti-skid brake control device for vehicles. 4,027,924, Cl. 303-92.000.

Kondo, Yutaka: *See—*
Hotta, Seiji; Koga, Koichi; Bando, Tomoyuki; and Kondo, Yutaka, 4,028,331.

Konishi, Yoshihiro; Konno, Keoichi; Yazawa, Norihiko; and Hoshino, Norio, to Nippon Hoso Kyokai. Microwave circuits constructed inside a waveguide. 4,028,650, Cl. 333-73.00W.

Konishiroku Photo Industry Co., Ltd.: *See—*
Hori, Haruo; Kikuchi, Shoji; Wada, Hajime; Kobayasi, Sadatosi; and Endo, Takaya, 4,028,106.

Konno, Keoichi: *See—*
Konishi, Yoshihiro; Konno, Kenichi; Yazawa, Norihiko; and Hoshino, Norio, 4,028,650.

Konter, Wolfgang; Witte, Josef; Vehlewald, Peter; and Block, Hans-Dieter, to Bayer Aktiengesellschaft. Graft polymers of vinyl phosphonic acid esters. 4,028,434, Cl. 260-874.000.

Koprowski, Hilary: *See—*
Kritchevsky, David; Koprowski, Hilary; and Makolska, Hanna, 4,028,469.

Korfil, Incorporated: *See—*
Nickerson, David L., 4,027,445.

Koritsu Kikaikogyo Co., Ltd.: *See—*
Nagayoshi, Konno, 4,028,193.

Korl, Peter: *See—*
Petritsch, Klaus; and Korl, Peter, 4,028,407.

Korpman, Ralf, to Johnson & Johnson. Hot melt adhesive. 4,028,292, Cl. 260-27.00R.

Koski, Kaijo Aatto Matias: *See—*
Christell, Adolf Ragnar Roland Umberto Einarsson; Koski, Kaijo Aatto Matias; and Ljunggren, Knut Lennart, 4,028,267.

Kotche, Ervin, to Kotche, Ervin H. Cleaning pad. 4,027,350, Cl. 15-104.930.

Kotche, Ervin H.: *See—*
Kotche, Ervin, 4,027,350.

Kotlyarov, Vitaly Mikhailovich: *See—*
Kokurin, Vyacheslav Alexandrovich; Bakulov, Igor Alexeevich; and Kotlyarov, Vitaly Mikhailovich, 4,028,242.

Kotzsch, Hans-Joachim: *See—*
Vahlensieck, Hans-Joachim; Seiler, Claus-Dieter; and Kotzsch, Hans-Joachim, 4,028,384.

Kovacs, Bela V.: *See—*
Cole, Gerald S.; Kovacs, Bela V.; Sensoli, Robert A.; and Smartt, Herschel B., 4,028,099.

Kraftwerk Union Aktiengesellschaft: *See—*
Keller, Herbert; Krieg, Bruno; and Romer, Ludwig, 4,027,996.

Krall, James W.: *See—*
Guenther, Robert O.; Huffhines, Donald F.; Krall, James W.; and Ray, Charles D., 4,027,616.

Kramer, Joseph S.: *See—*
United States of America, National Aeronautics and Space Administration; Creel, Theodore R., Jr.; Jones, Robert A.; Corwin, Richard R.; and Kramer, Joseph S., 4,027,524.

Kramer, Petrus A.: *See—*
van den Brink, Marinus J.; Austermuhle-Bertola, Helena; and Kramer, Petrus A., 4,028,418.

Kramer, Richard W. Low well yield control system. 4,028,011, Cl. 417-278.000.

Kramer, Wolfgang; Draber, Wilfried; Timmler, Helmut; and Forster, Heinz, to Bayer Aktiengesellschaft. Process for the preparation of α-oxothiodimethylamide compounds. 4,028,409, Cl. 260-551.00S.

Krandex Corporation: *See—*
Slingluff, Eugene L., 4,027,659.

Kraupa, Werner, to Siemens Aktiengesellschaft. Nuclear reactor installation. 4,028,176, Cl. 176-38.000.

Kraus, Heinz, to Loewe-Opta GmbH. Arrangement for varying the excitation of a deflection circuit in response to load changes and the like. 4,028,588, Cl. 315-387.000.

Krauss-Maffei Aktiengesellschaft: *See—*
Lang, Andreas, 4,027,597.

Krauss, Timothy A., to United Technologies Corporation. Torsionally compliant helicopter rotor blade with improved stability and performance characteristics. 4,028,003, Cl. 416-141.000.

Krebs, Gerd: *See—*
Eichholz, Werner; and Krebs, Gerd, 4,028,169.

Krenzer, John, to Velsicol Chemical Corporation. Thiadiazolylimidazolidinones. 4,028,375, Cl. 260-306.80D.

Krieg, Bruno: *See—*
Keller, Herbert; Krieg, Bruno; and Romer, Ludwig, 4,027,996.

Kritchevsky, David; Koprowski, Hilary; and Makolska, Hanna. Bread containing alfalfa. 4,028,469, Cl. 426-551.000.

Krofchalk, Gary F.; and Dodds, Andrew D., to Kando Incorporated. Stair-climbing carrier. 4,027,889, Cl. 280-5.220.

Krohn, David A.; Grolman, Bernard; and Siegmund, Walter P., to American Optical Corporation. Method of making artificial intraocular lenses with holes. 4,028,082, Cl. 65-23.000.

Kroposki, Lorraine M.; Yoshimine, Masao; and Freedman, Harold H., to Dow Chemical Company, The. Process for preparing phosphorothioates and phenylphosphonothioates. 4,028,439, Cl. 260-973.000.

Krum, Jack Kern; Wollermann, Louis Albert; and Rucker, Dugan Allan, to International Telephone and Telegraph Corporation. Yeast leavened dough composition. 4,028,471, Cl. 426-22.000.

Krupka, Yaakov: *See—*
Fischler, Henryk; Krupka, Yaakov; and Itzchak, Jacov, 4,027,663.

Ku, San-Mei: *See—*
Deines, John L.; Ku, San-Mei; Poponiak, Michael R.; and Tsang, Paul J., 4,028,149.

Kugelmann, Adolf: *See—*
Streit, Klaus; Kugelmann, Adolf; and Seiler, Hartmut, 4,028,564.

Kuhnelt, Herbert; and Huber, Rudolf, to Hoerbiger Fluidtechnik KG. Pneumatic pulse hydraulic controlled valve for controlling a lubricating device. 4,027,744, Cl. 184-7.00F.

Kulker, Otto, to Westfalia Separator AG. Self-cleaning centrifugal drum for the periodical removal of a portion of the solids seperated from a liquid and collecting in the peripheral part of the interior of the drum. 4,027,820, Cl. 233-20.00A.

Kum, Dong Woo. Joint connector for bars. 4,027,988, Cl. 403-218.000.

Kumar, Narayan Ganesh: *See—*
Litt, Morton H.; and Kumar, Narayan Ganesh, 4,028,132.

Kumasaka, Kazuhiro: *See—*
Tomishima, Hiroshi; Takahashi, Toshio; Ono, Kenichi; and Kumasaka, Kazuhiro, 4,028,144.

Kumisi Chemical Industry Co., Ltd.: *See—*
Jikihara, Kazuo; Iori, Shinichi; Kimura, Ichiro; and Adachi, Kyoichi, 4,028,091.

Kummer, Horst: *See—*
Zschocke, Albrecht; Kummer, Horst; and Adolphi, Heinrich, 4,028,399.

Kumpfer, Beverly D.: *See—*
De Weese, Raymond Paul; and Kumpfer, Beverly D., 4,028,519.

Kunesh, John G.: *See—*
Nolley, John P., Jr.; and Kunesh, John G., 4,028,069.

Kunihiro, Toshiro: *See—*
Funamo, Hiroshi; Kunihiro, Toshiro; and Murai, Masaaki, 4,028,495.

Kunkel, Heinrich; Brandenstein, Manfred; Olschewski, Armin; Finzel, Sigismund; Gossmann, Willi; and Horling, Peter, to SKF Industrial Trading and Development Company B.V. Clutch release bearing. 4,027,932, Cl. 308-233.000.

Kuntz, Ronald W. Pace setting light for joggers. 4,028,693, Cl. 340-323.00R.

Kunz, Harold Russell, to United Technologies Corporation. Support material for a noble metal catalyst and method for making the same. 4,028,274, Cl. 252-447.000.

Kurahashi, Suminobu: *See—*
Sato, Shigetake; Kurahashi, Suminobu; Okuyama, Toru; and Hamada, Noboru, 4,028,287.

Kuraray Co., Ltd.: *See—*
Fujita, Yoshiji; Omura, Yoshiaki; Nishida, Takashi; and Itoi, Kazuo, 4,028,385.

Fukushima, Osamu; Nagoshi, Kazuo; and Iwamoto, Toshiaki, 4,028,161.

Kureha Kagaku Kogyo Kabushiki Kaisha: *See—*
Enomoto, Satoru; Takita, Hitoshi; Wada, Hisayuki; Mukaida, Yutaka; and Yaneka, Mikiro, 4,028,387.

Kurode, Michio; Namura, Kiyoshi; Kato, Fumio; Yamazaki, Yoshiaki; Iwasaki, Tutomu; Ishida, Akira; Sohma, Akio; and Imai, Tetsu, to Hitachi, Ltd. Bucket cover attachment. 4,028,006, Cl. 416-191.000.

Kurtz, Donald R.; Popadick, Carl C.; Sofianek, Joseph C.; and Talento, Joseph L., to General Electric Company. High current vacuum circuit interrupter with beryllium contact. 4,028,514, Cl. 200-144.00B.

Kushida, Toshimoto; and Logothetis, Eleftherios M., to Ford Motor Company. Circuit for converting a temperature dependent input signal to a temperature independent output signal. 4,028,642, Cl. 323-75.00B.

Kuster, Heinz: *See—*
Funk, Adolf; and Kuster, Heinz, 4,027,509.

Kutschera, Heinz: *See—*
Zinsstag, Christoph; Kutschera, Heinz; and Knutti, Dietrich, 4,028,239.

Kveerner Brug A/S: *See—*
Fagerheug, Bjorn; and Oberg, Karl, 4,028,189.

Kwest, Theodore Emil; and Smith, Gordon Marlon, to Singer Company, The. Flange spreader. 4,027,373, Cl. 29-256.000.

Kyodo Chemical Company, Ltd.: *See—*
Hotta, Seiji; Koga, Koichi; Bando, Tomoyuki; and Kondo, Yutaka, 4,028,331.

Kyodo Denshi Kogyo Co., Ltd.: *See—*
Ohishi, Tadashi, 4,027,982.

Kyorin Pharmaceutical Co., Ltd.: *See—*
Irikura, Tsutomu, 4,028,370.

La Telemecanique Electrique: *See—*
Bouteille, Daniel; Hardouin, Pierre; and Thomasse, Andre, 4,027,692.

Labedan, Pierre; Mugnier, Robert; and Chavanel, Hubert, to Rhone-Poulenc. Electrolysis cell. 4,028,209, Cl. 204-252.000.

LaBelle, Harold E., Jr.; and Cronan, Charles J., to Tyco Laboratories, Inc. Multiple dies for ribbon. 4,028,059, Cl. 23-273.0SP.

Laboratorios Made, S.A.: *See—*
Jarque, Ricerdo Granados; Cartes, Juan Bosch; Cabiro, Jorge Canals; Roldan, Cristobal Martinez; and Peinedo, Rabadan, 4,028,371.

Labus, Herwig, to Kernforschungsanlage Julich Gesellschaft mit beschrankter Haftung. Fluid operable rotary piston device. 4,028,023, Cl. 418-108.000.

Ladney, Michael, Jr.: *See—*
Foster, Edwin E.; and Foster, Thomas E., 4,027,919.

Ladrigan, J. William, to Xerox Corporation. Transfer system for electrostatic reproduction machine. 4,027,960, Cl. 355-3.00R.

Leferty, John M., Jr.; Ritsko, Joseph E.; and Port, David J., to GTE Sylvania Incorporated. Free flowing powder and process for producing it. 4,028,095, Cl. 75-.5AB.

Laitram Corporation, The: *See—*
Fowler, John T.; and Furey, Donald R., 4,027,398.

LaJovic, Dusan S., to Colgate-Palmolive Company. Method for protectively covering container necks. 4,028,459, Cl. 264-159.000.

LaMarche, Robert Ernest; May, Carl Jerome, Jr.; and Zebo, Timothy James, to Bell Telephone Laboratories, Incorporated. Digital speech detector. 4,028,496, Cl. 179-15.0AS.

Lamberts, Robert L.; and Nail, Nelson R., to Eastman Kodak Company. Photographic transparency for producing a lenticular array. 4,028,109, Cl. 96-116.000.

Lamburn, Alan Selisbury: *See—*
Hamblin, Leslie Frank, 4,027,440.

Lampe, Wolfgang: *See—*
Carlsson, Tage; and Lampe, Wolfgang, 4,028,653.

Lampl, Friedrich; and Paul, Thomas Campbell, to Dowty Meco Limited. Scraper chain conveyor. 4,027,793, Cl. 198-719.000.

Lang, Andreas, to Krauss-Maffei Aktiengesellschaft. Linear induction motor with damping cage. 4,027,597, Cl. 104-148.0MS.

Langberg, Alfred M.: *See—*
Davis, Raymond R.; Langberg, Alfred M.; and Debus, Alvin P., 4,028,241.

Lange, Gerd: *See—*
Sturban, Klaus; and Lange, Gerd, 4,027,619.

Lange, Harold Carl; and MacLeay, Ronald Edward, to Pennwalt Corporation. α-isocyanato and ω-isothiocyanato azos and their derivatives. 4,028,344, Cl. 260-174.000.

Langenstuck, Alfons: *See—*
Elaner, Wolfgang; Moslener, Jorn; and Langenstuck, Alfons, 4,027,565.

Langere, Ronald Francis; and Loeffler, Otto Ernest, to NL Industries, Inc. Stabilized hydrous pentavalent antimony oxide sol composition and its production, production of dry powder from sol composition and resulting dry powder. 4,028,266, Cl. 252-313.00R.

Langford, Obie M.: *See—*
Peelman, Harold E.; and Langford, Obie M., 4,028,546.

Langheim, Detlef: *See—*
Wenzel, Martin; and Langheim, Detlef, 4,028,389.

Langlie, Howard: *See—*
Berg, Albert T., Jr.; and Langlie, Howard, 4,028,489.

Langlois, Roland E., to Owens-Corning Fiberglas Corporation. Method for removing particulate pollutants from stack gases. 4,028,071, Cl. 55-89.000.

Langr, Josef: *See—*
Safer, Petr; Langr, Josef; Kolar, Miloslav; and Nosek, Stanislav, 4,027,705.

Lanpher, Edward J.: *See—*
Morton, Avery A.; and Lanpher, Edward J., 4,028,484.

Lantz, Charles Hunter, to B.F. Goodrich Company, The. In-axle vehicle wheel speed sensing device. 4,027,753, Cl. 188-181.00R.

Lapchenko, Alexandr Mikhailovich: *See—*
Mamvriisky, Alexandr Sergeevich; and Lapchenko, Alexandr Mikhailovich, 4,027,860.

Larin, Konstantin Leonidovich: *See—*
Gudzenko, Nikolai Vasilievich; Zaichenko, Mikhail Efimovich; and Larin, Konstantin Leonidovich, 4,028,009.

Larkin, John M.: *See—*
Duranleau, Roger G.; and Larkin, John M., 4,028,388.

Larner, Douglas Stanley, to Plessey Handel und Investments A.G. Regenerative repeater circuit arrangement for use in digital date transmission systems. 4,028,559, Cl. 307-246.000.

Larson, Ivar W.: *See—*
Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., 4,028,538.

Larsson, Hans Evald. Cross-country ski having alternate sliding and holding surfaces. 4,027,895, Cl. 280-604.000.

Latva, Henry F., to Chrysler Corporation. Heat treating atmospheres. 4,028,100, Cl. 75-224.000.

Laubach, Ward E., to I-T-E Imperial Corporation. Steel arcing contact for circuit breaker. 4,028,513, Cl. 200-144.00R.

Lauzier, Rene, to Central Automobile Industry Co., Ltd., The. Guard rail. 4,027,855, Cl. 256-21.000.

Lave Crucible Refractories Company: *See—*
Miller, Eldon D.; and Washburn, Ryan F., 4,028,453.

Laverty, Richard C., to Interior Fasteners, Inc. Self-tapping screw fastener with improved thread construction. 4,027,573, Cl. 85-46.000.

Lavery, Elzie E. Combustion engine driven liquid heater. 4,027,631, Cl. 122-26.000.

Lawbaugh, J. Medley, to Raymond Lee Organization, Inc., The. Disposable ashtray liner and mating bowl. 4,027,683, Cl. 131-235.00R.

Lasague, Jean: *See—*
Cottin, Jean; and Lasague, Jean, 4,028,531.

Leach, George S., Jr., to Motorola, Inc. Charge coupled storage device multiplexer. 4,028,671, Cl. 340-173.00R.

Leadvaro, Stepheo J.: *See—*
Getes, Paul E.; Kimball, Stephen F.; and Leadvaro, Stepben J., 4,028,577.

Lear, Anthony: *See—*
Black, Christopher T.; and Lear, Anthony, 4,028,561.

Leesure, William; Garcia, Luis; Reifel, Charles; and Shelton, Jack, to Mira-Pak, Inc. Method and apparatus for opening folded box blanks. 4,027,579, Cl. 93-53.00M.

Le Brasseur, Genevieve, to Societe Chimique des Charbonnages - CdF Chimie. Photodegradable polymer compositions. 4,028,480, Cl. 526-3.000.

LeBus, John W.: *See—*
Vig, John R.; and LeBus, John W., 4,028,135.

Leclair, Alain: *See—*
Beuchee, Daniel; and Leclair, Alain, 4,028,606.

Lee, Arnold S. J., to Milstein Medical Research Foundation, Inc. Automatic blood pressure recorder. 4,027,662, Cl. 128-2.05A.

Leetmaa, Juri G., to Hughes Aircraft Company. Coupled-cavity microwave filter. 4,028,651, Cl. 333-73.00W.

Legille, Edouard, to S.A. des Anciens Etablissements Paul Wurth. Improved tuyere feed device. 4,027,605, Cl. 110-182.500.

Legousse, Maurice: *See—*
Naudy, Rene; Phoyu, Francois; Robert, Louis; Legousse, Maurice; Audouard, Jean-Marie; and Le Roux, Herve, 4,028,049.

Legrand, Jean Jacques: *See—*
Davidovits, Joseph; and Legrand, Jean Jacques, 4,028,454.

Le Houezec, Roger: *See—*
Sureau, Claude; Tournaire, Michel; Zorn, Jean-Rene; Sturbois, Gilbert; Chavinie, Jacques; Le Houezec, Roger; and Ripoche, Andre, 4,027,657.

Leonard, William J.: *See—*
Dale, James A.; and Leonard, William J., 4,028,342.

Leonhart, Charles J., to Nuarc Company, Inc. Apparatus for laminating sheet material. 4,028,166, Cl. 156-382.000.

Le Roux, Herve: *See—*
Naudy, Rene; Phoyu, Francois; Robert, Louis; Legousse, Maurice; Audouard, Jean-Marie; and Le Roux, Herve, 4,028,049.

Letchworth, Peter E.: *See—*
Baker, Don R.; Walker, Francis H.; and Letchworth, Peter E., 4,028,411.

Leveque, Jean-Luc: *See—*
Boudouris, Georges; Kalopissis, Gregoire; Leveque, Jean-Luc; and Roussopoulos, Paul, 4,028,518.

Levine, Arnold M., to International Telephone and Telegraph Corporatioo. Fiber optic phased array antenna system for RF transmission. 4,028,702, Cl. 343-100.0SA.

Levine, Leon: *See—*
King, Alan G.; and Levine, Leon, 4,028,325.

Levine, Richard F.: *See—*
Collins, Robert Henry; Levine, Richard F.; North, William D.; O'Rourke, Gerald D.; and Parker, Gerald R., 4,028,150.

Levine, Robert Aaron: *See—*
Wardlaw, Stephen Clark; Levine, Robert Aaron; and Massey, James Vincent, III, 4,027,660.

Levinson, Sidney Harry; and Mendelson, Wilford Lee, to SmithKline Corporation. Novel preparation of trifluoromethylthioacetic acid. 4,028,408, Cl. 260-539.00R.

Lewin, Nathan; and Wong, Emmy Tong-In, to Bio-Rad Laboratories. Assay method for serum folate. 4,028,465, Cl. 424-1.000.

Lewis, Adolph L., to United States of America, Navy. Fiber optic cable connector. 4,027,938, Cl. 350-96.00C.

Lewis, David L.; Franks, C. Richard; and Schenker, Barry A., to Diamond Shamrock Corporation. Manganese dioxide electrode. 4,028,215, Cl. 204-290.00F.

Lewis, Edgar B., to Grumman Aerospace Corporation. High-resolution vision system. 4,028,725, Cl. 358-103.000.

LFE Corporation: *See—*
Jacob, Adir, 4,028,155.

Li, Tsi Tieh; and Saxon, Robert, to American Cyanamid Company. Vulcanizable elastomers derived from thiodiethanol. 4,028,305, Cl. 260-75.00S.

Libbey-Owens-Ford Company: *See—*
Rehrig, Donald D.; and Revells, Robert G., 4,028,086.

Liberman, Arthur L.: *See—*
Ouwerkerk, Anton Van; Chant, Bernard J.; and Liberman, Arthur L., 4,028,279.

Liberty Carton Co.: *See—*
Stoll, Mark Steven, 4,027,818.

Lind, Earl V., to Schlegel Corporation. Method of extruding a weatherstrip having a pile strip. 4,028,456, Cl. 264-90.000.

Linde Aktiengesellschaft: *See—*
Menssen, Ernst, 4,028,026.

Lindmayer, Joseph, to Solarex Corporation. Method of impregnating a semiconductor with a diffusant and article so formed. 4,028,151, Cl. 148-189.000.

Lindvay, Michael W., to Velsicol Chemical Corporation. Flame retardant polymeric compositions containing melamine hydrohalides. 4,028,333, Cl. 260-45.8NT.

Linnert, Peter J., to Trane Company, The. Valve plate having improved suction gas flow path. 4,027,853, Cl. 251-361.000.

Linning, George F.: *See—*
Bullard, Robert G.; Plunkett, James P.; and Linning, George F., 4,028,654.

Lion Fat & Oil Co., Ltd.: *See—*
Okumura, Osamu; Sakatani, Takenobu; Yamane, Izumi; and Kashiwada, Toshinobu, 4,028,282.

Liotta, Charles L.; and Muzzy, John D. 6-Fluoro-9-perfluorobutyl purine. 4,028,358, Cl. 260-254.000.

Lipa Lizenz-und Patentverwertungs-ansalt: *See—*
Dischinger, Gebhard, 4,027,371.

Lipp, Charles E.; and Young, Teddy R., to Caterpillar Tractor Co. Method of and apparatus for semi-automatic assembly of track-type chain. 4,027,471, Cl. 59-7.000.

Lippsmeier, Bernd; Hestermann, Klaus; and Reuter, Martin, to Hoechst Aktiengesellschaft. Production of tertiary (hydroxymethyl)-methylphosphine oxides. 4,028,421, Cl. 260-606.50P.

Lips B.V.: *See—*
Wind, Jaap, 4,028,004.

Litt, Morton H.; and Kumar, Narayan Ganesh, to International Playtex, Inc. Cellulose solutions and products prepared therefrom. 4,028,132, Cl. 106-163.00R.

Litton Business Systems, Inc.: *See—*
Goldman, Myron D., 4,027,585.

Liu, Hsing-ching; and Liu, Lan-dih. Novel educational toy. 4,027,402, Cl. 35-9.00R.

Liu, Lan-dih: *See—*
Liu, Hsing-ching; and Liu, Lan-dih, 4,027,402.

Livingston, Richard Donnan; and Sauerbrunn, Robert Dewey, to Du Pont de Nemours, E. I., and Company. Distillation apparatus. 4,028,443, Cl. 261-114.0TC.

Ljunggren, Knut Lennart: *See—*
Christell, Adolf Ragnar Roland Umberto Einarsson; Koski, Kaijo Aatto Matias; and Ljunggren, Knut Lennart, 4,028,267.

Llach, Lorenzo; and Picas, Arturo, to Canton Textile Mills, Inc. Variable speed drive system for carding machine. 4,027,358, Cl. 19-106.00R.

Lloyd, Donald R.: *See—*
Van Doorn, Donald W.; and Lloyd, Donald R., 4,027,537.

Lobb, Daniel Richard, to Redifon Limited. Optical systems. 4,027,949, Cl. 350-150.000.

Loeber, David Y.: *See—*
Johnson, James J.; and Loeber, David Y., 4,027,457.

Loeffler, Otto Ernest: *See—*
Langere, Ronald Francis; and Loeffler, Otto Ernest, 4,028,266.

Loesser, Ernest W., III. Compressible dispensing container having piercing prongs. 4,027,985, Cl. 401-134.000.

Loewe-Opta GmbH.: *See—*
Kraus, Heinz, 4,028,588.

Loft, John T., to Amerace Corporation. Filtration apparatus. 4,028,250, Cl. 210-259.000.

Logan, Ralph Andre; Merz, James Logan; Reinhart, Franz Karl; and White, Harry Gregory, to Bell Telephone Laboratories, Incorporated. LPE Technique for fabricating tapered optical couplers. 4,028,146, Cl. 148-171.000.

Logothetis, Eleftherios M.: *See—*
Kushida, Toshimoto; and Logothetis, Eleftherios M., 4,028,642.

Lohmann, Dieter: *See—*
Bitzer, Diethelm; and Lohmann, Dieter, 4,028,142.

Lohner, Jacques. Refuse incinerator. 4,027,603, Cl. 110-18.00R.

Long, Gregor Dean: *See—*
Heavner, Paul William, Jr.; and Long, Gregor Dean, 4,027,664.

Lonnebring, Arne, to Aktiebolaget Imo Industre. Screw pump. 4,028,025, Cl. 418-197.000.

Lonza Ltd.: *See—*
Zinsstag, Christoph; Kutschera, Heinz; and Knutti, Dietrich, 4,028,239.

Lopata, Ira. Leader-pin. 4,027,832, Cl. 242-197.000.

Lorch, Eckehard: *See—*
Fischer, Ulf; and Lorch, Eckehard, 4,028,402.

Lord Corporation: *See—*
Finney, Robert H.; and Schmidt, Warren E., 4,028,002.

L'Oreal: *See—*
Boudouris, Georges; Kalopissis, Gregoire; Leveque, Jean-Luc; and Roussopoulos, Paul, 4,028,518.

Loshaek, Samuel, to Wesley-Jessen Inc. Hydrophilic polymer and contact lens. 4,028,295, Cl. 260-29.60H.

Lourigan, George H.: *See—*
North, Bernard F.; and Lourigan, George H., 4,028,054.

Lowe, Warren: *See—*
Stayner, Robert A.; and Lowe, Warren, 4,028,143.

Loyd, J. Leslie. Removable antenna mount. 4,028,705, Cl. 343-715.000.

Lubrizol Corporatioo, The: *See—*
Forsberg, John Wesley, 4,028,226.

Luce, David A.; and Marchese, Anthony, to Norlin Music, Inc. Keyboard for an electronic musical instrument employing variable capacitors. 4,027,569, Cl. 84-1.100.

Luedtke, Arthur: *See—*
Berkowitz, Benjamin; Luedtke, Arthur; Kilpatrick, William L.; and Bentley, William F., Jr., 4,028,709.

Lummus Company, The: *See—*
Sze, Morgan C.; and Snell, George J., 4,028,221.
Tsao, Utah, 4,028,427.

Lummus Industries, Inc.: *See—*
Van Doorn, Donald W.; and Lloyd, Donald R., 4,027,537.

Lund, Norman S.; Young, George Ralph, Jr.; and Lund, Norman W. Liquid purification system. 4,028,246, Cl. 210-151.000.

Lund, Norman W.: *See—*
Lund, Norman S.; Young, George Ralph, Jr.; and Lund, Norman W., 4,028,246.

Lundell, Vernon J. Round hay baler apparatus. 4,027,465, Cl. 56-341.000.

Lundgren, Bengt G. S., to SKF Nova AB. Process for manufacturing a reinforcing material for concrete. 4,027,718, Cl. 164-46.000.

Lundin, Lars Olof, to AB Bofors. Device for co-ordinated driving of a towing vehicle and a towed vehicle. 4,027,738, Cl. 180-14.00A.

Lundstrom, Bengt, to Jungers Verkstads AB of Goteborg. Curing oven for mineral wool. 4,028,051, Cl. 432-144.000.

Luoma, Eino J.: *See—*
Connolly, Thomas M.; and Luoma, Eino J., 4,027,384.

Lupke, Gerd: *See—*
Tessler, Arthur N.; Lupke, Gerd; Lupke, Manfred; and Tobias, Myron J., 4,027,674.

Lupke, Manfred: *See—*
Tessler, Arthur N.; Lupke, Gerd; Lupke, Manfred; and Tobias, Myron J., 4,027,674.

Lyon, Warren Charles; and Hayes, William H., Jr., to Hittman Corporation. Pressure sensor. 4,027,661, Cl. 128-2.00A.

M-B-W, Inc.: *See—*
Maass, Helmut A., 4,027,991.

Maass, Helmut A., to M-B-W, Inc. Concrete finisher with retractable guard ring section. 4,027,991, Cl. 404-112.000.

MacDonald, John M.; and Kartzmark, Robert, to Exxon Research and Engineering Company. Process for the preparation of low pour point lubricating oils. 4,028,224, Cl. 208-92.000.

MacFadyen, Donald Edward, to Glyco Chemicals, Inc. Fatty and benzoic acid esters of ethoxylated hydantoins substituted or not in the 5-position. 4,028,378, Cl. 260-309.500.

MacInnes, Hugh, to Roto-Master, Inc. Partially divided turbine housing for turbochargers and the like. 4,027,994, Cl. 415-1.000.

Mackay Center Specialties, Inc.: *See—*
Mathieson, Niall, 4,027,828.

Macken, Elmer N.: *See—*
Ford, James M.; and Macken, Elmer N., 4,028,214.

Mackey, Bruce A., Jr.: *See—*
Mackey, Bruce A., Sr.; and Mackey, Bruce A., Jr., 4,027,992.

Mackey, Bruce A., Sr.; and Mackey, Bruce A., Jr. Boring tool guide device. 4,027,992, Cl. 408-97.000.

MacLeay, Ronald Edward: *See—*
Lange, Harold Carl; and MacLeay, Ronald Edward, 4,028,344.

MacMillan, Kenneth T. Retreading mold with bladder for creating annular vacuum gap. 4,028,029, Cl. 425-23.000.

Madland, Robert Christen; Zielinski, Robert Michael, Jr.; and Engstrom, Keith Allen, to Illinois Tool Works Inc. Double depression magnetic keyswitch. 4,028,696, Cl. 340-365.00L.

Maekawa, Masao: *See—*
Kakitani, Haruaki; Maekawa, Masao; and Kokubo, Takashi, 4,028,449.

Magdo, Ingrid E.: *See—*
Joy, Richard C.; Magdo, Ingrid E.; and Phillips, Alfred, Jr., 4,028,717.

Magee, Thomas A., to Diamond Shamrock Corporation. Ketoxime carbamates. 4,028,413, Cl. 260-566.0AC.

Magni, Antonio, to Axis S.p.A. Device for angularly centering a member having an annular toothed formation. 4,027,375, Cl. 29-282.000.

Maillot, Jean, to Guterman, Paulette. Electromagnetic vibration-detector device, in particular for anti-theft purposes. 4,028,567, Cl. 310-25.000.

Maillous, Louis D., to Xerox Corporation. Color transparency reproducing machine. 4,027,962, Cl. 355-4.000.

Maincent, Gabriel: *See—*
Salter, Lucien; and Maincent, Gabriel, 4,028,732.

Makolska, Hanna: *See—*
Kritchevsky, David; Koprowski, Hilary; and Makolska, Hanna, 4,028,469.

Malloy, John F., to Norton Company. Coated abrasive article containing a polyurethane adhesive splice. 4,027,435, Cl. 51-295.000.

Mamvriisky, Alexandr Sergeevich; and Lapchenko, Alexandr Mikhailovich. Method of controlling the density of a plugging fluid. 4,027,860, Cl. 259-149.000.

Manchak, Frank, Jr. Method and apparatus for treating sumps. 4,028,240, Cl. 210-59.000.

Mannesmann Aktiengesellschaft: *See—*
Pepperhoff, Werner; and Richter, Friedhelm, 4,028,098.

Mannesmannrobren-Werke AG: *See—*
Gruber, Kurt; Keim, Willi; and Hentschel, Klaus, 4,027,688.

Mansell, John Douglas, to PPG Industries, Inc. Removal of monochloroacetylene from chlorinated hydrocarbons. 4,028,426, Cl. 260-652.00P.

Manzini, Ferruccio, to Abred Establishment. Variable ratio hydraulic master-cylinder. 4,027,482, Cl. 60-574.000.

Marcatili, Enrique Alfredo Jose, to Bell Telephone Laboratories, Incorporated. Method for manufacturing helical optical fiber. 4,028,081, Cl. 65-2.000.

Marchese, Anthony: *See—*
Luce, David A.; and Marchese, Anthony, 4,027,569.

Marino, Frank, to Wooster Brush Company, The. Brush construction. 4,027,351, Cl. 15-192.000.

Marsh, David Raymond; and Osofsky, Raymond C., to Singer Company, The. Real-time simulation of point system having multidirectional points as viewed by a moving observer. 4,027,403, Cl. 35-10.200.

Marshall, Manly Ernest. Instrument for taking samples. 4,027,658, Cl. 128-2.00W.

Martin, Francois. Weatherproof decal. 4,028,474, Cl. 428-40.000.

Martin, James F. Multi-chamber muffler. 4,027,740, Cl. 181-68.000.

Martin Marietta Corporation: *See—*
Chihoski, Russell Alexander; and De Fellippie, John Charles, 4,028,522.
McClure, George F.; Endicott, John Richard; Freeman, Lionel D.; Cunningham, Marion L.; and Wells, Joel D., 4,028,500.

Martin, Robert C., to Dow Chemical Company, The. Cement composition. 4,028,125, Cl. 106-89.000.

Martin, Sam M., to Consumers Glass Company Limited. Stackable and nestable container. 4,027,796, Cl. 206-507.000.

Maruzen Oil Co. Ltd.: *See—*
Kanezaki, Kenji, 4,028,340.

Marvin Glass & Associates: *See—*
Allen, Robert K., 4,027,421.

Migitaka, Masatoshi; and Kanda, Yozo, to Hitachi, Ltd. Semiconductor Hall element. 4,028,718, Cl. 357-27.000.

Mikami, Sadao: *See—*
Kawarai, Takashi; Sawada, Yuji; Takemoto, Katsumi; and Mikami, Sadao, 4,027,823.

Mikasa, Yoshio; Nakane, Masami; and Tokura, Yukio, to Minolta Camera Kabushiki Kaisha. Copying machine control mechanism. 4,027,965, Cl. 355-13.000.

Mikulec, Richard A.: *See—*
Jones, David A., Jr.; Schlatter, James M.; Mikulec, Richard A.; Reuter, Judith A.; and Mazur, Robert H., 4,028,319.

Mikulinsky, Aron Semenovich: *See—*
Cherednichenko, Vladimir Semenovich; Orlov, Gennady Ivanovich; Mikulinsky, Aron Semenovich; Arzamastsev, Jury Semenovich; Efremkin, Vladimir Vasilievich; Nikitin, Valentin Alexeevich, deceased; Nikitina, Valentina Kuzminichna, administrator; and Nikitin, Dmitry Valentinovich, administratur, 4,027,861.

Millar, John M.; and Moran, William F., to Beatrice Foods Co. Multilayer coated substrate. 4,027,366, Cl. 428-623.000.

Millard, Ben; and Robie, Susan P., to Scott Paper Company. Metal plate treating solution. 4,028,281, Cl. 252-527.000.

Miller, Adason Morey. Method and apparatus for discharge of hot asphalt tanker. 4,027,782, Cl. 222-1.000.

Miller, Eldon D.; and Washburn, Ryan F., to Leva Crucible Refractories Company. Process for meking refractory shapes. 4,028,453, Cl. 264-67.000.

Miller, Frederick A., to Circon Corporation. Vidicon camera for closed circuit television system. 4,028,730, Cl. 358-217.000.

Miller, Jimmy L.; and Schnell, William J., to Baxter Laboratories, Inc. Dialyzer connector system. 4,028,253, Cl. 210-321.00B.

Miller, Walter E., Jr.; and Duke, Jimmy R., to United States of America, Army. Optical tracking link utiliziog pulse burst modulatien for solid state missile beacoos. 4,027,837, Cl. 244-3.160.

Miller, Wayne L.; and Carnicelli, Ernest J., to Cessna Aircraft Company, The. DME apparatus and method. 4,028,698, Cl. 343-6.5LC.

Milliken Research Corporation: *See—*
Jeter, Sheldon M., 4,027,792.

Millis, Edwin Graham: *See—*
Shortes, Samuel R.; and Millis, Edwin Graham, 4,027,686.

Mills, Edgar C.: *See—*
Mehaffey, Joseph H.; Mills, Edgar C.; and Ivester, J. Harold, 4,028,498.

Milstein Medical Research Foundation, Inc.: *See—*
Lee, Arnold S. J., 4,027,662.

Minakuchi, Hiroshi: *See—*
Tokuda, Kazuo; Tsugita, Masanobu; and Minakuchi, Hiroshi, 4,028,602.

Minami, Teruo: *See—*
Ito, Terukazu; Nakao, Kiyoharu; Minami, Teruo; and Uenoyama, Masaru, 4,027,554.

Minnesota Mining and Manufacturing Company: *See—*
Knapp, Philip B., 4,027,606.

Minolta Camera Kabushiki Kaisha: *See—*
Mikasa, Yoshio; Nakane, Masami; and Tokura, Yukio, 4,027,965.

Mio, Mitushi. Method for forming a casting mold and a flexible pattern to be used therefor. 4,027,717, Cl. 164-44.000.

Mira-Pak, Inc.: *See—*
Leasure, William; Garcia, Luis; Reifel, Charles; and Shelton, Jack, 4,027,579.

Mirrex, Incorporated: *See—*
Cummins, James M., 4,027,548.

Mischke, Peter: *See—*
Fleckenstein, Erwin; and Mischke, Peter, 4,028,321.

Misek, Victor A., to Sanders Associates, Inc. Method and apparatus for passive optical fusing and distance measurement. 4,027,970, Cl. 356-4.000.

Miskeen, Lester; and Christopolous, John, to Singer Company, The. Circular knitting machine with disengaging positive yarn feeding means. 4,027,505, Cl. 66-125.00R.

Mishima, Kyoichi: *See—*
Matsuo, Tadao; Miura, Minoru; Mashimo, Satoshi; Kakei, Masanori; and Mishima, Kyoichi, 4,028,316.

Misu, Hiroshi: *See—*
Iwasaki, Masayuki; Misu, Hiroshi; and Miyano, Shizuo, 4,028,111.

Mitchell, Gordon Charles. Seal emplacement tools. 4,027,372, Cl. 29-235.000.

Mitsubishi Belting Limited: *See—*
Matsuo, Tadao; Miura, Minoru; Mashimo, Satoshi; Kakei, Masanori; and Mishima, Kyoichi, 4,028,316.

Mitsubishi Denki Kabushiki Kaisha: *See—*
Kobayashi, Gai; Shikano, Yoshiro; and Yano, Masao, 4,027,728.
Shikano, Yoshiro; and Ueoka, Yasuhiro, 4,028,723.
Watanabe, Eiki, 4,027,745.

Mitsubishi Jukngyo Kabushiki Kaisha: *See—*
Kawarai, Takashi; Sawada, Yuji; Takemoto, Katsumi; and Mikami, Sadao, 4,027,823.
Ueda, Shoji; Ono, Shuzi; Sakaguchi, Hiroshi; and Tsunoda, Hideo, 4,028,455.

Mitsubishi Monsanto Chemical Company: *See—*
Kekitani, Haruaki; Maekawa, Masao; and Kokubo, Takashi, 4,028,449.

Mitsui Mining & Smelting Co., Ltd.: *See—*
Hirakawa, Seishiro; Kanai, Shyuji; Ikeda, Matsuo; and Hirata, Toshinori, 4,028,211.
Sakai, Toshiyuki; Matsuo, Koichi; and Tochio, Yukihiro, 4,028,275.

Mitsui Petrochemical Industries, Ltd.: *See—*
Yamada, Koichi; Morimoto, Teijiro; and Yoshioka, Yoshioki, 4,028,119.

Mitsui Toatsu Chemicals, Incorporated: *See—*
Shiomura, Tetsunosuke; Ito, Akiro; Morimoto, Yoshio; and Iwao, Tetsuya, 4,028,481.

Mittleman, Herbert, to Baxter Travenol Laboratories, Inc. Flexible hanger member for drainage bags and the like. 4,027,842, Cl. 248-75.000.

Miura, Minoru: *See—*
Matsuo, Tadao; Miura, Minoru; Mashimo, Satoshi; Kakei, Masanori; and Mishima, Kyoichi, 4,028,316.

Miyano, Shizuo: *See—*
Iwasaki, Masayuki; Misu, Hiroshi; and Miyano, Shizuo, 4,028,111.

Miyazaki, Toru, to Alps Motorola, Inc. Head indexing apparatus for a combined two and four channel tape player/recorder. 4,028,735, Cl. 360-106.000.

Miyazawa, Kuichiro: *See—*
Yamaura, Yoshitomo; Kobayashi, Takayoshi; Asanuma, Akira; and Miyazawa, Kuichiro, 4,028,510.

Mizunuma, Takeji: *See—*
Hayashi, Kazuya; Mizunuma, Takeji; and Yokotsuka, Tamotsu, 4,028,470.

Mizutani, Yoshiyuki; Tada, Masaaki; and Imada, Yasuo, to Kabushiki Kaisha Toyota Chuo Kenkyusho. Self-lubricating iron base alloy. 4,028,097, Cl. 75-123.0AA.

Moat, Nicholas Warrington, to Edwin Cooper & Company Limited. Corrosion inhibitors. 4,028,117, Cl. 106-14.000.

Moberg, Lars-Goran: *See—*
Gustavsson, Varne Axel Gerhard; and Moberg, Lars-Goran, 4,027,758.

Mobil Oil Corporation: *See—*
Brown, George L.; and Tobias, Michael A., 4,028,294.
Guenther, Robert O.; Huffhines, Donald F.; Krall, James W.; and Ray, Charles D., 4,027,616.
Herd, Richard S.; and Otto, Ferdinand P., 4,028,259.
Poloso, Anthony; and Murray, James Gordon, 4,028,485.

Mochizuki, Kiyoshi: *See—*
Togo, Masaaki; Shima, Masao; and Mochizuki, Kiyoshi, 4,028,604.

Moder, Helmut, to Robert Bosch G.m.b.H. Control apparatus for starting internal combustion engines. 4,027,641, Cl. 123-179.00L.

Moede, Earl J., to McNeill Favia Co. Clip for retaining a canvas stretcher frame in a decorative picture frame. 4,027,413, Cl. 40-156.000.

Moffett, Robert Bruce, to Upjohn Company, The. Triazinobenzodiazepines. 4,028,356, Cl. 260-248.0AS.

Moll, Dean H.; and Greiner, Alan, to Singer Company, The. Balancing system for a rotating mass. 4,028,524, Cl. 219-121.00L.

Mominee, David E.; and Vance, Gilbert W., to Reed Irrigation Systems. Apparatus for creating holes in flexible members. 4,028,525, Cl. 219-121.00L.

Monahan, Earnest M.; and Patterson, Garvin W., to Honeywell Information Systems, Inc. Apparatus for dispatching data of the highest priority process having the highest priority channel to a processor. 4,028,664, Cl. 340-172.500.

Monsanto Company: *See—*
Higginbottom, Harold P., 4,028,367.
King, Henry L., 4,028,330.
Tyssee, Donald Armon, 4,028,201.

Monsky, Jeffrey N.; and Combs, Glen, to McMiah Corporation, The. Inflatable building. 4,027,437, Cl. 52-2.000.

Montagut, Jose Salvador. Process and apparatus for the continuous obtainment hy displacement of cylindrical or prismatic hollow bodies produced with fibre-reinforced synthetic resins. 4,028,164, Cl. 156-173.000.

Mooradian, Aram: *See—*
Alexander, Ernest John; and Mooradian, Aram, 4,028,382.

Moore, Earl Phillip, Jr., to Du Pont de Nemours, E. I., and Company. Process for the preparation of azodinitriles from aminonitriles in the presence of a surfactant. 4,028,345, Cl. 260-192.000.

Moore, Ernest George: *See—*
Jelling, Murray; Kahn, Alexander; Moore, Ernest George; and Friedmao, Michael, 4,027,461.

Moore, Harlan D.: *See—*
Bowen, Woodrow L.; and Moore, Harlan D., 4,028,212.

Moore, Robert F.: *See—*
Schulman, Joseph H.; and Moore, Robert F., 4,027,677.

Moorman, James H., Jr., to Blue Bird Body Company (Entire). Wheelchair holding device for vehicles. 4,027,747, Cl. 188-28.000.

Moran, John Christian, to Bell Telephone Laboratories, Incorporated. Memory patching circuit. 4,028,678, Cl. 340-172.500.

Moran, John Christian: *See—*
Divine, Charles Hamman; and Moran, John Christian, 4,028,684.

Moran, William F.: *See—*
Millar, John M.; and Moran, William F., 4,027,366.

Morantz, Herbert; and Morantz, Stanley. Drapery length marking device. 4,027,394, Cl. 33-18.00R.

Morantz, Stanley: *See—*
Morantz, Herbert; and Morantz, Stanley, 4,027,394.

Moravcsik, Imre: *See—*
Bite, Pal; Moravcsik, Imre; Schafer, Inge; Horvath, Gyula; Mehesfalvi nee Vajna, Zsuzsanna; Borvendeg, Janos; and Hermann nee Szente, Ilona, 4,028,348.

Moreau, Marc, to Trefimetaux. Device for continuous extrusion. 4,027,514, Cl. 72-60.000.

Moreland, Stephen T. Manufacture of filled capsules or the like. 4,028,024, Cl. 425-133.100.

Mori, Ikuo; and Shimizu, Yoshiyuki, to Nippon Kogaku K.K. Parfocal low-magnification microscope objective lens systems. 4,027,951, Cl. 350-175.0ML.

Mori, Shigejiro; Uchikawa, Hiroshi; and Uchida, Shunichiro, to Onoda Cement Company, Ltd. Process for manufacturing rapid hardening portland cement clinker. 4,028,126, Cl. 106-100.000.

Moricca, Larry S.; and Zaker, Gregory A., to Inventive Industries, Inc. Apparatus for adapting multi-line telephone instrument for use by the blind. 4,028,502, Cl. 179-99.000.

Morimoto, Teijiro: *See—*
Yamada, Koichi; Morimoto, Teijiro; and Yoshioka, Yoshioki, 4,028,119.

Morimoto, Yoshio: *See—*
Shiomura, Tetsunosuke; Ito, Akiro; Morimoto, Yoshio; and Iwao, Tetsuya, 4,028,481.

Morimoto, Yutaka: *See—*
Uchii, Jiro; Kodo, Masatsugu; Soga, Tsunehiko; and Morimoto, Yutaka, 4,028,070.

Morita, Masayuki: *See—*
Shimogawa, Toshiaki; Morita, Masayuki; and Kawaharazaki, Takashi, 4,027,905.

Moriya, Hisanori; and Osawa, Tadao, to Hitachi, Ltd. Exhaust gas recirculation device. 4,027,638, Cl. 123-119.00A.

Moriya, Kunitoshi: *See—*
Suzuki, Masao; and Moriya, Kunitoshi, 4,028,666.

Moriyama, Akio; Fukai, Masakazu; Tatsuta, Hiroshi; Takahashi, Hiroaki; and Esaki, Hiroshi, to Matsushite Electric Industrial Co., Ltd. Electro-optical display device. 4,027,950, Cl. 350-160.0LC.

Morris, Florin V., to Caywood, Howard E., a part interest. Collapsible dressing hook for animals. 4,027,357, Cl. 17-44.000.

Morris, Livingston B., to Extracorporeal Medical Specialties Inc. Accordion fold flat plate dialyzer. 4,028,252, Cl. 210-321.00B.

Morrison, Howard J.; and Keller, Albert G. Sound actuated figure toys. 4,027,425, Cl. 46-264.000.

Mortimer, Thomas J., to Sanders Associates, Inc. Fager subsystems. 4,028,661, Cl. 340-324.00M.

Morton, Avery A.; and Lanpher, Edward J. Alfin polymerized rubber. 4,028,484, Cl. 526-335.000.

Morton-Norwich Products, Inc.: *See—*
Fessler, Dyrel C.; Heavner, George A.; and Massey, Thomas H., 4,028,401.
Pelosi, Stanford Salvatore, Jr.; and Alaimo, Robert James, 4,028,374.
Schwan, Thomas J., 4,028,359.

Mory, Rudolf, to Ciba-Geigy Corporation. 6-Methylbenzimidazolonylazobarbituric acid pigment. 4,028,322, Cl. 260-154.000.

Mos, Robert J., to American Magnetics Corporation. Plural megnetic head assembly with independently supporting structure. 4,028,734, Cl. 360-104.000.

Moser, Willard W. Tie down brackets for securing bights of flexible members. 4,027,360, Cl. 24-146.000.

Moslener, Jorn: *See—*
Elsner, Wolfgang; Moslener, Jorn; and Langenstuck, Alfons, 4,027,565.

Motley, David M.; and Cheng, King Y., to Hycom Incorporated. Digital data receiver with automatic timing recovery and control. 4,028,626, Cl. 325-324.000.

Motorola, Inc.: *See—*
Bainter, James R., 4,028,560.
Cho, Susumu; Erickson, Paul Milton; and Null, Michael William, 4,028,627.
Helda, Robert W., 4,028,722.
Leach, George S., Jr., 4,028,671.

Motoyama, Shimesu, to Freund Industrial Co., Ltd. Fluid granulating-/coating apparatus utilizing suction air current. 4,027,624, Cl. 118-303.000.

Mott, James R. Combustion system. 4,027,602, Cl. 110-7.00R.

Mounton, William J., Jr. Self-equalizing linkage for well derricks. 4,027,854, Cl. 254-29.00R.

Mueller, Floyd F., to American Hospital Supply Corporation. Combination safety stop and down lock for folding tables. 4,027,600, Cl. 108-113.000.

Mueller, Siegfried. Permanent-wave or water-wave curler. 4,027,684, Cl. 132-40.000.

Mugnier, Robert: *See—*
Labedan, Pierre; Mugnier, Robert; and Chavanel, Hubert, 4,028,209.

Mukai, Kunio: *See—*
Tsuchiya, Hiroshi; Mukai, Kunio; Kimura, Akio; Taya, Hiroshi; Fujimoto, Keimei; Ozaki, Toshiaki; Yamamoto, Sigeo; Ogawa, Teizo; Ooishi, Tadashi; and Okuno, Yositosi, 4,028,438.

Mukaida, Yutaka: *See—*
Enomoto, Satoru; Takita, Hitoshi; Wada, Hisayuki; Mukaida, Yutaka; and Yanaka, Mikiro, 4,028,387.

Mull, Richard T., to Great Lakes Carbon Corporation. Method and apparatus for determining the relative roughness of holes in refractory compositions. 4,027,525, Cl. 73-37.000.

Muller, Fritz. Valve for aggressive fluids. 4,027,849, Cl. 251-30.000.

Muller, Hans-Jurgen: *See—*
Schafer, Walter; Wagner, Kuno; and Muller, Hans-Jurgen, 4,028,310.

Muller, Marcel: *See—*
Alig, Leo; Furst, Andor; Keller, Peter; Muller, Marcel; Kerb, Ulrich; and Wiechert, Rudolf, 4,028,400.

Muller, Peter; Wagner, Kuno; and Muller, Richard, to Bayer Aktiengesellschaft. Process for the production of water-dispersible polyhydroxyl compounds. 4,028,313, Cl. 260-77.5AP.

Muller, Richard: *See—*
Muller, Peter; Wagner, Kuno; and Muller, Richard, 4,028,313.

Muller, Werner Heinrich; and Weil, Tomas, to Hoechst Aktiengesellschaft. Process for the manufacture of cyclohexandione-1,3. 4,028,417, Cl. 260-586.00C.

Mundil, Waldemar Dietmar, to Deutsche Vergaser GmbH & Co Kommanditgesellscheft. Thermally controlled fluid flow regulating or shut-off valves. 4,027,848, Cl. 251-11.000.

Murai, Masaaki: *See—*
Funamo, Hiroshi; Kunihiro, Toshiro; and Murai, Masaaki, 4,028,495.

Murakami, Hiroyashu: *See—*
Kawamura, Masaharu; Sakurada, Nobuaki; Shinoda, Nobuhiko; Ito, Tadashi; Ito, Fumio; and Murakami, Hiroyashu, 4,028,712.

Murakami, Noboru; Hirosawa, Koichiro; Ohara, Kazuo; and Matsuo, Koichi, to Aisin Seiki Kabushiki Kaisha. Speed change gear system. 4,027,551, Cl. 74-759.000.

Murakami, Noboru; Hirosawa, Koichiro; Ohara, Kazuo; and Matsuo, Koichi, to Aisin Seiki Kabushiki Kaisha. Speed change gear system. 4,027,552, Cl. 74-765.000.

Murata Manufacturing Co., Ltd.: *See—*
Nakamura, Takeshi, 4,028,640.
Wakino, Kikuo; Nishikawa, Toshio; Tamura, Sadahiro; and Ishikawa, Youhei, 4,028,652.

Murata, Moriyasu; Sai, Fumio; and Fujino, Takashi, to Kao Soap Co., Ltd. Non-phosphete or reduced phosphate detergent compositions containing mixtures of alkyl ether sulfates. 4,028,280, Cl. 252-526.000.

Murata, Moriyasu; Sai, Fumio; and Fujino, Takashi, to Kao Soap Co., Ltd. Granular or powdery detergent composition. 4,028,283, Cl. 252-551.000.

Murauskas, Donald J.; Kish, Edward E., Jr.; Cunningham, Frank M.; Gallagher, Bernard J.; and Shufflebarger, Earl D., to Nupro Company. Fluid filter. 4,028,248, Cl. 210-232.000.

Murrey, James Gordon: *See—*
Poloso, Anthony; and Murray, James Gordon, 4,028,485.

Muzzy, John D.: *See—*
Liotta, Charles L.; and Muzzy, John D., 4,028,358.

Mygatt, Leonard T., Jr.; and Goldsmith, Edward E., to National Packaging Associates Corporation. Tamper-indicating container and lid therefor. 4,027,775, Cl. 220-266.000.

Myren, Harry Ingemar, to Aktiebolaget Karlstads Mekaniske Werkstad. Apparatus for collecting liquids thrown from a moving member. 4,028,174, Cl. 162-264.000.

N-S-W Corporation: *See—*
Parker, Kenneth Wade, 4,027,560.

Nagano, Masashi, to Shimano Industrial Company, Limited. Derailleur for bicycle. 4,027,542, Cl. 74-217.00B.

Nagao, Kameji: *See—*
Sera, Hidefumi; Nagao, Kameji; and Ishii, Tsumoru, 4,028,320.

Nagata, Takashi: *See—*
Ikushima, Hirosbi; Nakajima, Yasuo; Hagiwara, Kitokazu; and Nagata, Takashi, 4,028,646.

Nagayoshi, Konno, to Koritsu Kikaikogyo Co., Ltd. Coke oven door. 4,028,193, Cl. 202-248.000.

Nagoshi, Kazuo: *See—*
Fukushima, Osamu; Nagoshi, Kazuo; and Iwamoto, Toshiaki, 4,028,161.

Nail, Nelson R.: *See—*
Lamberts, Robert L.; and Nail, Nelson R., 4,028,109.

Nakajima, Shigeo: *See—*
Hujimori, Masao; Nakajima, Shigeo; Takahashi, Ken; Ito, Tsunetoshi; Shimada, Toshio; and Endo, Hajime, 4,027,918.

Needham, Donald G.; Taylor, Kenneth P.; and Brown, Claude V., to Phillips Petroleum Company. Stabilization of cross-linked polyolefins. 4,028,332, Cl. 260-45.80R.

Nelson, David M., to Ambac Industries, Inc. Gas analyzer. 4,028,057, Cl. 23-254.00E.

Nelson, James P., to Standard Oil Company (Indiana). Poly(cyclohexanedimethylene dibromoterephthalate). 4,028,308, Cl. 260-75.00H.

Nelson, Norman A., to Upjoin Company, The. 2-Decarboxy-2-hydroxymethyl-cis-4,5-didehydro-PGE, compounds. 4,028,419, Cl. 260-586.00R.

Nemoto, Hideo; and Koike, Yuuji, to Kabushiki Kaisha Daini Seikosha. Connector having electro-conductive rubber terminal. 4,027,936, Cl. 339-59.00M.

Neri, Joseph Dominic; and Williams, John Lewis, to Burroughs Corporation. Ink transfer member. 4,028,286, Cl. 260-2.50P.

Nestler, Heinz: *See—*
Amort, Jurgen; and Nestler, Heinz, 4,028,343.

Neuzil, Richard W.; and Rosback, Donald H., to Universal Oil Products Company. Process for the separation of ethylbenzene. 4,028,428, Cl. 260-674.0SA.

Newell, Dennis E., to Robertshaw Controls Company. Motor control circuit. 4,028,593, Cl. 361-27.000.

Neyret, Guy, to Genoud & Cie. Cigarette lighter with presale tamper protection. 4,028,043, Cl. 431-144.000.

Ngo, Peter Dinh-Tuan, to Bell Telephone Laboratories, Incorporated. Liquid crystal display device. 4,028,692, Cl. 340-324.00M.

Niagara Machine & Tool Works: *See—*
Jones, Clarence O., Jr., 4,027,567.

Nickerson, David L., to Korfil, Incorporated. Insulated block. 4,027,445, Cl. 52-405.000.

Nickols, Richard C., Jr.: *See—*
Tuschner, Jerome G.; and Nickols, Richard C., Jr., 4,028,324.

Nicou, Parasko: *See—*
Dumoulin, Jean; and Nicou, Parasko, 4,028,298.

Niemeyer, Willy; and Simon, Helmut, to Windmoller & Holscher. Apparatus for applying contact pressure to packs of tube sections. 4,027,871, Cl. 271-95.000.

Nieskens, Antonius; Slenders, Petrus; and Palmkoeck, Christian, to Robert Bosch G.m.b.H. Sealing machine. 4,027,459, Cl. 53-59.00R.

Niikura, Masakatsu, to Janome Sewing Machine Co. Ltd. Intermittent stitching device for sewing machines. 4,027,610, Cl. 112-275.000.

Niiro, Yasuhiko, to Kokusai Denshin Denwa Kabushiki Kaisha. System equalization for repeatered submarine cable system. 4,028,644, Cl. 333-16.000.

Nikitin, Dmitry Valentinovich, administrator: *See—*
Cherednichenko, Vladimir Semenovich; Orlov, Gennady Ivanovich; Mikulinsky, Aron Semenovich; Arzamastsev, Jury Semenovich; Efremkin, Vladimir Vasilievich; Nikitin, Valentin Alexeevich, deceased; Nikitina, Valentina Kuzminichna, administrator; and Nikitin, Dmitry Valentinovich, administrator, 4,027,861.

Nikitin, Valentin Alexeevich, deceased: *See—*
Cherednichenko, Vladimir Semenovich; Orlov, Gennady Ivanovich; Mikulinsky, Aron Semenovich; Arzamastsev, Jury Semenovich; Efremkin, Vladimir Vasilievich; Nikitin, Valentin Alexeevich, deceased; Nikitina, Valentina Kuzminichna, administrator; and Nikitin, Dmitry Valentinovich, administrator, 4,027,861.

Nikitina, Valentina Kuzminichna, administrator: *See—*
Cherednichenko, Vladimir Semenovich; Orlov, Gennady Ivanovich; Mikulinsky, Aron Semenovich; Arzamastsev, Jury Semenovich; Efremkin, Vladimir Vasilievich; Nikitin, Valentin Alexeevich, deceased; Nikitina, Valentina Kuzminichna, administrator; and Nikitin, Dmitry Valentinovich, administrator, 4,027,861.

Nippon Electric Company, Ltd.: *See—*
Araseki, Takashi; and Ochiai, Kazuo, 4,028,506.
Funamo, Hiroshi; Kunihiro, Toshiro; and Murai, Masaaki, 4,028,495.
Saburi, Akio, 4,028,497.
Shutoh, Masamichi, 4,028,584.
Tokuda, Kazuo; Tsugita, Masanobu; and Minakuchi, Hiroshi, 4,028,602.

Nippon Hoso Kyokai: *See—*
Konishi, Yoshihiro; Konno, Kenichi; Yazawa, Norihiko; and Hoshino, Norio, 4,028,650.

Nippon Kogaku K.K.: *See—*
Mori, Ikuo; and Shimizu, Yoshiyuki, 4,027,951.

Nippon Kokan Kabushiki Kaisha: *See—*
Kawawa, Takaho; and Ito, Masaharu, 4,027,844.
Yamamoto, Tomio; Sakasegawa, Koji; Osumi, Atsushi; Hosaka, Yukio; and Yamada, Takeo, 4,027,978.

Nippon Oil Company Ltd.: *See—*
Tsuchiya, Shozo; Sato, Hisatake; Oshima, Akio; and Hayashi, Hideo, 4,028,291.

Nippon Shokubai Kagaku Kogyo Co., Ltd.: *See—*
Uchii, Jiro; Kodo, Masatsugu; Soga, Tsunehiko; and Morimoto, Yutaka, 4,028,070.

Nippon Soken, Inc.: *See—*
Kitagawa, Junji; and Akita, Sigeyuki, 4,028,620.
Shimogawa, Toshiaki; Morita, Masayuki; and Kawaharazaki, Takashi, 4,027,905.

Nippon Telegraph and Telephone Public Corporation: *See—*
Horikoshi, Yoshiji, 4,028,148.
Tomishima, Hiroshi; Takahashi, Toshio; Ono, Kenichi; and Kumasaka, Kazuhiro, 4,028,144.

Nippondenso Co., Ltd.: *See—*
Arai, Hiroshi; Nakamura, Akira; Sugiura, Akio; Okamoto, Atutoshi; and Toyama, Koichi, 4,027,926.

Nishi, Nobuji: *See—*
Matsuura, Mikio; Nishi, Nobuji; Matsuoka, Michio; and Masuyama, Takeshi, 4,028,277.

Nishida, Takashi: *See—*
Fujita, Yoshiji; Omura, Yoshiaki; Nishida, Takashi; and Itoi, Kazuo, 4,028,385.

Nishikawa, Toshio: *See—*
Wakino, Kikuo; Nishikawa, Toshio; Tamura, Sadahiro; and Ishikawa, Youhei, 4,028,652.

Nishimura, Shigeoki; Sawa, Toshio; Otani, Kouji; and Kikkawa, Seiichi, to Hitachi, Ltd. Method and apparatus for treatment of fluorine-containing waste waters. 4,028,237, Cl. 210-45.000.

Nishioka, Matsuo, to Matsushita Electric Industrial Co., Ltd. Electronic component having a fine adjustment mechanism. 4,027,541, Cl. 74-10.540.

Nishiwaki, Kiyoshi: *See—*
Nakamura, Hiroyuki; Kawaguchi, Hiroshi; and Nishiwaki, Kiyoshi, 4,028,658.

Nissan Motor Co., Ltd.: *See—*
Aono, Shigeo, 4,027,637.
Hirashima, Kenzo; Tsujimura, Harutoshi; Hasegawa, Akira; Tanigami, Takahiko; and Ushiku, Kenichi, 4,028,516.
Masaki, Kenji; and Tokura, Naomi, 4,027,478.
Otsubo, Kizuku; Suyama, Toru; and Udagawa, Masanori, 4,027,633.
Saito, Yuichi, 4,027,923.
Takeuchi, Hiroshi; Ishizawa, Toshitugu; Yamano, Tetuyuki; Chiba, Ko; and Kobayashi, Daisaku, 4,028,022.
Yamamoto, Tadahiro; and Yoneda, Kenji, 4,027,636.

Nixon, C. Bart: *See—*
Sapp, Lawrence G.; Slappey, James F.; and Nixon, C. Bart, 4,027,599.

NL Industries, Inc.: *See—*
Langere, Rooald Francis; and Loeffler, Otto Ernest, 4,028,266.

Noguchi, Yasuhiro: *See—*
Suzuki, Nobuo; Noguchi, Yasuhiro; and Masuda, Takao, 4,028,129.

Nolley, John P., Jr.; and Kunesh, John G., to UOP Inc. Purification and drying of hydrocarbon streams with adsorbents. 4,028,069, Cl. 55-33.000.

Nomura, Chifuru, to Kitazawa Shoji Kabushiki Kaisha. Pump or motor having sealed chambers. 4,027,576, Cl. 91-339.000.

Nomura, Toshio: *See—*
Hirosawa, Yoshiaki; Nomura, Toshio; and Iiyama, Masabiko, 4,027,640.

Norden, Alexander R. Electrical terminal blocks. 4,027,937, Cl. 339-66.00M.

Nordgren, Robert: *See—*
Maske, Fred John; and Nordgren, Robert, 4,028,127.

Norlin Music, Inc.: *See—*
Luce, David A.; and Merchese, Anthony, 4,027,569.
Rendell, Stanley E.; and Schneider, Richard, 4,027,570.

Norris, Alan H., to Champion International Corporation. Resin reclamation in carpet manufacture. 4,028,159, Cl. 156-94.000.

North, Bernard F.; and Lourigan, George H., to Sun Chemical Corporation. Permanent-press system. 4,028,054, Cl. 8-185.000.

North, William D.: *See—*
Collins, Robert Henry; Levine, Richard F.; North, William D.; O'Rourke, Gerald D.; and Parker, Gerald R., 4,028,150.

Northern Electric Company Limited: *See—*
Rittenhouse, Dennis Edwin, 4,028,501.

Northern Telecom Limited: *See—*
Yee, Henry Kai-Hen, 4,028,647.

Northrop Corporation: *See—*
Curtis, Orlie L., 4,028,719.

Norton Company: *See—*
Malloy, John F., 4,027,435.

Huschka, Hans; Schmutz, Hermann; and Vygen, Peter, 4,028,181.

Null, Michael William: *See—*
Cho, Susumu; Erickson, Paul Milton; and Null, Michael William, 4,028,627.

Nupro Company: *See—*
Murauskas, Donald J.; Kish, Edward E., Jr.; Cunningbam, Frank M.; Gallagher, Bernard J.; and Shufflebarger, Earl D., 4,028,248.
Shufflebarger, Earl D.; Kish, Edward E.; Boylan, John R.; Diebl, George D.; Gallagher, Bernard J.; and Tobbe, William P., 4,028,254.

N.V. Spiro Research: *See—*
Roffelsen, Franciscus, 4,027,691.

O. M. Scott & Sons Company, The: *See—*
Bell, Robert Joseph; and Simmons, James Almy, 4,028,464.

Oakley, Thomas J. Betting device. 4,027,884, Cl. 273-148.00R.

Oberg, Karl: *See—*
Fagerhaug, Bjorn; and Oberg, Karl, 4,028,189.

Oberhardt, Bruce J.: *See—*
Snyder, Lloyd R.; Oberhardt, Bruce J.; and Olich, Jack, 4,028,056.

O'Brien, Paul John, to United States of America, Transportation. Power interrupt test equipment. 4,028,555, Cl. 361-76.000.

Occidental Petroleum Corporation: *See—*
Bartel, William J.; and Burton, Robert S., III, 4,027,917.
Wahl, Edward F., III, 4,027,483.

Ochiai, Kazuo: *See—*
Araseki, Takashi; and Ochiai, Kazuo, 4,028,506.

Ochodnicky, Samuel Steven; and Bianchi, Frank Josepb, Jr., to Gem Rad, Inc. Viscometer system. 4,027,516, Cl. 73-57.000.

Ochsner, Rolf H., to Robertshaw Controls Company. Method of making a plurality of substantially identical flexible diaphragms. 4,028,461, Cl. 264-297.000.

O'Connell, Gerard Peter. Art of brewing individual servings of coffee in a cup. 4,027,582, Cl. 99-306.000.

Oda, Yasuhiro: *See—*
Futami, Takashi; Tatsukemi, Yoshiharu; Takamoto, Toyoji; Oda, Yasuhiro; and Tomoda, Masayasu, 4,028,431.

O'Doenell, Harry B., III: *See—*
Johnson, James J.; and Loeber, David Y., 4,027,457.

Offer, Robert J.; and Van Vooren, Bernard J., to Tenneco Inc. Relief valve for a fluid filter assembly. 4,028,243, Cl. 210-130.000.

Offermanns, Heribert: *See—*
Azinger, Friedrich; Offermanns, Heribert; and Gluzek, Karl-Heinz, 4,028,406.

Ogawa, Shinasku; Ide, Akira; Komatsu, Kazurou; Matsumoto, Sojiro; and Kishimoto, Yasushi, to Asahi Kasei Kogyo Kabushiki Kaisha. Isocyanate prepolymers. 4,028,392, Cl. 260-453.0AR.

Ogawa, Taizo: *See—*
Tsuchiya, Hiroshi; Mukai, Kunio; Kimura, Akio; Taya, Hiroshi; Fujimoto, Keimei; Ozaki, Toshiaki; Yamamoto, Sigeo; Ogawa, Taizo; Ooishi, Tadashi; and Okuno, Yositosi, 4,028,438.

Ogino, Katsuhiko: *See—*
Kamatani, Yoshio; Okazaki, Hisayoshi; Imai, Ko; Fujita, Noriaki; Yamazaki, Yoshio; and Ogino, Katsuhiko, 4,028,185.

Ogiso, Mitsutoshi: *See—*
Shigeta, Yoshihiro; Suzaki, Kuniyoshi; and Ogiso, Mitsutoshi, 4,027,958.

Ohara, Kazuo: *See—*
Murakami, Noboru; Hirosawa, Koichiro; Ohara, Kazuo; and Matsuo, Koichi, 4,027,551.
Murakami, Noboru; Hirosawa, Koichiro; Ohara, Kazuo; and Matsuo, Koichi, 4,027,552.

O'Hara, Mark J.; and Gleim, William K. T., to UOP Inc. Method of catalyst manufacture. 4,028,273, Cl. 252-432.000.

Ohashi, Saichiro; and Fujita, Susumu, to Fuji Photo Film Co., Ltd. Data recording camera. 4,028,713, Cl. 354-106.000.

Ohio State University, The: *See—*
Young, Jonathen D.; and Celdecott, Ross, 4,028,707.

Ohishi, Tadashi, to Kyodo Denshi Kogyo Co., Ltd. Needle detector for circular knitting machines. 4,027,982, Cl. 356-237.000.

Ohuchi, Yasushi: *See—*
Tatsumi, Hideo; and Ohuchi, Yasushi, 4,028,568.

Okada, Akira; Iriyama, Keiji; and Shiraki, Masaru, to Director-General of the Agency of Industrial Science and Technology. Method for the separation of chlorophyll. 4,028,217, Cl. 260-314.000.

Okamoto, Atutoshi: *See—*
Arai, Hiroshi; Nakamura, Akira; Sugiura, Akio; Okamoto, Atutoshi; and Toyama, Koichi, 4,027,926.

Okazaki, Hisayoshi: *See—*
Kamatani, Yoshio; Okazaki, Hisayoshi; Imai, Ko; Fujita, Noriaki; Yamazaki, Yoshio; and Ogino, Katsuhiko, 4,028,185.

Okumura, Osamu; Saketani, Takenobu; Yamane, Izumi; and Kashiwada, Toshinobu, to Lion Fat & Oil Co., Ltd. Method of manufacturing granular detergents. 4,028,282, Cl. 252-537.000.

Okuno, Yositosi: *See—*
Tsuchiya, Hiroshi; Mukai, Kunio; Kimura, Akio; Taya, Hiroshi; Fujimoto, Keimei; Ozaki, Toshiaki; Yamamoto, Sigeo; Ogawa, Taizo; Ooishi, Tadashi; and Okuno, Yositosi, 4,028,438.

Okuyama, Toru: *See—*
Sato, Shigetake; Kurahashi, Suminobu; Okuyama, Toru; and Hamada, Noboru, 4,028,287.

Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., to Hewlett-Packard Company. Programmable calculator employing algebraic language. 4,028,538, Cl. 235-156.000.

Olich, Jack: *See—*
Snyder, Lloyd R.; Oberhardt, Bruce J.; and Olich, Jack, 4,028,056.

Olin Corporation: *See—*
Capuano, Italo A., 4,028,197.
Ford, James M., 4,028,213.
Ford, James M.; and Mecken, Elmer N., 4,028,214.
Kircher, Morton S., 4,028,210.
Olin, John Merrill; and Urs, Venkataramaraj Subbaraj, 4,027,594.

Olin, John Merrill; and Urs, Venkataramaraj Subbaraj, to Olin Corporation. Disintegrating lead shot. 4,027,594, Cl. 102-92.400.

Olschewski, Armin: *See—*
Kunkel, Heinrich; Brandenstein, Manfred; Olschewski, Armin; Finzel, Sigismund; Gossmann, Willi; and Horling, Peter, 4,027,932.

Olsen, Robert A. Method and apparatus for testing spot welds. 4,027,529, Cl. 73-88.00B.

Olson, Gregory J., to Packaging Corporation of America. Shipping container. 4,027,794, Cl. 206-395.000.

Olson, Robert A., to P. H. Glatfelter Co. Methods of making combined titanium dioxide and calcium carbonate and opaque paper containing the resulting combination. 4,028,173, Cl. 162-181.00A.

Olster Asphalt Fabriek B.V.: *See—*
van den Berg, Antoon J., 4,028,293.

Olstowski, Franciszek, to Dow Chemical Company, The. Solid, rapid-setting, rigid polyurethanes. 4,028,296, Cl. 260-30.40N.

Olstowski, Franciszek, to Dow Chemical Company, The. Solid, rapid-setting, rigid polyurethanes. 4,028,299, Cl. 260-30.40N.

Olstowski, Franciszek, to Dow Chemical Company, The. Solid, rapid-setting, rigid polyurethanes. 4,028,301, Cl. 260-31.40R.

Olstowski, Franciszek, to Dow Chemical Company, The. Solid, rapid-setting, rigid polyurethanes. 4,028,303, Cl. 260-33.20R.

Olstowski, Franciszek, to Dow Chemical Company, The. Solid, rapid-setting, rigid polyurethanes. 4,028,304, Cl. 260-33.8UB.

Olympia Werke AG: *See—*
Weber, Gerald; and Sorgenfrei, Jurgen, 4,028,682.

Parker, Gerald R.: *See—*
Collins, Robert Henry; Levine, Richard F.; North, William D.; O'Rourke, Gerald D.; and Parker, Gerald R., 4,028,150.

Parker, Kenneth Wade, to N-S-W Corporation. Power wrenches with two point reaction means. 4,027,560, Cl. 81-57.390.

Parker, Richard W.; and Kaeser, Arthur L., to Parker Sweeper Company. Spreader for fertilizer, seed and the like. 4,027,788, Cl. 222-614.000.

Parker Sweeper Company: *See—*
Parker, Richard W.; and Kaeser, Arthur L., 4,027,788.

Parks, James R. Cargo restraining assembly for use in a vehicle. 4,027,892, Cl. 280-179.00R.

Parks, Jill J.; and Snook, Stephen R. Quasi-corner reflectors for electromagnetic radiation. 4,028,701, Cl. 343-18.00C.

Parma Industries, Inc.: *See—*
Fields, Gerald S., 4,028,076.

Partridge, John Joseph, Jr.; and Uskokovic, Milan Radoje, to Hoffmann-La Roche Inc. Syntheses of 24R,25- and 24S,25-dihydroxycholesterol 24,25-ketals and alkanoyl derivatives thereof. 4,028,349, Cl. 260-239.55D.

Patel, Ashok Z.: *See—*
Cavegnero, Erman V.; and Patel, Ashok Z., 4,028,007.

Patel, Vishnubhai V.: *See—*
Engler, Edward M.; and Patel, Vishnubhai V., 4,028,346.

Paterson Candy International Limited: *See—*
Audsley, Alan Keith, 4,028,018.

Patrick, Stanley R. Herbicide applicator. 4,027,986, Cl. 401-138.000.

Petteri, Matti, to Exel OY. Juncture arrangement between the bow of a hearing protection means and a protective helmet. 4,027,341, Cl. 2-423.000.

Patterson, Garvin W.: *See—*
Monahan, Earnest M.; and Patterson, Garvin W., 4,028,664.

Patton, Tad L., to Exxon Research and Engineering Company. Process for the hydrolysis of poly(iminoimidazolidinediones) to polyparabanic acids. 4,028,311, Cl. 260-77.50R.

Patznick, Richard Arthur; and Border, Gary Clayton, to Johns-Manville Corporation. Method and apparatus for controlling temperature within a furnace. 4,028,083, Cl. 65-29.000.

Paul, Thomas Campbell: *See—*
Lampl, Friedrich; and Paul, Thomas Campbell, 4,027,793.

Paulstra: *See—*
Hauraus, Pierre; and Domer, Michel, 4,027,909.

Pavolka, John D.: *See—*
Adler, Franklin P.; and Pavolka, John D., 4,027,921.

Pearson, Laurence B., to Pearson's, Inc. Livestock squeeze chute. 4,027,629, Cl. 119-99.000.

Pearson's, Inc.: *See—*
Pearson, Laurence B., 4,027,629.

Peckham, David G., to Trane Company, The. Method and apparatus for absorption refrigeration system. 4,028,078, Cl. 62-101.000.

Peelman, Harold E.; and Laegford, Obie M., to Texaco Inc. Behind well casing water flow detection system. 4,028,546, Cl. 250-266.000.

Peiffer, Howard Richard: *See—*
Kahn, David; and Peiffer, Howard Richard, 4,028,591.

Peil, Archie W.: *See—*
Slator, Damon T.; Bishop, Thomas R.; and Peil, Archie W., 4,027,816.

Peinado, Rabadan: *See—*
Jarque, Ricardo Granados; Cartes, Juan Bosch; Cabiro, Jorge Cansis; Roldan, Cristobal Martinez; and Peinado, Rabadan, 4,028,371.

Pelosi, Stanford Salvatore, Jr.; and Alaimo, Robert James, to Morton-Norwich Products, Inc. Antibacterial thiocyanatobenzothiazoles. 4,028,374, Cl. 260-305.000.

Pendergrass, John E.: *See—*
Swallow, Roger T.; and Pendergrass, John E., 4,027,667.

Pennwalt Corporation: *See—*
Lange, Harold Carl; and MacLeay, Ronald Edward, 4,028,344.

Pepperhoff, Werner; and Richter, Friedhelm, to Maonesmann Aktiengesellschaft. Cryogenic steel. 4,028,098, Cl. 75-126.00B.

Perkins, Charles H., to Robertshaw Controls Company. Reversing valve construction. 4,027,700, Cl. 137-625.660.

Perkins, Lee E., to Kajan Specialty Company, Inc. Tool for washing perforations in cased well bore. 4,027,732, Cl. 166-312.000.

Perkins, Manuel Garfield: *See—*
Johnston, Donald Leroy; Perkins, Manuel Garfield; and Youngberg, Lynn Zaugg, 4,027,669.

Permalock Company, Inc.: *See—*

Precision Flexmold, Inc.: *See—*
Maurino, William J.; and Putzer, Raymond M., 4,027,723.
Putzer, Raymond M., 4,027,845.

Preradovich, Radovan. Shaft liner assembly. 4,027,488, Cl. 61-41.00R.

Pretto, John. Angle of attack indicating device. 4,027,533, Cl. 73-188.000.

Prevedello, Aldo; and Platone, Edoardo, to Snam Progetti, S.p.A. Method for the preparation of octene-nitrile organic compounds and compounds obtained thereby. 4,028,395, Cl. 260-465.400.

Pries, Thomas H.: *See—*
Taylor, Fredrick J.; Smith, Jack; and Pries, Thomas H., 4,028,673.

Priewasser, Georg: *See—*
Ellbrunner, Adalbert; Priewasser, Georg; Georg, Friedrich; and Stock, Horst, 4,028,137.

Prince Manufacturing, Inc.: *See—*
Sweeton, Gerard F., 4,027,646.

Prinz, Richerd; Elghani, Salah Elabd; Fischer, Winfried; and Alberts, Heinrich, to Bayer Aktiengesellschaft. Thermoplastic moulding compounds. 4,028,433, Cl. 260-873.000.

Prull, Phillip Earl. Method for extracting oil from oil shale. 4,028,222, Cl. 208-11.00R.

Pullens, Gedell. Portable battery operated hot-cold storage unit. 4,027,727, Cl. 165-48.000.

Pullman Incorporated: *See—*
Adler, Franklin P.; and Pavolka, John D., 4,027,921.
Deller, Robert J.; and Carmel, Edwin L., 4,027,743.

Puron, Jean Paul: *See—*
Cachier, Gerard; and Puron, Jean Paul, 4,028,556.

Puskes, Imre; and Cengel, John A., to Standard Oil Company (Indiana). Polybutene composition containing halo-carbonyl additives and use thereof. 4,028,264, Cl. 252-182.000.

Putter, Rolf: *See—*
Rottloff, Gunther; Sundermann, Rudolf; Grigat, Ernst; and Putter, Rolf, 4,028,393.

Putzer, Raymond M., to Precision Flexmold, Inc. Flexible mold including rigid encapsulated mandrel. 4,027,845, Cl. 249-142.000.

Putzer, Raymond M.: *See—*
Maurino, William J.; and Putzer, Raymond M., 4,027,723.

Quaif, Richard S., to NCR Corporation. Matris print head impact energy control. 4,027,761, Cl. 197-1.00R.

Quaker Oats Company, The: *See—*
Hohner, Gary Arlyn; and Hyldon, Roy Godfrey, 4,028,468.

Quehen, Andre, to SECIM. Device for restoration of the mechanical characteristics of the metal band in a casting wheel for continuous casting of liquid metal. 4,027,725, Cl. 164-278.000.

Quentin, Karl-Ernst; Weil, Ludwig; and Berger, Harald, to Hoechst Aktiengesellschaft. Water purification process. 4,028,233, Cl. 210-28.000.

Quinlivan, Richard Paul, to General Electric Company. High angle of attack aircraft control system utilizing a pseudo acceleration signal for control purposes. 4,027,839, Cl. 244-195.000.

R. T. Vanderbilt Company, Inc.: *See—*
Karsten, Kenneth S.; and Karabinos, Joseph V., 4,028,394.

Rackard, Troy D., to National Gypsum Company. Single hung window with removable fixed lite. 4,027,431, Cl. 49-458.000.

Radke, Edmund John; and Bair, Joseph Louis, to Borg-Warner Corporation. Compact vibration damper. 4,027,757, Cl. 192-106.200.

Raffel, Jack I.: *See—*
Herndon, Terry O.; and Raffel, Jack I., 4,027,383.

Rahman, Habibur; and Joslyn, Gerald L., to Massey-Ferguson Inc. Single lever control. 4,027,547, Cl. 74-471.0XY.

Rahrig, Donald D.; and Revells, Robert G., to Libbey-Owens-Ford Company. Apparatus for bending and tempering glass sheets by differential cooling. 4,028,086, Cl. 65-273.000.

Ramella, Arnaldo: *See—*
Ramella, Ferdinando; Ramella, Pier Vincenzo; and Ramella, Arnaldo, 4,027,408.

Ramella, Ferdinando; Ramella, Pier Vincenzo; and Ramella, Arnaldo. Digger teeth with interlocking tooth elements. 4,027,408, Cl. 37-141.00T.

Ramella, Pier Vincenzo: *See—*
Ramella, Ferdinando; Ramella, Pier Vincenzo; and Ramella, Arnaldo, 4,027,408.

Rand, Maurice: *See—*
Goodfellow, Anthony Gerald; and Rand, Maurice, 4,028,042.

Rao, Tadikonda Narashimha; and Toumani, Rouben, to Bell Telephone Laboratories, Incorporated. Transceivers for single channel carrier telephone systems. 4,028,628, Cl. 325-400.000.

Rapistan, Incorporated: *See—*
Staes, Daniel, 4,028,528.

Rattiner, David H.: *See—*
Albanese, Angelo P.; and Rattiner, David H., 4,028,697.

Rauchle, Roy J.; and Vandenberg, John L., to Brunswick Corporation. Engine transmission and speed control with warm-up interlock apparatus. 4,027,555, Cl. 74-878.000.

Rausing, Ruben; Nedstedt, Gert; Holmstrom, Hakan; Palm, Lars-Erik; and Stefan, Stjepan, to Tetra Pak Developpement SA. Packing containers with ripping thread opening and packing material webs for the manufacture of the packing containers. 4,027,455, Cl. 53-14.000.

Ravin, Boris Iosifovich: *See—*
Pitelyaev, Grigory Vasilievich; Telpukhovsky, Evdokim Semenovich; Ravin, Boris Iosifovich; and Gladkov, Alexei Grigorievich, 4,027,441.

Ringland, Robert S., to Tandy Corporation. Band pass amplifier. 4,028,629, Cl. 330-2.000.

Ripoche, Andre: *See—*
Sureau, Claude; Tournaire, Michel; Zorn, Jean-Rene; Sturbois, Gilbert; Chavinie, Jacques; Le Houezec, Roger; and Ripoche, Andre, 4,027,657.

Ritchie, James A., to Caterpillar Tractor Co. Oil seal for a rotary engine. 4,028,020, Cl. 418-51.000.

Ritsko, Joseph E.: *See—*
Laferty, John M., Jr.; Ritsko, Joseph E.; and Port, David J., 4,028,095.

Rittenhouse, Dennis Edwin, to Northern Electric Company Limited. Method and apparatus for translating multiple frequency signalling. 4,028,501, Cl. 179-84.0VF.

Robbins, Roland W., Jr. Solar-energy-powered sun tracker. 4,027,651, Cl. 126-270.000.

Roberge, Emile. Fuel tank cap. 4,028,075, Cl. 55-387.000.

Robert Bosch G.m.b.H.: *See—*
Moder, Helmut, 4,027,641.
Nieskens, Antonius; Slenders, Petrus; and Palmkoeck, Christian, 4,027,459.
Streit, Klaus; Kugelmann, Adolf; and Seiler, Hartmut, 4,028,564.

Robert Hain Associates, Inc.: *See—*
Hadtke, Frederick B., 4,027,340.

Robert, Louis: *See—*
Naudy, Rene; Phoyu, Francois; Robert, Louis; Legousse, Maurice; Audouard, Jean-Marie; and Le Roux, Herve, 4,028,049.

Robertshaw Controls Company: *See—*
Newell, Dennis E., 4,028,593.
Ochsner, Rolf H., 4,028,461.
Perkins, Charles H., 4,027,700.
Willson, James R.; and Tyler, Hugh J., 4,028,736.
Wolfe, Denis G., 4,027,689.

Robertson, George Heddle, to Ciba-Geigy Corporation. Pigment dispersions. 4,028,128, Cl. 106-308.00Q.

Robie, Susan P.: *See—*
Millard, Ben; and Robie, Susan P., 4,028,281.

Robin, Michael; and Schulte, Sheldon R., to Ashland Oil, Inc. Hindered phenol amines. 4,028,416, Cl. 260-570.50P.

Robitschek, Emmerich: *See—*
Greenwood, John H.; and Robitschek, Emmerich, 4,027,865.

Rochlitz, Jurgen; and Zunker, Reinhard, to Hoechst Aktiengesellschaft. Diamine condensation products in double layer photoconductive recording elements. 4,028,102, Cl. 96-1.500.

Rockaway Corporation: *See—*
Varga, Leroy M.; and Fitch, Robert B., 4,027,578.

Rocket Research Corporation: *See—*
Schmidt, Eckart W., 4,027,476.

Rockwell International Corporation: *See—*
Hagon, Peter J.; and Heworth, John, 4,028,639.

Roffelsen, Franciscus, to N.V. Spiro Research. Device for venting and aerating closed circulatory water flow systems. 4,027,691, Cl. 137-202.000.

Rogers, Jimmy Dale; and Creecy, Michael Earl, to United States of America, Nevy. Drive control to prevent simultaneous conduction in push-pull switching amplifier. 4,028,633, Cl. 330-118.000.

Rogers, Kenneth A. Golf iron manufacture. 4,027,885, Cl. 273-169.000.

Rohm and Haas Company: *See—*
McNulty, Patrick J.; and Warner, Harlow L., 4,028,084.

Rohr Industries, Inc.: *See—*
Garry, Frederick W., 4,027,737.

Rohrer, Jurgen: *See—*
Strunz, Alfred; and Rohrer, Jurgen, 4,028,047.

Roldan, Cristobal Martinez: *See—*
Jarque, Ricardo Granados; Cartes, Juan Bosch; Cabiro, Jorge Canals; Roldan, Cristobal Martinez; and Peinado, Rabadan, 4,028,371.

Rollei-Werke Franke & Heidecke: *See—*
Stiller, Armin; and Borejko, Stefan, 4,028,613.

Rolls-Royce (1971) Limited: *See—*
Carlisle, Denis Richard, 4,028,044.

Romanin, Bruno, to Cempagnie des Brevets et Applications Industrielles Etablissement. Method and device for dummy shuttle operation on conventional shuttle looms. 4,027,704, Cl. 139-438.000.

Romer, Ludwig: *See—*
Keller, Herbert; Krieg, Bruno; and Romer, Ludwig, 4,027,996.

Rondeau, Henry S. Spray bonding of nickel aluminum and nickel titanium alloys. 4,027,367, Cl. 428-652.000.

Roper Corporation: *See—*
De Weese, Raymond Paul; and Kumpfer, Beverly D., 4,028,519.
Torrey, Sumner H., 4,028,520.
Uyeda, Frederick K.; and Austin, Buddy J., 4,028,521.

Rosback, Donald H.: *See—*
Neuzil, Richard W.; and Rosback, Donald H., 4,028,428.

Roseberg, Harry G. Clothing banger. 4,027,812, Cl. 223-96.000.

Rosen, George; Carlick, Daniel J.; and Reiter, Ralph H., to Sun Chemical Corporation. Photopolymerizable compounds and compositions comprising the product of the reaction of a resin and a polycarboxy-substituted benzophenone. 4,028,204, Cl. 204-159.140.

Rosenbaum, Walter Steven, to International Business Machines Corporation. Digital reference hyphenation matrix apparatus for automatically forming hyphenated words. 4,028,677, Cl. 340-172.500.

Rosenberg, John D. Franchise board game. 4,027,882, Cl. 273-134.0AT.

Rosenblum, Jesse. Vibratory separator screen and method of menufecture. 4,028,230, Cl. 209-403.000.

Rosenfeld, Jerome E. Dry transfer product and process. 4,028,165, Cl. 156-234.000.

Rosenkilde, Hakon. Electromagnetic sound generator. 4,028,503, Cl. 179-115.00R.

Rosinski, Klaus D.; and Schroer, John W., to Owens-Corning Fiberglas Corporation. Method for analysis of treated glass fibers. 4,028,472, Cl. 427-8.000.

Ross, John W.: *See—*
Cassidy, Stephen; Baboian, Robert; Frechette, Reymond A.; Haynes, Gardner S.; and Ross, John W., 4,028,064.

Rossmy, Gerd: *See—*
Fink, Hana-Ferdi; Fritsch, Herwig; Koerner, Gotz; Rossmy, Gerd; and Schmidt, Gunter, 4,028,218.

Rozzler, John J., to Brooks & Perkins, Incorporated. Production of neutron shielding material. 4,027,377, Cl. 29-420.500.

Rothgordt, Ulf: *See—*
Jost, Gerhard; Rothgordt, Ulf; and Witter, Klaus, 4,028,711.

Roto-Master, Inc.: *See—*
MacInnes, Hugh, 4,027,994.

Rottleb, Dieter, to Gutermann & Co. Aktiengesellschaft. Spool for thread. 4,027,831, Cl. 242-125.100.

Rottloff, Gunther; Sundermann, Rudolf; Grigat, Ernst; and Putter, Rolf, to Bayer Aktiengesellschaft. Process for the production of polyfunctional cyanic acid esters. 4,028,393, Cl. 260-453.00P.

Roussel-UCLAF: *See—*
Hainaut, Daniel; and Demoute, Jean-Pierre, 4,028,386.

Roussopoulos, Paul: *See—*
Boudouris, Georges; Kalopissis, Gregoire; Leveque, Jean-Luc; and Roussopoulos, Paul, 4,028,518.

Rouvre, Philippe; and Augello, Daniel Jean, to Regie Nationale des Usines Renault; and Automobiles Peugeot. Central circuit control plates for automotive vehicles. 4,028,738, Cl. 361-403.000.

Royer, Robert Dale; and Schwab, Thomas Frank, to Bell Telephone Laboratories, Incorporated. Digital computer arrangement for high speed memory access. 4,028,663, Cl. 340-172.500.

Rubin, Gerald, to Exxon Research and Engineering Company. Elimination of pinking in vinyl asbestos formulations. 4,028,328, Cl. 260-42.440.

Rubino, Andrew M.; Jones, John L.; and Bretschneider, Edward S., to Armour Pharmaceutical Company. Methods of making basic zirconium complexes. 4,028,390, Cl. 260-429.300.

Rucker, Dugan Allan: *See—*
Krum, Jack Kern; Wollermann, Louis Albert; and Rucker, Dugan Allan, 4,028,471.

Rufenacht, Kurt: *See—*
Meyer, Willy; Bohner, Beat; Dawes, Dag; and Rufenacht, Kurt, 4,028,377.

Ruggiero, Arthur. Multi-face clamp for manufacturing or regluing of drawers, chairs or the like. 4,027,866, Cl. 269-41.000.

Ruiz, Gilbert G. Patient restraint for X-ray studies of infants. 4,027,869, Cl. 269-328.000.

Runfeldt, Nils Harald: *See—*
Wenoberg, Olov Carl Gustav; and Runfeldt, Nils Harald, 4,027,378.

Russell, Homer C.: *See—*
Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., 4,028,538.

Russell, John Xavier, to Babcock & Wilcox Company, The. Pot broaching machine. 4,027,574, Cl. 90-10.000.

Rutherford, Harry Wayne. Tank bottom assembly apparatus. 4,027,374, Cl. 29-256.000.

Ruthroff, Clyde Leslie: *See—*
Bodtmann, William Fred; and Ruthroff, Clyde Leslie, 4,028,641.

Ruumpol, Geurt J., to Veco Beheer Electroforming/Photo Etching B.V. System for passing products to be treated through a machine. 4,028,605, Cl. 318-696.000.

Ryckman, William D., Jr., to General Electric Company. Apparatus for heating dispensable flowable material. 4,027,786, Cl. 222-146.0HA.

Ryobi, Ltd.: *See—*
Tasaka, Tomoyuki; and Honkawa, Yoshinori, 4,027,588.

S.A.F. Societe Agricole et Fonciere S.A.: *See—*
Imhof, Hugo, 4,028,030.

S & C Electric Company: *See—*
Schmunk, E. William; and Tobin, Thomas J., 4,028,656.

Saam, Charles W., to Harter Corporation. Method of making a chair leg base. 4,027,364, Cl. 29-150.000.

Saburi, Akio, to Nippon Electric Company, Ltd. Acquisition technique for time division multiple access communication system. 4,028,497, Cl. 179-15.0BS.

Sachs, Elmer B. Airplane. 4,027,835, Cl. 244-101.000.

Sado, Yukio: *See—*
Yamamoto, Yukio; and Sado, Yukio, 4,027,581.

Safar, Petr; Langr, Josef; Kolar, Miloslav; and Nosek, Stanislav, to Vyzkumny Ustav Bavlnarsky. Strand-braking apparatus. 4,027,705, Cl. 139-450.000.

Sahmkow, Dieter: *See—*
Hickmann, Karl; and Sahmkow, Dieter, 4,028,445.

Sai, Fumio: *See—*
Murata, Moriyasu; Sai, Fumio; and Fujino, Takashi, 4,028,280.
Murata, Moriyasu; Sai, Fumio; and Fujino, Takashi, 4,028,283.

Saich, William George, to Solartron Electronic Group Limited, The. Data terminals having interactive keyboards and displays and data processing apparatus incorporating such terminals. 4,028,695, Cl. 340-365.00R.

St. Clair, Theodore A., to Testron, Inc. Methods and apparatus for proof testing gas meters. 4,027,523, Cl. 73-3.000.

Saint-Gobain Industries: *See—*
Pons, Andre, 4,028,131.

Saint-Lot, Armand, to Thomson-CSF. Electronic switching arrangement for a homing and traffic radio system. 4,028,624, Cl. 325-23.000.

Saito, Kazuaki: *See—*
Doi, Tsuneyuki; Komoto, Hiroshi; Chono, Masazumi; Inoue, Akira; Saito, Kazuaki; and Shinozuka, Isao, 4,028,055.

Saito, Minoru: *See—*
Hirai, Masahide; Fujimura, Mikio; Kazigase, Masahiro; and Saito, Minoru, 4,028,284.

Saito, Yuichi, to Nissan Motor Co., Ltd. Pressure reducer device. 4,027,923, Cl. 303-6.00C.

Sakaguchi, Hiroshi: *See—*
Ueda, Shoji; Ono, Shuzi; Sakaguchi, Hiroshi; and Tsunoda, Hideo, 4,028,455.

Sakai, Shuzo, to Kabushiki Kaisha Hayashibara Seibutsu Kagaku Kenkyujo. Process for the production of saccharified starch products. 4,028,186, Cl. 195-31.00R.

Sakai, Toshiyuki; Matsuo, Koichi; and Tochio, Yukihiro, to Mitsui Mining & Smelting Co., Ltd. Process for preparing catalytic materials for purifying exhaust gas and catalytic materials prepared thereby. 4,028,275, Cl. 252-466.0PT.

Sakamoto, Minoru. Locking jalousie frame. 4,027,430, Cl. 49-403.000.

Sakamoto, Takashi: *See—*
Ono, Yoshio; and Sakamoto, Takashi, 4,028,105.

Sakano, Takeshi: *See—*
Kawasaki, Kaoru; Sakano, Takeshi; Furuya, Shigeru; and Endo, Shigeru, 4,027,803.

Sakasegawa, Koji: *See—*
Yamamoto, Tomio; Sakasegawa, Koji; Osumi, Atsushi; Hosaka, Yukio; and Yamada, Takeo, 4,027,978.

Sakatani, Takenobu: *See—*
Okumura, Osamu; Sakatani, Takenobu; Yamane, Izumi; and Kashiwada, Toshinobu, 4,028,282.

Sakurada, Nobuaki: *See—*
Kawamura, Masaharu; Sakurada, Nobuaki; Shinoda, Nobuhiko; Ito, Tadashi; Ito, Fumio; and Murakami, Hiroyashu, 4,028,712.

Salter, Lucien; and Maincent, Gabriel. Apparatus and method for display of images. 4,028,732, Cl. 358-289.000.

Salto, Rinaldo, to Ing. C. Olivetti & C., S.p.A. Keyboard for office machines. 4,027,763, Cl. 197-16.000.

Salvatore, Michael. Method of lasting shoe uppers to a last and lasted shoe uppers and articles of footwear produced thereby. 4,027,406, Cl. 36-83.000.

Samis, Philip Lawrence. Positive identification method and structure. 4,027,391, Cl. 32-1.000.

Samuels, W. Edward. Gas-energized liquid transfer and control system. 4,027,791, Cl. 222-396.000.

Sanders Associates, Inc.: *See—*
Misek, Victor A., 4,027,970.
Mortimer, Thomas J., 4,028,661.
Stevens, Robert R., 4,028,699.

Sanderson, William A., to Burlington Industries, Inc. Process for preparing m-aminobenzenephosphonic acid. 4,028,403, Cl. 260-502.500.

Sando Iron Works Co., Ltd.: *See—*
Sando, Yoshikazu; and Ishidoshiro, Hiroshi, 4,027,507.

Sando, Yoshikazu; and Ishidoshiro, Hiroshi, to Sando Iron Works Co., Ltd. Air-and-liquid combined sealing device for high pressure steamer. 4,027,507, Cl. 68-5.00E.

Sandoval, Jorge: *See—*
Domic, Esteban; Sfeir, Albert; and Sandoval, Jorge, 4,028,462.

Sapp, Lawrence G.; Slappey, James F.; and Nison, C. Bart. Unitizing frame for a pallet. 4,027,599, Cl. 108-55.100.

Sargentini, Enrico; and Carena, Ugo, to Ing. C. Olivetti & C., S.p.A. Inking device for the type-carrier element of a calculating machine. 4,027,766, Cl. 197-151.000.

Sato, Akira; Ikeda, Tadashi; Sueyoshi, Tohru; Nakamura, Yasuharu; and Shimada, Takeo, to Fuji Photo Film Co., Ltd. Photographic sensitive materials having a dyed layer. 4,028,112, Cl. 96-84.00R.

Sato, Akira: *See—*
Hinata, Masanao; Takei, Haruo; Sato, Akira; Iwamoto, Atsuo; and Hayashi, Jun, 4,028,115.

Sato, Haruto. Swimming glove. 4,027,347, Cl. 9-308.000.

Sato, Hisatake: *See—*
Tsuchiya, Shozo; Sato, Hisatake; Oshima, Akio; and Hayashi, Hideo, 4,028,291.

Sato, Shigetake; Kurahashi, Suminobu; Okuyama, Toru; and Hamada, Noboru, to Bridgestone Tire Company Limited. Process for continuous preparation of a foam polyamide. 4,028,287, Cl. 260-2.50N.

Sato, Tadashi: *See—*
Hamaguchi, Sachihiko; Oomura, Ikuo; Sato, Tadashi; and Wada, Hisashi, 4,028,687.

Satzinger, Gerhard; and Hechtfischer, Gustav, to Warner-Lambert Company. Process for substituted cyclohexenes and its products. 4,028,398, Cl. 260-471.00A.

Sauerbrunn, Robert Dewey: *See—*
Livingston, Richard Donnan; and Sauerbrunn, Robert Dewey, 4,028,443.

Savarimuthu, Sundar. Reinforcing hole punch device. 4,028,170, Cl. 156-513.000.

Sawa, Toshio: *See—*
Nishimura, Shigeoki; Sawa, Toshio; Otani, Kouji; and Kikkawa, Seiichi, 4,028,237.

Sawada, Shuzo: *See—*
Fujisawa, Michio; Matsumoto, Hatsuo; Sawada, Shuzo; Yamane, Kiyoshi; Kato, Hideo; Shimizu, Takayuki; and Kato, Shigeo, 4,027,345.

Sawada, Yuji: *See—*
Kawarai, Takashi; Sawada, Yuji; Takemoto, Katsumi; and Mikami, Sadao, 4,027,823.

Sawyer, Philip Nicholas; and Stanczewski, Boguslaw, to Interface Biomedical Laboratories Corporation. Endosteal bionic tooth and implantation method. 4,027,392, Cl. 32-10.00A.

Saxon, Robert: *See—*
Li, Tsi Tieh; and Saxon, Robert, 4,028,305.

Sayigh, Adnan A. R.; Sun, Kwok K.; and Ulrich, Henri, to Upjohn Company, The. Process for the purification of MDA. 4,028,361, Cl. 260-570.00D.

SCA Development Aktiebolag: *See—*
Bohlin, Karl Gunnar; Eriksson, Karl Rune; and Gustafsson, Carl-Erik, 4,027,736.

Schaaf, Robert, to Air Filters, Inc. Vacuum cleaner filter bag. 4,028,074, Cl. 55-366.000.

Schachte, John J.: *See—*
Zankl, Frank; Kirkham, Edward E.; Stobbe, Richard E.; and Schachte, John J., 4,028,599.

Schaefer, Carl W. D.; Schaefer, Richard L.; and Kennedy, Gordon F., to Frank W. Schaefer Inc. Metal melting furnace with alternate heating systems. 4,027,862, Cl. 266-160.000.

Schaefer, Hermann Reinhold: *See—*
Flowers, Theodore Robert; and Schaefer, Hermann Reinhold, 4,027,348.

Schaefer, Richard L.: *See—*
Schaefer, Carl W. D.; Schaefer, Richard L.; and Kennedy, Gordon F., 4,027,862.

Schafer, Inge: *See—*
Bite, Pal; Moravcsik, Imre; Schafer, Inge; Horvath, Gyula; Meherfalvi nee Vajna, Zsuzsanna; Borvendeg, Janos; and Hermann nee Szente, Ilona, 4,028,348.

Schafer, Walter; Wagner, Kuno; and Muller, Hans-Jurgen, to Bayer Aktiengesellschaft. Process for the production of polyureas. 4,028,310, Cl. 260-77.5CH.

Schaidle, William J.; and Stewart, Patrick H., to Core-Lube, Inc. Binding resin for foundry sand and catalyst therefor. 4,028,271, Cl. 252-429.00R.

Schall, William L.: *See—*
Kahn, Henry; and Schall, William L., 4,028,329.

Schaller, Karl: *See—*
Failla, Henri; Schaller, Karl; and Vidard, Michel, 4,028,177.

Schaub, Robert Eugene; and Weiss, Martin Joseph, to American Cyanamid Company. 16,16-Spirocycloalkyl prostaglandin derivatives. 4,028,396, Cl. 260-468.00D.

Schei, Asle: *See—*
Fahlen, Nils; and Schei, Asle, 4,028,592.

Scheibel, Edward G., to Suntech, Inc. Cascade refrigeration system. 4,028,079, Cl. 62-335.000.

Schenker, Barry A.: *See—*
Lewis, David L.; Franks, C. Richard; and Schenker, Barry A., 4,028,215.

Schering Aktiengesellschaft: *See—*
Wenzel, Martin; and Langheim, Detlef, 4,028,389.

Schiel, Christian, to J. M. Voith GmbH. Cylinder machine having positive pressure chambers adjacent an outer band. 4,028,175, Cl. 162-274.000.

Schlatter, James M.: *See—*
Jones, David A., Jr.; Schlatter, James M.; Mikulec, Richard A.; Reuter, Judith A.; and Mazur, Robert H., 4,028,319.

Schlegel Corporation: *See—*
Lind, Earl V., 4,028,456.

Schlicker, Heinrich August, to AB Volvo Penta. Hydraulic servo-brake arrangement for double circuit brakes. 4,027,922, Cl. 303-6.00R.

Schloss, Alden. Record-reproduce device for flash cards. 4,027,405, Cl. 35-35.00C.

Schlotman, Walter F., to Stanadyne, Inc. Faucet valve and seal therefor. 4,027,851, Cl. 251-172.000.

Schmelzer Corporation: *See—*
Benjamin, Benjamin C., 4,027,634.

Schmider, Paul, to Beckman Instruments G.m.b.H. Apparatus for doping semiconductors in centrifuge. 4,027,622, Cl. 118-49.500.

Schmidt, Eckart W., to Rocket Research Corporation. Composite catalyst bed and method for making the same. 4,027,476, Cl. 60-218.000.

Schmidt, Gunter: *See—*
Fink, Hans-Ferdi; Fritsch, Herwig; Koerner, Gotz; Rossmy, Gerd; and Schmidt, Gunter, 4,028,218.

Schmidt, Warren E.: *See—*
Finney, Robert H.; and Schmidt, Warren E., 4,028,002.

Schmunk, E. William; and Tobin, Thomas J., to S & C Electric Company. High voltage fuse with outer heat-shrinkable sleeve. 4,028,656, Cl. 337-186.000.

Schmutz, Hermann: *See—*
Huschka, Hans; Schmutz, Hermann; and Vygen, Peter, 4,028,181.

Schnatmeyer, Hans; and Schutzer, Gerhard, to Gustav F. Gerdts KG. Check valve. 4,027,695, Cl. 137-527.000.

Schneider, Abraham, to Suntech, Inc. Explosive composition containing alkyl ethers having high densities. 4,028,153, Cl. 149-46.000.

Schneider, Abraham: *See—*
Borkowski, Walter L.; and Schneider, Abraham, 4,028,152.

Schneider, Richard: *See—*
Rendell, Stanley E.; and Schneider, Richard, 4,027,570.

Schnell, William J.: *See—*
Miller, Jimmy L.; and Schnell, William J., 4,028,253.

School Health Supply Company: *See—*
Good, Carleton R., 4,027,954.

Schopp, Hans, to Ellenberger & Poensgen GmbH. Calorimetric flow monitor. 4,028,689, Cl. 340-239.00R.

Schossow, George W. Electrically grounded vaporizer structure. 4,028,526, Cl. 219-295.000.

Schossow, George W. Safety circuit for electrical equipment. 4,028,594, Cl. 307-326.000.

Schott, John P.: *See—*
Piech, Kenneth R.; and Schott, John R., 4,027,980.

Schroeder, Lloyd A. Model aircraft propulsion. 4,027,422, Cl. 46-78.000.

Schroeder, William Edward: *See—*
Gewartowski, James Walter; and Schroeder, William Edward, 4,028,637.

Schroer, John W.: *See—*
Rosinski, Klaus D.; and Schroer, John W., 4,028,472.

Schubert, Anthony E.: *See—*
McKee, William H.; and Schubert, Anthony E., 4,027,521.

Schulman, Joseph H.; and Moore, Robert F., to Pacesetter Systems, Inc. Myocardial lead. 4,027,677, Cl. 128-418.000.

Schulte, Sheldon R.: *See—*
Robin, Michael; and Schulte, Sheldon R., 4,028,416.

Schultz, James J.; and Van Pelt, Vincent J., to Tennessee Valley Authority. Fertilizer processes incorporating scrubbed flue gas sludge byproduct. 4,028,087, Cl. 71-25.000.

Schuplin, Jerome T., to Fastway Fasteners, Inc. Hold down clip for ceiling tile in grid-type ceiling. 4,027,454, Cl. 52-714.000.

Schuster, Stanley E.: *See—*
Cook, Peter William; and Schuster, Stanley E., 4,028,694.

Schutzer, Gerhard: *See—*
Schnatmeyer, Hans; and Schutzer, Gerhard, 4,027,695.

Schwab, Thomas Frank: *See—*
Royer, Robert Dale; and Schwab, Thomas Frank, 4,028,663.

Schwan, Thomas J., to Morton-Norwich Products, Inc. 2-Diethoxyethyl(dimethyl)(2-(2,4-diphenyl-5-pyrimidyl)-2-oxoethyl)ammonium bromide. 4,028,359, Cl. 260-256.40R.

Schwartz, Rene, to Groupe Europeen pour la Technique des Turbines a Vapeur G.E.T.T. S.A. Fixing arrangement for a guide part of a fixed casing on a rotating machine. 4,027,998, Cl. 415-219.00R.

Schwarz, Alois: *See—*
Weiland, Emil; Schwarz, Alois; and Frommlet, Hubert, 4,028,000.

Schwarz, Hans-Helmut; and Immel, Otto, to Bayer Aktiengesellschaft. Method for processing lactam residues which contain boric acid. 4,028,347, Cl. 260-239.30A.

Schwarzmann, Frederick G.: *See—*
Petersen, Arthur W.; Cimiluca, Arthur; and Hirschberger, Leonard, 4,028,261.

Schweizerische Aluminium AG: *See—*
Theobald, Reiner; and Heubner, Ulrich, 4,027,716.

Schwibach, Wilhelm: *See—*
Eichinger, Johann; and Schwibach, Wilhelm, 4,027,553.

Scott, Marion L., to United States of America, Navy. IR imaging with surface wave readout. 4,028,548, Cl. 250-330.000.

Scott, Norman H., to UOP Inc. Fractionation column with vapor channeling baffles. 4,028,191, Cl. 202-158.000.

Scott Paper Company: *See—*
Millard, Ben; and Robie, Susan P., 4,028,281.

Scrivens, George W., to Johnson & Johnson. Cardiovascular drape. 4,027,665, Cl. 128-132.00D.

SECIM: *See—*
Quehen, Andre, 4,027,725.

Seibel, Julia K. Drag reducing fairing for landing gear. 4,027,836, Cl. 244-103.00R.

Seibu Polymer Kasei Kabushiki Kaisha: *See—*
Tanikawa, Takayoshi, 4,027,902.

Seide, Adolf, to Werner & Pfleiderer. Screw extruder and calender assemblage. 4,028,031, Cl. 425-147.000.

Seidl, Joachim: *See—*
Seidl, Maximilian R.; Seidl, Joachim; and Henry, Walton M., 4,027,590.

Seidl, Maximilian R.; Seidl, Joachim; and Henry, Walton M., to Avery International Corporation. Label, ticket and tag printing machine with interchangeable tape supply and feeder magazines. 4,027,590, Cl. 101-288.000.

Seiler, Claus-Dieter: *See—*
Vahlensieck, Hans-Joachim; Seiler, Claus-Dieter; and Kotzsch, Hans-Joachim, 4,028,384.

Seiler, Hartmut: *See—*
Streit, Klaus; Kugelmann, Adolf; and Seiler, Hartmut, 4,028,564.

Seki, Kenji; Kimura, Akio; Asahi, Satoshi; and Takeshita, Yasuhiro, to Idemitsu, Kosan Kabushiki-Kaisha (Idemitsu Kosan Co., Ltd.). Process for producing block copolymers. 4,028,435, Cl. 260-878.00B.

Selam, Gabriel. Device for detecting and positioning a mobile object capable of moving in at least one given path. 4,028,603, Cl. 318-587.000.

Sels, Francis Jeanne: *See—*
Berendsen, Jules Robert; Pollet, Robert Joseph; Philippaerts, Herman Adelbert; Sels, Francis Jeanne; and Willems, Jozef Frans, 4,028,110.

Sensoli, Robert A.: *See—*
Cole, Gerald S.; Kovacs, Bela V.; Sensoli, Robert A.; and Smartt, Herschel B., 4,028,099.

Sera, Hidefumi; Nagao, Kameji; and Ishii, Tsumoru, to Fujii Photo Film Co., Ltd. Method of hardening gelatin using sulfonyl compounds. 4,028,320, Cl. 260-117.000.

Sezaki, Tamotsu: *See—*
Ikeda, Tsunemi; and Sezaki, Tamotsu, 4,027,617.

Sfeir, Albert: *See—*
Domic, Estehan; Sfeir, Albert; and Sandoval, Jorge, 4,028,462.

Shaduya, Vladimir Leontievich: *See—*
Chachin, Viktor Nikolaevich; Zdor, Gennady Nikolaevich; Zhuravsky, Alexandr Julyanovich; Golovkina, Elena Yakovlevna; and Shaduya, Vladimir Leontievich, 4,027,515.

Shakespeare Company: *See—*
Derrick, Danny O., 4,027,741.

Shand, Kenneth James. Apparatus and method for increasing speed of horses. 4,027,462, Cl. 54-71.000.

Sharp, Benny H., to Western Electric Company, Inc. Method of and video system for identifying different light-reflective surface areas on articles. 4,028,728, Cl. 358-106.000.

Sharp, Donald E.: *See—*
Yanko, William H.; and Sharp, Donald E., 4,028,410.

Shaw, Victor Henry, to Plessey Handel und Investments A.G. Illuminated optical viewers. 4,027,957, Cl. 353-21.000.

Sheehan, John Timothy: *See—*
Bodanszky, Miklos; and Sheehan, John Timothy, 4,028,315.

Shell Oil Company: *See—*
Goppel, Johan M.; and Chant, Peter R., 4,028,477.
van den Brink, Marinus J.; Austermuhle-Bertola, Helena; and Kramer, Petrus A., 4,028,418.

Shelton, Claude M.: *See—*
Bogen, Richard T.; and Shelton, Claude M., 4,028,436.

Shelton, Herbert P. Solar energy operated air compressor. 4,028,008, Cl. 417-52.000.

Shelton, Jack: *See—*
Leesure, William; Garcia, Luis; Reifel, Charles; and Shelton, Jack, 4,027,579.

Shemonaev, Alexandr Tikhonovich; Cherny, Dmitry Grigorievich; Genis, Semen Naumovich; and Vishnitsky, Igor Konstantinovich. Transverse frame of industrial building carcass. 4,027,438, Cl. 52-27.000.

Sherrill, Frank C., to Ellison Company, Inc., The. Loom reed. 4,027,702, Cl. 139-192.000.

Shibata, Norio: *See—*
Goto, Kenji; Shibata, Norio; and Hashiguchi, Yukihide, 4,027,635.

Shigeta, Yoshihiro; Suzaki, Kuniyoshi; and Ogiso, Mitsutoshi, to Canon Kabushiki Kaisha. System for controlling reproduction of audio tape in synchronism with projection of video film. 4,027,958, Cl. 353-26.00A.

Shiina, Naonori: *See—*
Hashimoto, Makoto; Uehara, Shinzi; Sugita, Tadashi; and Shiina, Naonori, 4,028,448.

Shikano, Yoshiro; and Ueoka, Yasuhiro, to Mitsubishi Denki Kabushiki Kaisha. Cooling device for heat generation member. 4,028,723, Cl. 357-82.000.

Shikeno, Yoshiro: *See—*
Kobayashi, Osi; Shikano, Yoshiro; and Yano, Masao, 4,027,728.

Shikasho, Satoru: *See—*
Hayes, William Roger; and Shikasho, Satoru, 4,027,821.

Shima, Masao: *See—*
Togo, Masaaki; Shima, Masao; and Mochizuki, Kiyoshi, 4,028,604.

Shimada, Takeo: *See—*
Sato, Akira; Ikeda, Tadashi; Sueyoshi, Tohru; Nakamura, Yasuharu; and Shimada, Takeo, 4,028,112.

Shimade, Toshio: *See—*
Hujimori, Masao; Nakajima, Shigeo; Takahashi, Ken; Ito, Tsunetoshi; Shimada, Toshio; and Endo, Hajime, 4,027,918.

Shimano Industrial Company, Limited: *See—*
Kine, Masayoshi, 4,027,746.
Nagano, Masashi, 4,027,542.

Shimizu, Takeyuki: *See—*
Fujisawa, Michio; Matsumoto, Hatsuo; Sawada, Shuzo; Yamane, Kiyoshi; Kato, Hideo; Shimizu, Takayuki; and Kato, Shigeo, 4,027,345.

Shimizu, Yoshiyuki: *See—*
Mori, Ikuo; and Shimizu, Yoshiyuki, 4,027,951.

Shimogawa, Toshiaki; Morita, Masayuki; and Kawaharazaki, Takashi, to Nippon Soken, Inc. Seat belt system for vehicle. 4,027,905, Cl. 280-746.000.

Shinoda, Nobuhiko: *See—*
Kawamura, Masaharu; Sakurada, Nobuaki; Shinoda, Nobuhiko; Ito, Tadashi; Ito, Fumio; and Murakami, Hiroyashu, 4,028,712.

Shimozuka, Isao: *See—*
Doi, Tsunesuke; Komoto, Hiroshi; Chono, Masazumi; Inoue, Akira; Saito, Kazuaki; and Shinozuka, Isao, 4,028,055.

Shiomura, Tetsunosuke; Ito, Akiro; Morimoto, Yoshio; and Iwao, Tetsuya, to Mitsui Toatsu Chemicals, Incorporated. Production of olefin polymers and novel catalysts therefore. 4,028,481, Cl. 526-142.000.

Shionogi & Co., Ltd.: *See—*
Yukinaga, Hisajiro; Sumimoto, Shinzaburo; Ishizuka, Ichiro; and Sugita, Jitsuo, 4,028,376.

Shiraki, Masaru: *See—*
Okada, Akira; Iriyama, Keiji; and Shiraki, Masaru, 4,028,217.

Shorrock Developments Limited: *See—*
Buckley, Norman Ian; and Wilson, Edward, 4,028,690.

Shortes, Samuel R.; and Millis, Edwin Graham, to Texas Instruments Incorporated. Method and apparatus for cleaning the surface of a semiconductor slice with a liquid spray of de-ionized water. 4,027,686, Cl. 134-33.000.

Showa Denko Kabushiki Kaisha: *See—*
Ueshima, Takashi; Tanaka, Yasuzi; and Kobayashi, Shoichi, 4,028,482.

Shufflebarger, Earl D.; Kish, Edward E.; Boylan, John R.; Diehl, George D.; Gallagher, Bernard J.; and Tobbe, William P., to Nupro Company. Fluid filter. 4,028,254, Cl. 210-447.000.

Shufflebarger, Earl D.: *See—*
Murauskas, Donald J.; Kish, Edward E., Jr.; Cunningham, Frank M.; Gallagher, Bernard J.; and Shufflebarger, Earl D., 4,028,248.

Shutoh, Masamichi, to Nippon Electric Company, Ltd. Driving circuit for selecting control cells of a gas discharge panel by transistors through diodes. 4,028,584, Cl. 315-169.0TV.

Sickel, Helmut, deceased (by Sickel, Liesbet, administrator), to Dr. Kuhn & Co. GmbH. Speech aid apparatus for laryngectomees. 4,028,492, Cl. 179-1.0AL.

Sickel, Liesbet, administrator: *See—*
Sickel, Helmut, deceased, 4,028,492.

Siegmund, Walter P.: *See—*
Krohn, David A.; Grolman, Bernard; and Siegmund, Walter P., 4,028,082.

Siemens Aktiengesellschaft: *See—*
Blaschke, Felix; and Klautschek, Herwig, 4,028,600.
Kraupa, Werner, 4,028,176.

Siemens-Albis Aktiengesellschaft: *See—*
Wolfer, Gerhard, 4,028,676.

Siempelkamp Giesserei KG: *See—*
Beckmann, Georg, 4,027,690.

Silverman, Herman, to KDI Sylvan Pools, Inc. Method of constructing swimming pools. 4,027,442, Cl. 52-309.400.

Simmons, James Almy: *See—*
Bell, Robert Joseph; and Simmons, James Almy, 4,028,464.

Simms, William D.: *See—*
De Ment, Robert B.; and Simms, William D., 4,027,513.

Simon, Helmut: *See—*
Niemeyer, Willy; and Simon, Helmut, 4,027,871.

Singer Company, The: *See—*
Kerr, Alexander Fraser, 4,027,609.
Kwast, Theodore Emil; and Smith, Gordon Marlon, 4,027,373.
Marsh, David Raymond; and Osofsky, Raymond C., 4,027,403.
Mishcon, Lester; and Christopolous, John, 4,027,505.
Moll, Dean H.; and Greiner, Alan, 4,028,524.

Singh, Ritindar: *See—*
Andersson, Leif; and Singh, Ritindar, 4,027,699.

SKF Industrial Trading and Development Company B.V.: *See—*
Kunkel, Heinrich; Brandenstein, Manfred; Olschewski, Armin; Finzel, Sigismund; Gossmann, Willi; and Horling, Peter, 4,027,932.

SKF Nova AB: *See—*
Lundgren, Bengt G. S., 4,027,718.

Skowronski, Michael J.: *See—*
Hipchen, Donald E.; Skowronski, Michael J.; and Hagan, Joseph R., 4,028,158.

Skrydstrup, Ole, to Central Dynamics Ltd. Mix/effects switch arrangement and mix/effects switching system. 4,028,727, Cl. 358-181.000.

Slappey, James F.: *See—*
Sapp, Lawrence G.; Slappey, James F.; and Nixon, C. Bart, 4,027,599.

Slator, Damon T.; Bishop, Thomas R.; and Peil, Archie W., to Bowen Tools, Inc. Seal assembly. 4,027,816, Cl. 277-188.00R.

Slenders, Petrus: *See—*
Nieskens, Antonius; Slenders, Petrus; and Palmkoeck, Christian, 4,027,459.

Slingluff, Eugene L., to Krandes Corporation. Radiographic opaque and conductive stripped medical tubes. 4,027,659, Cl. 128-2.00M.

Sloss, Barry L.: *See—*
Stayner, Vance A.; and Sloss, Barry L., 4,028,134.

Sly, Howard M. Water actuated garbage compactor. 4,027,584, Cl. 100-218.000.

Smartt, Herschel B.: *See—*
Cole, Gerald S.; Kovacs, Bela V.; Sensoli, Robert A.; and Smartt, Herschel B., 4,028,099.

Smit Ovens Nijmegen B.V.: *See—*
Verhoeven, Gerardus H. Th. M.; and Stensen, Heinrich P., 4,028,052.

Smith, Bradley W.: *See—*
Kamath, G. Sanjiv; and Smith, Bradley W., 4,028,147.

Smith, Clay D.; and Keller, D. V., Jr., to Otisca Industries, Ltd. Methods of and apparatus for hydrocarbon recovery. 4,027,731, Cl. 166-267.000.

Smith, Earl T.: *See—*
Campagnuolo, Carl J.; Smith, Earl T.; and Dale, Ronald L., 4,027,593.

Smith, Edward Dyal: *See—*
Weiss, James Paul; and Smith, Edward Dyal, 4,028,550.

Smith, Gordon Marlon: *See—*
Kwast, Theodore Emil; and Smith, Gordon Marlon, 4,027,373.

Smith, Harry A.: *See—*
Ball, Clifford L.; and Smith, Harry A., 4,028,312.

Smith, Jack: *See—*
Taylor, Fredrick J.; Smith, Jack; and Pries, Thomas H., 4,028,673.

Smith, Joseph F. Uniroll false twist device and method. 4,027,467, Cl. 57-77.400.

Smith Kline & French Laboratories Limited: *See—*
White, George Raymond, 4,028,379.

Smith, Lawrence: *See—*
United States of America, National Aeronautics and Space Administration; Smoot, George F.; Pope, William L.; and Smith, Lawrence, 4,027,494.

Smith, Peter William: *See—*
Gloge, Detlef Christoph; Smith, Peter William; and Chinnock, Edwin LeRoy, 4,027,814.

Smith, Randlow; Jones, Henry B.; Jobsis, Adrianus C.; and Deloney, Hugh C., to Texaco Inc. Methods and multiple thermocouple support assembly. 4,028,139, Cl. 136-230.000.

SmithKline Corporation: *See—*
Blackburn, Dale W., 4,028,355.
Levinson, Sidney Harry; and Mendelson, Wilford Lee, 4,028,408.

Smoot, George F.: *See—*
United States of America, National Aeronautics and Space Administration; Smoot, George F.; Pope, William L.; and Smith, Lawrence, 4,027,494.

Snam Progetti, S.p.A.: *See—*
Prevedello, Aldo; and Platone, Edoardo, 4,028,395.

Snell, George J.: *See—*
Sze, Morgan C.; and Snell, George J., 4,028,221.

Snook, Stephen R.: *See—*
Parks, Jill J.; and Snook, Stephen R., 4,028,701.

Snow, John E., to Champion International Corporation. Product processing system with price printer. 4,028,537, Cl. 235-61.90R.

Snyder, Lloyd R.; Oberhardt, Bruce J.; and Olich, Jack, to Technicon Instruments Corporation. Substance separation technique. 4,028,056, Cl. 23-230.00B.

Snyder, Robert P.; and Deja, Edmund P., to Trippensee Corporation. Latch releasing mechanism for water samplers. 4,027,538, Cl. 73-425.40R.

Sobel, Jay E.: *See—*
Carlson, David H. J.; Verachtert, Thomas A.; and Sobel, Jay E., 4,028,269.

Krenzer, John, 4,028,375.
Lindvay, Michael W., 4,028,333.

Veneklasen, Mark S. Musical horn construction. 4,027,571, Cl. 84-380.00R.

Venot, Robert: *See—*
Jullien, Rene; Perona, Maurice; and Venot, Robert, 4,028,178.

Verachtert, Thomas A.: *See—*
Carlson, David H. J.; Verachtert, Thomas A.; and Sobel, Jay E., 4,028,269.

Verbeij, Oswald Johannes, to U.S. Philips Corporation. Circuit arrangement in a television receiver, provided with a line deflection circuit and a switched supply voltage circuit. 4,028,589, Cl. 315-408.000.

Verdier, Henri, to Compagnie Generale des Etablissements Michelin, raison sociale Michelin & Cie. Tire filled with lubricant coated cellular particles. 4,027,712, Cl. 152-311.000.

Vereinigte Edelstahlwerke AG: *See—*
Plockinger, Erwin; Daghofer, Otto; and Barakat, Farouk, 4,027,720.

Verhoeven, Gerardus H. Th. M.; and Stensen, Heinrich P., to Smit Ovens Nijmegen B.V. Tunnel furnace for the heat treatment of articles. 4,028,052, Cl. 432-145.000.

Vidard, Michel: *See—*
Failla, Henri; Schaller, Karl; and Vidard, Michel, 4,028,177.

Vig, John R.; and LeBus, John W., to United States of America, Army. Method of cleaning surfaces by irradiation with ultraviolet light. 4,028,135, Cl. 134-1.000.

Vig, John R.: *See—*
Di Vita, Sam; and Vig, John R., 4,028,080.

Vinyl-Cbem International, Inc.: *See—*
Golumbic, Harvey J., 4,028,160.

Viohl, Uwe, to International Standard Electric Corporation. Photochemical system for coating the luminescent screen of a color television picture tube. 4,028,114, Cl. 96-93.000.

Vishnitsky, Igor Konstantinovich: *See—*
Shemonaev, Alexandr Tikhonovich; Cherny, Dmitry Grigorievich; Genis, Semen Naumovich; and Vishnitsky, Igor Konstantinovich, 4,027,438.

Vitatron Medical B.V.: *See—*
van Oostveen, Arie A.; and Wittkampf, Fred H. M., 4,027,678.

Vittorelli, Vittore, to Ing. C. Olivetti & C., S.p.A. System for automatically processing and printing the contents and the format of a text. 4,028,680, Cl. 340-172.500.

Vittorelli, Vittore, to Ing. C. Olivetti & C., S.p.A. System for automatically processing and printing the contents and the format of a text. 4,028,681, Cl. 340-172.500.

Vlahakis, Peter J. Apparatus for alignment of plaid fabric on a cutting table. 4,027,395, Cl. 33-80.000.

Voegeli, Otto: *See—*
Eggenberger, John Scott; and Voegeli, Otto, 4,028,685.

Volesky, Bohumil: *See—*
Zajic, James E.; and Volesky, Bohumil, 4,028,182.

Volk, Joseph A., Jr., to Beta Corporation. Image counter. 4,028,552, Cl. 250-570.000.

Volkmann, Adolf. Skateboard with brake. 4,027,890, Cl. 280-11.200.

Volkswagenwerk Aktiengesellschaft: *See—*
Klebba, Horst, 4,027,432.

Voplex Corporation: *See—*
vanManen, Dick T., 4,027,810.

Wada, Hisayuki: *See—*
Enomoto, Satoru; Takita, Hitoshi; Wada, Hisayuki; Mukaida, Yntaka; and Yanaka, Mikiro, 4,028,387.

Wada, Masahiro; and Date, Masakazu, to Toyo Boseki Kabushiki Kaisha. Polyester fiber treated with anionic polyalkylene oxide emulsified polyester polyether finish. 4,027,346, Cl. 8-30.000.

Wagner, Kuno; and Hajek, Manfred, to Bayer Aktiengesellschaft. Urea or carbonamide containing diisocyanate polyaddition products with phosphoric ester substituents. 4,028,306, Cl. 260-75.0NT.

Wagner, Kuno: *See—*
Muller, Peter; Wagner, Kuno; and Muller, Richard, 4,028,313.
Schafer, Walter; Wagner, Kuno; and Muller, Hans-Jurgen, 4,028,310.

Wagner, Richard C.; and Banike, Ronald A., to Hollymatic Corporation. Meat tenderizer. 4,027,356, Cl. 17-25.000.

Wagner, Walter. Scouring pad with retained contoured stiffener. 4,027,352, Cl. 15-209.00C.

Wagner, William. Air injection engine. 4,027,632, Cl. 123-75.0RC.

Wahl, Edward F., III, to Occidental Petroleum Corporation. Device for converting internal energy of hot fluids to shaft work. 4,027,483, Cl. 60-641.000.

Wahl, Richard: *See—*
Byrnes, Herbert P.; and Wahl, Richard, 4,027,935.

Wahlborg, Harold J.: *See—*
Bond, William C., Jr.; and Wahlborg, Harold J., 4,028,483.

Wake, Shigeo; and Futagami, Mikio, to Sumitomo Chemical Company, Limited. Coating composition. 4,028,300, Cl. 260-31.20R.

Wakino, Kikuo; Nishikawa, Toshio; Tamura, Sadahiro; and Ishikawa, Youhei, to Murata Manufacturing Co., Ltd. Dielectric resonator and microwave filter using the same. 4,028,652, Cl. 333-73.00W.

Walcon Corporation: *See—*
Daly, Edwin A., 4,027,436.

Walden, Jack M.: *See—*
Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., 4,028,538.

Walker, Brooks. Wheeled suitcase. 4,027,754, Cl. 190-18.00A.

Walker, Francis H.: *See—*
Baker, Don R.; Walker, Francis H.; and Letchworth, Peter E., 4,028,411.

Walker, John Hirst; Sutton, James Anthony; and Waters, John Henry, to Dowty Mining Equipment Limited. Mine roof support. 4,027,489, Cl. 61-45.00D.

Wallace, Paul W.: *See—*
Tambini, Angelo L.; and Wallace, Paul W., 4,027,530.

Wallace, Ray H., to Transworld Adhesive & Chemical Corporation. Method for making hot melt adhesive sticks and other shapes. 4,028,458, Cl. 264-148.000.

Wallding, Wayne A.; and Arrandale, Roy S., to Dart Industries Inc. Pre-labelled coated container. 4,027,426, Cl. 40-310.000.

Wallis, James William, to Wallis Separators Limited. Separator method and apparatus. 4,028,232, Cl. 210-19.000.

Wallis, Marvin E. Modular engine assembly. 4,027,484, Cl. 60-709.000.

Wallis, Marvin E. Modular engine assembly. 4,027,485, Cl. 60-709.000.

Wallis Separators Limited: *See—*
Wallis, James William, 4,028,232.

Wallrafen, Gunter, to Maschinen- und Bohrgerate-Fabrik Alfred Wirth & Co., K.G. Device for actuating screw-threaded bolts. 4,027,559, Cl. 81-57.380.

Walton, Edward B.: *See—*
Feenan, Patrick J.; and Walton, Edward B., 4,027,643.

Waltrip, Owen R., to Nuclear Supreme. Material mixing and compacting apparatus. 4,028,040, Cl. 425-449.000.

Ward, Dennis J.: *See—*
Volk, Joseph A., Jr.; and Ward, Dennis J., 4,028,430.

Ward, Donald H.; and Buffenbarger, John K., to Armco Steel Corporation. Seam forming apparatus. 4,027,611, Cl. 113-54.00R.

Wardlaw, Stephen Clark; Levine, Robert Aaron; and Massey, James Vincent, III. Material layer volume determination. 4,027,660, Cl. 128-2.00F.

Warner, Harlow L.: *See—*
McNulty, Patrick J.; and Warner, Harlow L., 4,028,084.

Warner-Lambert Company: *See—*
Brown, Richard E.; and Unangst, Paul C., 4,028,383.
Satzinger, Gerhard; and Hechtfischer, Gustav, 4,028,398.

Warwicker, Eric Albert, to Porvair Limited. Method of making water vapor permeable polymer sheet material. 4,028,451, Cl. 264-45.800.

Washburn, Ryan F.: *See—*
Miller, Eldon D.; and Washburn, Ryan F., 4,028,453.

Watanabe, Atsumi, to Hitachi, Ltd. Inverter control system. 4,028,607, Cl. 321-5.000.

Watanabe, Eiki, to Mitsubishi Denki Kabushiki Kaisha. Elevator speed control system. 4,027,745, Cl. 187-29.00R.

Watanabe, Katsumi, to Yugen Kaisha Watanabe Kenkyusho. Toy phonograph with automatic pickup arm return means. 4,027,887, Cl. 274-1.00A.

Waters Associates, Incorporated: *See—*
Abrahams, Louis, 4,027,983.

Waters, John Henry: *See—*
Walker, John Hirst; Sutton, James Anthony; and Waters, John Henry, 4,027,489.

Watkins, Laurence Shrapnell: *See—*
Frazee, Ralph Edward, Jr.; and Watkins, Laurence Shrapnell, 4,027,977.

Watson, Kenoeth, to Westland Aircraft Limited. Rotor for rotary wing aircraft. 4,028,001, Cl. 416-134.00A.

Watson, Robert E.: *See—*
Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., 4,028,538.

Wavin B.V.: *See—*
de Putter, Warner Jan, 4,028,039.

Weavell, Jack, to CAE Machinery Ltd. Controlled transversely movable guide means for lumber. 4,027,563, Cl. 83-106.000.

Webb, Jimmy L., to General Electric Company. Novel flame retsrdant polycarbonate compositions. 4,028,297, Cl. 260-37.0PC.

Webb, Samuel Lee: *See—*
Desio, Frank B.; and Webb, Samuel Lee, 4,028,515.

Weber, Gerald; and Sorgenfrei, Jurgen, to Olympia Werke AG. Circuit arrangement for selecting the function of connection contacts on circuit chips. 4,028,682, Cl. 340-172.500.

Weber, Harold J., to Coulter Information Systems, Inc. Corona power supply circuit. 4,028,596, Cl. 361-235.000.

Webster, William C.; Hilton, Robert G.; and Cotts, Ronald F., to IU Conversion Systems, Inc. Disposal method and use of sewage sludge. 4,028,130, Cl. 106-120.000.

Weidner, Herbert: *See—*
Beinert, Klaus; and Weidner, Herbert, 4,028,058.

Weigl, John W.: *See—*
Fantuzzo, Joseph; Ferguson, Robert M.; and Weigl, John W., 4,027,964.

Weihmuller, Walter N., to Supreme Farmstead Equipment, Inc. Reciprocating belt feeder for elongated bins. 4,027,806, Cl. 214-16.00R.

Weil, Ludwig: *See—*
Quentin, Karl-Ernst; Weil, Ludwig; and Berger, Harald, 4,028,233.

Weil, Tomas: *See—*
Muller, Werner Heinrich; and Weil, Tomas, 4,028,417.

Weiland, Emil; Schwarz, Alois; and Frommlet, Hubert, to Messerschmitt-Bolkow-Blohm GmbH. Blade connection for helicopter rotor blades. 4,028,000, Cl. 416-107.000.

Weinberger, Arnold: *See—*
Arps, Ronald Barthold; Bahl, Lalit Rai; and Weinberger, Arnold, 4,028,731.

Weinhold, Karl. Valve with generally spherical closure member. 4,027,698, Cl. 137-625.220.

Weiss, James Paul; and Smith, Edward Dyal, to Du Pont de Nemours, E. I., and Company. X-ray screens. 4,028,550, Cl. 250-483.000.

Weiss, Martin Joseph: *See—*
Schaub, Robert Eugene; and Weiss, Martin Joseph, 4,028,396.

Wells, Joel D.: *See—*
McClure, George F.; Endicott, John Richard; Freeman, Lionel D.; Cunningham, Marion L.; and Wells, Joel D., 4,028,500.

Wennberg, Olov Carl Gustav; and Runfeldt, Nils Harald. Removing deposited material from the edge portions of a plate. 4,027,378, Cl. 29-427.000.

Wennerstrom, Jerald Meeker, to Babcock & Wilcox Company, The. Distributor. 4,027,920, Cl. 302-28.000.

Wenninger, Fred, Jr.: *See—*
Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., 4,028,538.

Wenzel, Martin; and Langheim, Detlef, to Schering Aktiengesellschaft. Metallocenes and metallocene derivatives having a radioactive central atom. 4,028,389, Cl. 260-429.0CY.

Werner & Pfleiderer: *See—*
Seide, Adolf, 4,028,031.
Worz, Wolfgang, 4,028,027.

Wesley-Jessen Inc.: *See—*
Loshaek, Samuel, 4,028,295.

Western Electric Company,: *See—*

Yamamoto, Tadahiro; and Yoneda, Kenji, to Nissan Motor Co., Ltd. Flow rate control apparatus in exhaust gas recirculation system. 4,027,636, Cl. 123-119.00A.
Yamamoto, Takenori; Tsukisaka, Tsuneo; and Tsukahara, Takeshi, to Honda Giken Kogyo Kabushiki Kaisha. Fitting device for windshield. 4,027,914, Cl. 296-78.100.
Yamamoto, Tomio; Sakasegawa, Koji; Osumi, Atsushi; Hosaka, Yukio; and Yamada, Takeo, to Nippon Kokan Kabushiki Kaisha; and Fuji Toyuki Kabushiki Kaisha. Method and apparatus for non-contact measurement of a gauge of a high temperature material. 4,027,978, Cl. 356-156.000.
Yamamoto, Yoshiro: *See—*
Yoshida, Yoshinori; and Yamamoto, Yoshiro, 4,028,424.
Yamamoto, Yukio; and Sado, Yukio, to Yoshida Kogyo Kabushiki Kaisha. Ventilator. 4,027,581, Cl. 98-98.000.
Yamane, Izumi: *See—*
Okumura, Osamu; Sakatani, Takenobu; Yamane, Izumi; and Kashiwada, Toshinobu, 4,028,282.
Yamane, Kiyoshi: *See—*
Fujisawa, Michio; Matsumoto, Hatsuo; Sawada, Shuzo; Yamane, Kiyoshi; Kato, Hideo; Shimizu, Takayuki; and Kato, Shigeo, 4,027,345.
Yamane, Mikiya: *See—*
Kamo, Tomoichi; and Yamane, Mikiya, 4,028,617.
Yamano, Tetuyuki: *See—*
Takeuchi, Hiroshi; Ishizawa, Toshitugu; Yamano, Tetuyuki; Chiba, Ko; and Kobayashi, Daisaku, 4,028,022.
Yamatake-Honeywell Company Limited: *See—*
Togo, Masaaki; Shima, Masao; and Mochizuki, Kiyoshi, 4,028,604.
Yamaura, Yoshitomo; Kobayashi, Takayoshi; Asanuma, Akira; and Miyazawa, Kuichiro, to Kabushiki Kaisha Shinko Seisakusho. Safety device actuatable by seismic vibrations. 4,028,510, Cl. 200-61.45R.
Yamazaki, Yoshiaki: *See—*
Kuroda, Michio; Namura, Kiyoshi; Kato, Fumio; Yamazaki, Yoshiaki; Iwasaki, Tutomu; Ishida, Akira; Sohma, Akio; and Imai, Tetsu, 4,028,006.
Yamazaki, Yoshio: *See—*
Kamatani, Yoshio; Okazaki, Hisayoshi; Imai, Ko; Fujita, Noriaki; Yamazaki, Yoshio; and Ogino, Katsuhiko, 4,028,185.
Yanagisawa, Yuzuru: *See—*
Komatsu, Yasutoshi; and Yanagisawa, Yuzuru, 4,028,649.
Yanaka, Mikiro: *See—*
Enomoto, Satoru; Takita, Hitoshi; Wada, Hisayuki; Mukaida, Yutaka; and Yanaka, Mikiro, 4,028,387.
Yang, Charles C.: *See—*
Becker, Mitchell; and Yang, Charles C., 4,028,195.
Yanko, William H.; and Sharp, Donald E., to United States of America, Health, Education and Welfare. Process of preparing 1,3-bis(2-chloroethyl)-1-nitrosourea. 4,028,410, Cl. 260-553.00R.
Yano, Masao: *See—*
Kobayashi, Gai; Shikano, Yoshiro; and Yano, Masao, 4,027,728.
Yarger, Francis C.: *See—*
Todd, Jackson D.; and Yarger, Francis C., 4,027,681.

Yasuo, Hashino: *See—*
Tsutomu, Abe; Yasuo, Hashino; and Hidebiko, Kobayashi, 4,028,187.
Yatsuo, Tsutomu; and Akabane, Katsumi, to Hitachi, Ltd. Semiconductor controlled rectifier device. 4,028,721, Cl. 357-38.000.
Yazawa, Norihiko: *See—*
Konishi, Yoshihiro; Konno, Kenichi; Yazawa, Norihiko; and Hoshino, Norio, 4,028,650.
Yeda Research & Development Co. Ltd.: *See—*
Fischler, Henryk; Krupka, Yaakov; and Itzchak, Jacov, 4,027,663.
Yee, Bing S.: *See—*
Frank, Earl E.; and Yee, Bing S., 4,027,595.
Yee, Henry Kai-Hen, to Northern Telecom Limited. Monolithic crystal filters. 4,028,647, Cl. 333-72.000.
Yee, Yen Sung: *See—*
Heller, Lawrence Griffith; Terman, Lewis Madison; and Yee, Yen Sung, 4,028,558.
Yessaian, Harry A. Vibratory coolant strainer for machine tool coolant systems. 4,028,247, Cl. 210-153.000.
Yockey, Francis J.: *See—*
Olander, Emil Edward, Jr.; James, Rex L.; Larson, Ivar W.; Covington, Wayne F.; Walden, Jack M.; Watson, Robert E.; Yockey, Francis J.; Wenninger, Fred, Jr.; and Russell, Homer C., 4,028,538.
Yokotsuka, Tamotsu: *See—*
Hayashi, Kazuya; Mizunuma, Takeji; and Yokotsuka, Tamotsu, 4,028,470.
Ishiyama, Jiro; Kato, Motohiko; Yoshida, Fumihiko; and Yokotsuka, Tamotsu, 4,028,184.
Yoneda, Kenji: *See—*
Yamamoto, Tadahiro; and Yoneda, Kenji, 4,027,636.
Yoneya, Kiyoo, to Yoshida Kogyo Kabushiki Kaisha. Sliding clasp fastener. 4,027,361, Cl. 24-205.00R.
Yoshida, Fumihiko: *See—*
Ishiyama, Jiro; Kato, Motohiko; Yoshida, Fumihiko; and Yokotsuka, Tamotsu, 4,028,184.
Yoshida Kogyo Kabushiki Kaisha: *See—*
Kando, Akiyoshi; and Kindai, Ryoichi, 4,027,369.
Yamamoto, Yukio; and Sado, Yukio, 4,027,581.
Yoneya, Kiyoo, 4,027,361.
Yoshida, Yoshinori; and Yamamoto, Yoshiro, to Japan Synthetic Rubber Co., Ltd. Process for preparing unsaturated alcohols. 4,028,424, Cl. 260-638.00R.
Yoshimine, Masao: *See—*
Kroposki, Lorraine M.; Yoshimine, Masao; and Freedman, Harold H., 4,028,439.
Yoshioka, Yoshioki: *See—*
Yamada, Koichi; Morimoto, Teijiro; and Yoshioka, Yoshioki, 4,028,119.
Young, Chung-Chang, to Owens-Illinois, Inc. pH Responsive glass compositions and electrodes. 4,028,196, Cl. 204-1.00T.
Young, Donald C.; and Backlund, P. Stanley, to Union Oil Company of California. Soil amendment and method. 4,028,088, Cl. 71-28.000.
Young, George Ralph, Jr.: *See—*
Lund, Norman S.; Young, George Ralph, Jr.; and Lund, Norman W., 4,028,246.
Young, Jonathan D.; and Caldecott, Ross, to Ohio State University, The. Antenna for underground pipe detector. 4,028,707, Cl. 343-719.000.
Young, Raymond Donald. Passing vehicle signalling apparatus. 4,028,662, Cl. 340-32.000.
Young, Robert G., to Sperry Rand Corporation. Wire guiding assembly on a baler. 4,027,815, Cl. 226-194.000.
Young, Teddy R.: *See—*
Lipp, Charles E.; and Young, Teddy R., 4,027,471.
Youngberg, Lynn Zaugg: *See—*
Johnston, Donald Leroy; Perkins, Manuel Garfield; and Youngberg, Lynn Zaugg, 4,027,669.
Youngers, Steve A.; and Erickson, Terry D., to J. I. Case Company. Frame structure for articulated vehicle. 4,027,913, Cl. 296-28.00J.
Yuan, Sun-Shine: *See—*
Bodor, Nicolae S.; and Yuan, Sun-Shine, 4,028,368.
Yugen Kaisha Watanabe Kenkyusho: *See—*
Watanabe, Katsumi, 4,027,887.
Yukinaga, Hisajiro; Sumimoto, Shinzaburo; Ishizuka, Ichiro; and Sugita, Jitsuo, to Shionogi & Co., Ltd. 3-Alkylisoxazole derivatives and herbicides containing them. 4,028,376, Cl. 260-307.00H.
Zaichenko, Mikhail Efimovich: *See—*
Gudzenko, Nikolai Vasilievich; Zaichenko, Mikhail Efimovich; and Larin, Konstantin Leonidovich, 4,028,009.
Zajic, James E.; and Volesky, Bohumil, to Canadian Patents and Development Limited. Microbiological synthesis of proteinaceous material employing normally gaseous hydrocarbon substrate and the products thereof. 4,028,182, Cl. 195-28.00R.
Zaker, Gregory A.: *See—*
Moricca, Larry S.; and Zaker, Gregory A., 4,028,502.
Zambrano, Nobile, Jr., to Gabriel Industries, Inc. Potter's wheel. 4,028,041, Cl. 425-459.000.
Zankl, Frank; Kirkham, Edward E.; Stobbe, Richard E.; and Schachte, John J., to Kearney & Trecker Corporation. Method of controlling an A.C. motor. 4,028,599, Cl. 318-227.000.
Zarouni, Alfred, to Bell Telephone Laboratories, Incorporated. Escrow telephone coin collection circuit and method. 4,028,494, Cl. 179-6.30R.
Zdor, Gennady Nikolaevich: *See—*
Chachin, Viktor Nikolaevich; Zdor, Gennady Nikolaevich; Zhuravsky, Alexandr Julyanovich; Golovkina, Elena Yakovlevna; and Shaduya, Vladimir Leontievich, 4,027,515.
Zebo, Timothy James: *See—*
LaMarche, Robert Ernest; May, Carl Jerome, Jr.; and Zebo, Timothy James, 4,028,496.
Zeder, Abraham. Theft deterring apparatus. 4,028,691, Cl. 340-280.000.
Zenith Radio Corporation: *See—*
Argy, Thomas W., 4,028,726.
Dougherty, Lawrence W., 4,028,580.
Zenitz, Bernard L., to Sterling Drug Inc. 2-Naphthyl-lower-alkanoylamines. 4,028,366, Cl. 260-293.620.
Zhuravsky, Alexandr Julyanovich: *See—*
Chachin, Viktor Nikolaevich; Zdor, Gennady Nikolaevich; Zhuravsky, Alexandr Julyanovich; Golovkina, Elena Yakovlevna; and Shaduya, Vladimir Leontievich, 4,027,515.
Zielinski, Robert Michael, Jr.: *See—*
Madland, Robert Christen; Zielinski, Robert Michael, Jr.; and Engstrom, Keith Allen, 4,028,696.
Zimmermann, Heino, to Gustav F. Gerdts KG. Electrode device for monitoring liquid levels. 4,027,534, Cl. 73-304.00R.
Zinsstag, Christoph; Kutschera, Heinz; and Knutti, Dietrich, to Lonza Ltd. Process for preventing lime deposits in a humidifier. 4,028,239, Cl. 210-58.000.
Zorn, Jean-Rene: *See—*
Sureau, Claude; Tournaire, Michel; Zorn, Jean-Rene; Sturbois, Gilbert; Chavinie, Jacques; Le Houezec, Roger; and Ripoche, Andre, 4,027,657.
Zschocke, Albrecht; Kummer, Horst; and Adolphi, Heinrich, to Badische Anilin- & Soda-Fabrik Aktiengesellschaft. Carbamate. 4,028,399, Cl. 260-479.00C.
Zuest, Harry, to Contraves AG. Liquid for a feeler element for the electrical measurement of inclinations. 4,028,260, Cl. 252-62.200.
Zuleeg, Rainer, to McDonnell Douglas Corporation. Negative impedance transistor device. 4,028,562, Cl. 307-303.000.
Zunker, Reinhard: *See—*
Rochlitz, Jurgen; and Zunker, Reinhard, 4,028,102.
Zurcher, Rudolf F., to Hughes Aircraft Company. Simplified tabulator keyboard assembly for use in watch/calculator having transparent foldable flexible printed circuit board with contacts and actuator indicia. 4,028,509, Cl. 200-5.00A.
Zygon Industries Limited: *See—*
Kingsley, Ernest James; and Mendgen, Horst Guenter, 4,027,856.

LIST OF DEFENSIVE PUBLICATIONS

APPLICANTS TO WHOM

DEFENSIVE PUBLICATIONS WERE ISSUED ON THE 7TH DAY OF JUNE, 1977

Published at the request of the applicant or owner in accordance with the Notice of Dec. 16, 1969, 869 O. G. 687.

Arter, Nelson Kay; Eichhorn, Thomas Franklin; and Jackson, Howard Carl. Dynamic deskewing for a rotating head recording device. T959,012, 6-7-77, Cl. 360-76.000.

Blount, William W., Jr.: *See—*
Suggs, James L.; and Blount, William W., Jr., T959,006.

Chandra, Bala Perampalam, to Imperial Chemical Industries Limited. Method of treating polymer latices. T959,008, 6-7-77, Cl. 528-500.000.

Clark, Robert Ellis. Spinneret. T959,002, 6-7-77, Cl. 75-126.00C.

Dilks, Charles Heritage, Jr.: *See—*
Kirklaod, Joseph Jack; and Dilks, Charles Heritage, Jr., T959,004.

Du Pont de Nemours, E. I., and Company: *See—*
Kirkland, Joseph Jack; and Dilks, Charles Heritage, Jr., T959,004.

Eichhorn, Thomas Franklin: *See—*
Arter, Nelson Kay; Eichhorn, Thomas Franklin; and Jackson, Howard Carl, T959,012.

Froot, Howard A.; and Singh, Vijendra P. Method of determining yield loss due to a combination of defects in manufacturing method utilizing same. T959,005, 6-7-77, Cl. 235-151.130.

Hansen, David R. Printing ink resin composition. T959,010, 6-7-77, Cl. 260-829.000.

Hull, Joan Helen. Electrostatic process development apparatus. T959,003, 6-7-77, Cl. 118-658.000.

Imperial Chemical Industries Limited: *See—*
Chandra, Bala Perampalam, T959,008.

Jackson, Howard Carl: *See—*
Arter, Nelson Kay; Eichhorn, Thomas Franklin; and Jackson, Howard Carl, T959,012.

Jones, Thomas M., to Tennessee Valley Authority. Production of suspension fertilizers from wet-process orthophosphoric acids. T959,001, 6-7-77, Cl. 71-34.000.

Kirkland, Joseph Jack; and Dilks, Charles Heritage, Jr., to Du Pont de Nemours, E. I., and Company. Chromatographic liquid dispensing inlet and method. T959,004, 6-7-77, Cl. 210-31.00C.

McConnell, Richard Leon; and Weemes, Doyle Allen. Process for powdering semi-crystalline polyester pellets. T959,009, 6-7-77, Cl. 260-75.00T.

Sanders, Robert R. Coating compositions. T959,007, 6-7-77, Cl. 260-16.000.

Singh, Vijendra P.: *See—*
Froot, Howard A.; and Singh, Vijendra P., T959,005.

Smith, Robert Clarence. Transparent high-impact polystyrene resins and their manufacture. T959,011, 6-7-77, Cl. 260-876.00B.

Suggs, James L.; and Blount, William W., Jr. Curing system for unsaturated materials. T959,006, 6-7-77, Cl. 526-14.000.

Tennessee Valley Authority: *See—*
Jones, Thomas M., T959,001.

Weemes, Doyle Allen: *See—*
McConnell, Richard Leon; and Weemes, Doyle Allen, T959,009.

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 7TH DAY OF JUNE, 1977

NOTE—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Aktiebolaget Electrolux: *See—*
Kilstrom, Lars Gunnar; and Ridderstrom, Goran Arvid Henning, Re. 29,247.

AMP Incorporated: *See—*
Fritz, William Baird, Re. 29,258.

Appenzeller, Valentin; and Kutz, Johannes, to Eduard Kuesters Maschinenfabrik. Means for continuous dyeing of pile warp textiles especially of carpets. Re. 29,251, Cl. 68-22.00R.

Bryson, James D.: *See—*
Kahle, Rolf D.; Studley, David K.; and Bryson, James D., Re. 29,254.

Congleton, Wayne, to Dolco Packaging Corporation. Container. Re. 29,248, Cl. 47-77.000.

Daghe, Joseph L.; and Stultz, Richard A., to Mueller Co. Valve operator for butterfly valves or the like. Re. 29,253, Cl. 251-228.000.

Dolco Packaging Corporation: *See—*
Congleton, Wayne, Re. 29,248.

Du Pont de Nemours, E. I., and Company: *See—*
McDowell, Maurice James, Re. 29,255.

Eduard Kuesters Maschinenfabrik: *See—*
Appenzeller, Valentin; and Kutz, Johannes, Re. 29,251.

Fritz, William Baird, to AMP Incorporated. Coated ferrite RF filters. Re. 29,258, Cl. 333-70.00S.

Huyen, Vu-Ngoc: *See—*
Joullie, Maurice L.; Maillard, Gabriel; Lakah, Lucien; Muller, Pierre; and Huyen, Vu-Ngoc, Re. 29,256.

Joullie, Maurice L.; Maillard, Gabriel; Lakah, Lucien; Muller, Pierre; and Huyen, Vu-Ngoc, to Recherche Pharmaceutiques et Scientifiques. Digestive pharmaceutical composition comprising S-carboxymethyl cysteine for reducing viscosity of respiratory tract secretions, and method of treating therewith. Re. 29,256, Cl. 424-311.000.

Kabushiki Kaisha Suwa Seikosha: *See—*
Tanaka, Kojiro, Re. 29,250.

Kahle, Rolf D.; Studley, David K.; and Bryson, James D., to Quantor Corporation. Microfiche recorder and processor. Re. 29,254, Cl. 355-28.000.

Kilstrom, Lars Gunnar; and Ridderstrom, Goran Arvid Henning, to Aktiebolaget Electrolux. Surface treating attachment device. Re. 29,247, Cl. 15-380.000.

Kostelec, Joze, to North American Philips Corporation. Gated silicon diode array camera tube. Re. 29,261, Cl. 357-31.000.

Kutz, Johannes: *See—*
Appenzeller, Valentin; and Kutz, Johannes, Re. 29,251.

Lakah, Lucien: *See—*
Joullie, Maurice L.; Maillard, Gabriel; Lakah, Lucien; Muller, Pierre; and Huyen, Vu-Ngoc, Re. 29,256.

Litchford, George B., to Litchstreet Co. Proximity indication with range and bearing measurements. Re. 29,260, Cl. 343-16.00R.

Litchstreet Co.: *See—*
Litchford, George B., Re. 29,260.

Maillard, Gabriel: *See—*
Joullie, Maurice L.; Maillard, Gabriel; Lakah, Lucien; Muller, Pierre; and Huyen, Vu-Ngoc, Re. 29,256.

McDowell, Maurice James, to Du Pont de Nemours, E. I., and Company. Photographic layers containing perfluoro compounds and coating thereof. Re. 29,255, Cl. 96-87.00R.

Miller, Bob C. Sequencing valve. Re. 29,252, Cl. 137-119.000.

Motorola, Inc.: *See—*
Nash, Harold G.; and Wiles, Michael F., Re. 29,257.

Mueller Co.: *See—*
Daghe, Joseph L.; and Stultz, Richard A., Re. 29,253.

Muller, Pierre: *See—*
Joullie, Maurice L.; Maillard, Gabriel; Lakah, Lucien; Muller, Pierre; and Huyen, Vu-Ngoc, Re. 29,256.

Nash, Harold G.; and Wiles, Michael F., to Motorola, Inc. Digital filter for a digital demodulation receiver. Re. 29,257, Cl. 235-152.000.

North American Philips Corporation: *See—*
Kostelec, Joze, Re. 29,261.

Quantor Corporation: *See—*
Kahle, Rolf D.; Studley, David K.; and Bryson, James D., Re. 29,254.

Recherche Pharmaceutiques et Scientifiques: *See—*
Joullie, Maurice L.; Maillard, Gabriel; Lakah, Lucien; Muller, Pierre; and Huyen, Vu-Ngoc, Re. 29,256.

Rice, Edward K., to Unicon Parking Structures, Inc. Precast concrete building construction. Re. 29,249, Cl. 52-227.000.

Ridderstrom, Goran Arvid Henning: *See—*
Kilstrom, Lars Gunnar; and Ridderstrom, Goran Arvid Henning, Re. 29,247.

Sabsay, Daniel M. Self re-keying security device. Re. 29,259, Cl. 340-149.00A.

Studley, David K.: *See—*
Kahle, Rolf D.; Studley, David K.; and Bryson, James D., Re. 29,254.

Stultz, Richard A.: *See—*
Daghe, Joseph L.; and Stultz, Richard A., Re. 29,253.

Tanaka, Kojiro, to Kabushiki Kaisha Suwa Seikosha. Digital electronic watch having calendar display arrangement. Re. 29,250, Cl. 58-58.000.

Unicon Parking Structures, Inc.: *See—*
Rice, Edward K., Re. 29,249.

Wiles, Michael F.: *See—*
Nash, Harold G.; and Wiles, Michael F., Re. 29,257.

LIST OF DESIGN PATENTEES

Aktiesclskabet Brodrene Hartmann: *See—*
Petersen, Jorgen Nilaus, 244,582.

Albanese, Gregory Ralph: *See—*
Bocskay, Wilhelmina, 244,567.

American Optical Corporation: *See—*
Johnsen, David W., 244,603.

Anchor Hocking Corporation: *See—*
Thrush, James Lloyd, 244,573.

Andrews, James S., to Magrath Company, The. Head for a cattle prod or similar article. 244,626, 6-7-77, Cl. D30-32.000.

Artmann, John A.; and Tweedie, Thomas D., to Samsonite Corporation. Tote bag. 244,638, 6-7-77, Cl. D87-3.00F.

Avent, Richard A. Pressure vessel for fire extinguishers or the like. 244,578, 6-7-77, Cl. D9-158.000.

Balenciaga S.A.: *See—*
Dinand, Pierre Francois, 244,579.

Ball, Robert F. Candle cup. 244,633, 6-7-77, Cl. D48-2.000.

Barish, Robert A., to Johnson & Johnson. Dispensing container. 244,583, 6-7-77, Cl. D9-236.000.

Bocskay, John Cornelius: *See—*
Bocskay, Wilhelmina, 244,567.

Bocskay, Wilhelmina, to Albanese, Gregory Ralph; and Bocskay, John Cornelius. Display hat. 244,567, 6-7-77, Cl. D2-244.000.

Boord, James O., to Champion Spark Plug Company. Spark plug gap measuring and adjusting tool. 244,586, 6-7-77, Cl. D10-64.000.

Booth, Vernard S., to Olinkraft, Inc. Boz blank. 244,584, 6-7-77, Cl. D9-245.000.

Bowes, Stephen M., Jr., to Florida Machine & Foundry Co. Tooth for dredge cutter head or the like. 244,597, 6-7-77, Cl. D15-29.000.

Braid, Malcolm R. Aquarium. 244,621, 6-7-77, Cl. D30-6.000.

Braid, Malcolm R. Aquarium. 244,622, 6-7-77, Cl. D30-6.000.

Braid, Malcolm R. Aquarium. 244,623, 6-7-77, Cl. D30-6.000.

Braid, Malcolm R. Aquarium. 244,624, 6-7-77, Cl. D30-6.000.

Braid, Malcolm R. Aquarium. 244,625, 6-7-77, Cl. D30-6.000.

Breger, Carl-Arne, to Telefonaktiebolaget L M Ericsson. Telephone instrument. 244,617, 6-7-77, Cl. D14-53.000.

Broughton, Sidney Hubert: *See—*
Gilmore, Jack Arthur; Burgess, Garry Mitchell; Broughton, Sidney Hubert; and Rowland, Martha Jane, 244,614.

Bulldog Toy Company Limited: *See—*
Kyte, Eric, 244,631.

Burgess, Garry Mitchell: *See—*
Gilmore, Jack Arthur; Burgess, Garry Mitchell; Broughton, Sidney Hubert; and Rowland, Martha Jane, 244,614.

Burns, Edgar, to International Telephone and Telegraph Corporation. Electrical connector retaining clip. 244,612, 6-7-77, Cl. D13-24.000.

Cain, Robert M.: *See—*
Endres, Wayne C.; and Cain, Robert M., 244,575.

Campbell, Ian R.: *See—*
Krawagna, Alois, 244,630.

Candiliotis, Gerassimos C., to Uniroyal Inc. Pneumatic tire tread and buttress. 244,594, 6-7-77, Cl. D12-147.000.

Champion Spark Plug Company: *See—*
Boord, James O., 244,586.

Chodorow, Ingram S., to Placontrol, Inc. Dental floss holder. 244,609, 6-7-77, Cl. D28-64.000.

Christiansen, Godtfred Kirk, to Interlego A.G. Toy construction piece. 244,632, 6-7-77, Cl. D34-15.0GG.

Coats Company, Inc., The: *See—*
Cunningham, Charles L.; and Holladay, Jimmie L., 244,599.
Cunningham, Charles L.; and Holladay, Jimmie L., 244,600.
Cunningham, Charles L.; and Holladay, Jimmie L., 244,601.

Cocuzzo, Joseph G. Bass drum stabilizer or similar article. 244,636, 6-7-77, Cl. D56-1.00E.

Cohen, Martin B. Combined guiro and shaker. 244,635, 6-7-77, Cl. D56-1.00E.

Cowan, Walter L., Jr. Stand for potted plants. 244,571, 6-7-77, Cl. D6-183.000.

Cudmore, Patrick J., to Wave-Rider, Incorporated. Hanging birdhouse. 244,620, 6-7-77, Cl. D30-3.000.

Cunningham, Charles L.; and Holladay, Jimmie L., to Coats Company, Inc., The. Tire changer or similar article. 244,599, 6-7-77, Cl. D15-199.000.

Cunningham, Charles L.; and Holladay, Jimmie L., to Coats Company, Inc., The. Tire changer or similar article. 244,600, 6-7-77, Cl. D15-199.000.

Cunningham, Charles L.; and Holladay, Jimmie L., to Coats Company, Inc., The. Tire changer or similar article. 244,601, 6-7-77, Cl. D15-199.000.

Day, Albert J.: *See—*
Molyneux, Jane K.; Day, Albert J.; Day, Regina M.; and Kaiser, Theo E., 244,587.

Day, Regina M.: *See—*
Molyneux, Jane K.; Day, Albert J.; Day, Regina M.; and Kaiser, Theo E., 244,587.

Dinand, Pierre Francois, to Balenciaga S.A. Perfume bottle. 244,579, 6-7-77, Cl. D9-167.000.

Dynamic Instrumeot Corporation: *See—*
Gietzen, James J., 244,610.
Gietzen, James J., 244,611.

Economics Laboratory, Inc.: *See—*
Nystuen, David L.; Moffatt, Robert B.; and Imdieke, Thomas H., 244,598.

Keough, David G., 244,580.
Keough, David G., 244,581.
Patterson, Dennis C.: *See—*
Manofsky, William L.; and Patterson, Dennis C., 244,593.
Petersen, Jorgen Nilaus, to Aktieselskabet Brodrene Hartmann. Egg carton. 244,582, 6-7-77, Cl. D9-190.000.
Placontrol, Inc.: *See—*
Chodorow, Ingram S., 244,609.
Proctor, Douglas B. I. Sailing boat. 244,592, 6-7-77, Cl. D12-64.000.
Rabinovitz, Leonard: *See—*
Lepisto, Morris G.; and Rabinovitz, Leonard, 244,568.
Ratnik, H. Ronald. Frostproof hydrant. 244,605, 6-7-77, Cl. D23-12.000.
Riley, Harry John, to S. W. Hart & Co. Pty. Ltd. Solar water heating unit. 244,606, 6-7-77, Cl. D23-127.000.
Riley, Harry John, to S. W. Hart & Co. Pty. Ltd. Solar water heating unit. 244,607, 6-7-77, Cl. D23-127.000.
Riley, Harry John, to S. W. Hart & Co. Pty. Ltd. Solar water heating unit. 244,608, 6-7-77, Cl. D23-127.000.
Roberts, Charles W.: *See—*
Fetty, Harold D.; and Roberts, Charles W., 244,596.
Rosenfeld, Stanley M. Finger ring setting. 244,589, 6-7-77, Cl. D11-34.000.
Rosenfeld, Stanley M. Finger ring setting. 244,590, 6-7-77, Cl. D11-34.000.
Rowland, Martha Jane: *See—*
Gilmore, Jack Arthur; Burgess, Garry Mitchell; Broughton, Sidney Hubert; and Rowland, Martha Jane, 244,614.
Ryan, Vernon L. Playground seat. 244,627, 6-7-77, Cl. D34-5.00L.
S. W. Hart & Co. Pty. Ltd.: *See—*
Riley, Harry John, 244,606.
Riley, Harry John, 244,607.
Riley, Harry John, 244,608.
Samsonite Corporation: *See—*
Artmann, John A.; and Tweedie, Thomas D., 244,638.
Schwartz, Frederick J. Watch face. 244,588, 6-7-77, Cl. D10-126.000.
Sizer, Stuart Walter, to Heath Company. Power amplifier. 244,616, 6-7-77, Cl. D14-96.000.
Sottsass, Ettore, Jr., to Ing. C. Olivetti & C., S.p.A. Desk-top accounting terminal. 244,613, 6-7-77, Cl. D14-45.000.
Sunbeam Corporation: *See—*
Long, Douglas George, 244,640.
Tamarin, Bernard J., to Vacuum Cleaner Corporation of America, The. Lamp guard. 244,634, 6-7-77, Cl. D48-16.00B.
Taylor, Don A. Combined merchandise display counter and ceiling air circulator. 244,570, 6-7-77, Cl. D6-153.000.
Tektronix, Inc.: *See—*
Gilmore, Jack Arthur; Burgess, Garry Mitchell; Broughton, Sidney Hubert; and Rowland, Martha Jane, 244,614.
Telefonaktiebolaget L M Ericsson: *See—*
Breger, Carl-Arne, 244,617.
Thrush, James Lloyd, to Anchor Hocking Corporation. Bowl or similar article. 244,573, 6-7-77, Cl. D7-5.000.
Tohnichi Manufacturing Co., Ltd.: *See—*
Tsuji, Hiroshi, 244,574.
Toth, Richard John: *See—*
Goldman, Arnold Sherwin; and Toth, Richard John, 244,618.
Tsuji, Hiroshi, to Tohnichi Manufacturing Co., Ltd. Torque wrench. 244,574, 6-7-77, Cl. D8-24.000.
Tweedie, Thomas D.: *See—*
Artmann, John A.; and Tweedie, Thomas D., 244,638.
Uniroyal Inc.: *See—*
Candiliotis, Gerassimos C., 244,594.
Vacuum Cleaner Corporation of America, The: *See—*
Tamarin, Bernard J., 244,634.
Van Alstine, Guy A. Handle for a tire cutting tool. 244,576, 6-7-77, Cl. D8-107.000.
Wave-Rider, Incorporated: *See—*
Cudmore, Patrick J., 244,620.
Wolfe, Donald G.: *See—*
Mango, Joseph R.; and Wolfe, Donald G., 244,602.
Wood, Herron & Evans: *See—*
Mariol, James F., 244,615.
Wright, Forrest S. Dumbbell. 244,628, 6-7-77, Cl. D34-5.00K.
Wright, Forrest S. Barbell. 244,629, 6-7-77, Cl. D34-5.00K.
Yurkovich, Charles G.; and Fetty, Harold D., to Goodyear Tire & Rubber Company, The. Tire. 244,595, 6-7-77, Cl. D12-147.000.

CLASSIFICATION OF PATENTS

ISSUED JUNE 7, 1977

PRINTED COPIES OF PATENTS are furnished by the Patent and Trademark Office at 50 cents each; PLANT PATENTS in color, $1.00 each; copies of TRADEMARKS AND DESIGN PATENTS at 20 cents each. Address orders to the Commissioner of Patents and Trademarks, Washington, D.C., 20231.

Printing authorized by Section 11(a)3 of Title 35, U.S. Code P.T.O.

PATENT AND TRADEMARK OFFICE NOTICES

TITLE 37—PATENTS, TRADEMARKS AND COPYRIGHTS

Chapter 1—Patent and Trademark Office

PART 3—FORMS FOR PATENT CASES

AGENCY: Patent and Trademark Office, Commerce

ACTION: Final rule

SUMMARY: Patent and Trademark Office amends Forms for Patent Cases to assist applicants and other parties in complying with changes previously made in the Rules in Patent Cases.

DATES: Effective date -- June 30, 1977.

A period of 60 days after publication of this notice in the Federal Register is set for written comment by the public. The Patent and Trademark Office will evaluate the changes in light of the written comments received within 60 days after the close of the period for comment. The Office will then publish in the Federal Register and Official Gazette an indication of its adherence to or alteration in the forms as here published, as well as any reply to any especially significant comments received.

FOR FURTHER INFORMATION CONTACT: Mr. Louis O. Maassel by telephone at (703) 557-3079, or by mail marked to his attention and addressed to the Commissioner of Patents and Trademarks, Washington, D. C. 20231.

SUPPLEMENTARY INFORMATION:

The Patent and Trademark Office is amending Title 37 of the Code of Federal Regulations by deleting §§3.1, 3.2, 3.3, 3.4, 3.5, 3.6, 3.7, 3.21, and 3.25 since §1.61, which required a petition, was revoked on July 2, 1971, by revising §§3.11, 3.11a, 3.12, 3.12a, 3.13, 3.13a, 3.14, 3.14a, 3.16, 3.16a, 3.17, 3.17a, 3.18, 3.18a, 3.23, 3.23a, 3.26, 3.26a, 3.28, 3.29, 3.31, 3.31a, 3.32, 3.32a, 3.33, 3.36, 3.37, 3.39, 3.41, 3.43, 3.46, 3.50, 3.52, 3.53, and 3.54 and by adding a new §3.33a. These sections are suggested forms for use in patent cases.

These revisions conform the language of the forms, where necessary, to changes which have previously been made in Part 1 of this Chapter and also alter the language in the forms where incorrect or inconsistent. These revisions do not effect any changes in practice and do not impose a burden on anyone. Consequently, procedures for public comment prior to the adoption of these revisions are not deemed necessary.

The general nature of the changes in the forms are as follows:

1. The oath and declaration forms for patent applications have been amended to include a reference to the filing and issuance of inventor's certificates. Such a requirement is set forth in current sections 1.65 and 1.67 of Title 37 CFR.

2. The oath and declaration forms for patent applications have been amended to include the statement by applicant acknowledging the responsibility to disclose information to the Patent and Trademark Office. Such statement will be required by section 1.65 effective January 1, 1978, but may optionally be used prior to that date, as suggested in the notice published on January 28, 1977, in the Federal Register, 42 F.R. 5588 at 5590, and on February 22, 1977, in the Official Gazette (Patent Section), 955 O.G. 1054 at 1056.

3. "United States" has been changed to --United States of America-- to give the full name.

4. In many instances the forms were changed to avoid use of only the masculine gender.

Sections 3.28 and 3.29 have been revised to omit the obsolete requirement for a petition.

Section 3.41 has been revised to delete requirements no longer needed under current internal procedures.

Section 3.52 has been amended by reordering the items and by deletion of an outdated item.

Section 3.54 is a revised version of the wording currently found in Section 201.06(a) of the Manual of Patent Examining Procedure.

Pursuant to the authority contained in section 6 of Title 35, United States Code, the following changes are made in Part 3 of Chapter I of Title 37 of the Code of Federal Regulations.

1. The Table of Contents to Part 3 is revised to read as follows:

PART 3 -- FORMS FOR PATENT CASES

3.1 (Deleted)
3.2 (Deleted)
3.3 (Deleted)
3.4 (Deleted)
3.5 (Deleted)

3.25 (Deleted)
3.26 Plant patent application; oath.
3.26a Plant patent application; declaration.
3.28 Reissue application by the inventor, offer to surrender.
3.29 Reissue application by the assignee, offer to surrender.
3.31 Reissue application, oath; by the inventor.
3.31a Reissue application, declaration; by inventor.
3.32 Reissue application, oath; by assignee.
3.32a Reissue application, declaration; by assignee.
3.33 Oath as to loss of letters patent.
3.33a Declaration as to loss of letters patent.
3.36 Power of attorney or authorization of agent, not accompanying application.
3.37 Revocation of power of attorney or authorization of agent.
3.39 Amendment.
3.41 Notice of appeal from the Primary Examiner to the Board of Appeals.
3.43 Disclaimer in patent.
3.44 Interference; preliminary statement of domestic inventor.
3.45 Interference; preliminary statement of foreign inventor.
3.46 Interference; disclaimer during interference.
3.47 Interference; notice of taking testimony.
3.48 Interference; form of deposition.
3.49 Interference; certificate of officer.
3.50 Waiver of patent rights under §1.139.
3.51 Application transmittal letter.
3.52 Amendment transmittal letter.
3.53 Terminal disclaimer in application.
3.54 Division-continuation program application transmittal form.
3.61 Symbols for draftsmen.

AUTHORITY: The provisions of this Part 3 issued under 35 U.S.C. 6, unless otherwise noted.

NOTE: The following forms illustrate the manner of preparing various papers to be filed in the Patent and Trademark Office. Applicants and other parties will find their business facilitated by following them. In special situations such alterations as the circumstances may render necessary may be made provided they do not depart from the requirements of Part 1 of this chapter or of the statute. Before using any form the pertinent sections of Part 1 and sections of the statute should be studied carefully.

2. Section 3.1 is deleted.

3. Section 3.2 is deleted.

4. Section 3.3 is deleted.

5. Section 3.4 is deleted.

6. Section 3.5 is deleted.

7. Section 3.6 is deleted.

8. Section 3.7 is deleted.

9. Section 3.11 is revised to read as follows:

§3.11 Oath to accompany application for patent.

As a below named inventor, being duly sworn (or affirmed), I depose and say that:

my residence, post office address and citizenship are as stated below next to my name; that

I verily believe I am the original, first and sole inventor (if only one name is listed below) or a joint inventor (if plural inventors are named below) of the invention entitled: _____

described and claimed in the attached specification; that

I do not know and do not believe that the same was ever known or used in the United States of America before my or our invention thereof, or patentad or described in any printed publication in any country before my or our invention thereof or more than one year prior to this application, that the same was not in public use or on sale in the United States of America more than one year prior to this application, that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representatives or assigns more than twelve months prior to this application, that I acknowledge my duty to disclose information of which I am aware which is material to the examination of this application, and that no application for patent or inventor's certificate on this invention has been filed in any country foreign to the United States of America prior to this application by me or my legal representatives or assigns, except as follows: _____

Full name of sole or first Inventor _____

Inventor's signature _____ Date _____

Residence _____

Citizenship _____

Post Office Address _____

16. Section 3.14a is revised to read as follows:

§3.14a Supplemental declaration for amendment presenting claims for matter disclosed but not originally claimed.

I, _____(name)_____, the inventor named in the application for letters patent for an improvement in _____, Serial No. _____, filed in the United States Patent and Trademark Office on or about the _____ day of _____,

19___, declare that the subject matter of the foregoing (1) amendment was part of my invention, was invented before the filing of the original application, above identified, for such invention; that I do not know and do not believe that the same was ever known or used in the United States of America before my invention thereof, or patented or described in any printed publication in any country before my invention thereof, or more than one year before said application, or in public use or on sale in the United States of America more than one year before the date of said application, that said invention has not been patented or made the subject of an inventor's certificate issued before the date of said application in any country foreign to the United States of America on an application filed by me or my legal representatives or assigns more than twelve months prior to said application in the United States of America, and has not been abandoned.

I further declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

I, (full name of signer), residing at _____ in the county of _____ and State of _____ represent that I am (here state exact interest of the disclaimant and, if an assignee, set out the liber and page or reel and frame where the assignment is recorded) of application Serial No. _____, filed on the _____ day of _____, 19__ for _____. I hereby discleim the terminal part of any patent granted on the above-identified application, which would extend beyond the expiration date of Patent No. _____ and hereby agree that any patent so granted on the above-identified

application shall be enforceable only for and during such period that the legal title to said patent shall be the same as the legal title to United States Patent No. ____ _____, this agreement to run with any patent granted on the above-identified application and to be binding upon the grantee, its successors or assigns.

_____ (Date) _____ (Signature)

45. Section 3.54 is revised to read as follows:

§3.54 Division-continuation program application transmittal form.

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Docket No. _____

Anticipated Classification of this application:

Class ____ Subclass ____

Prior application:

Examiner _____

Art Unit _____

THE COMMISSIONER OF PATENTS AND TRADEMARKS

Washington, D.C. 20231.

Sir: This is a request for filing a [ ] continuation [ ] divisional application, under 37 CFR 1.60, of pending prior application Serial No. _____ filed on _____ (Date) of _____ (Inventor currently of record in prior application) for _____ (title of invention).

1. [ ] Enclosed is a copy of the prior application, including the oath or declaration as originally filed.

I hereby verify that the attached papers are a true copy of prior application Serial No. _____ as originally filed on _____ (date), and further that this statement was made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

2. [ ] Prepare a copy of the prior application.

3. [ ] The filing fee is calculated below:

CLAIMS AS FILED IN THE PRIOR APPLICATION, LESS ANY CLAIMS CANCELLED BY AMENDMENT BELOW

For	Number filed	Number Extra	Rate	Fee
Total claims	-10*		x$2*	
Independent Claims	- 1*		x10*	
Basic Fee (minimum amount required)				$55.00
Total filing fee				

4. [ ] The Commissioner is hereby authorized to charge any fees which may be required, or credit any overpayment to Account No. _____. A duplicate copy of this sheet is enclosed.

5. [ ] A check in the amount of $_____ is enclosed.

6. [ ] Cancel in this application original claims ____ _____ of the prior application before calculating the filing fee. (At least one original independent claim must be retained for filing purposes.)

7. [ ] Amend the specification by inserting before the first line the sentence: --This is a [ ] continuation, [ ] division, of application serial no. _____, filed _____.

8. [ ] Transfer the drawings from the prior application to this application and abandon said prior application as of the filing date accorded this application. A duplicate copy of this sheet is enclosed for filing in the prior application file. (May only be used if signed by person authorized by §1.138 and before payment of base issue fee.)

8a. [ ] New formal drawings are enclosed.

8b. [ ] Priority of application serial no. _____ filed on _____ in _____ (country) is claimed under 35 U.S.C. 119.

[ ] The certified copy of the priority application has been filed in prior application serial no. ____ _____, filed _____.

9. [ ] The prior application is assigned of record to ____ _____.

10. [ ] The power of attorney in the prior application is to _____ (name, registration number, and address).

a. [ ] The power appears in the original papers in the prior application.

b. [ ] Since the power does not appear in the original papers, a copy of the power in the prior application is enclosed.

c. [ ] Address all future communications to ____ _____.

(May only be completed by applicant, or attorney or agent of record.)

_____ (date) _____ (signature)

Address of signer:

_____

_____

[ ] Inventor(s)

[ ] Assignee of complete interest

[ ] Attorney or agent of record

[ ] Filed under §1.34(a)

Patent Suits

Notices under 35 U.S.C. 290; Patent Act of 1952

2,830,343, H. F. Shroyer, CAVITYLESS CASTING MOLD AND METHOD OF MAKING SAME; **3,314,116,** Wittmoser, Schade and Krzyanowski, GASIFIABLE CASTING PATTERN; **3,498,360,** same, METHOD OF CASTING IN A MOLD WHICH IS COATED DURING CASTING, **filed** Jan. 10, 1977, D.C., E.D. Mich. (Bay City) Doc. 77-10003, *Thunder Bay Manufacturing Corporation* v. *Full Mold Process, Inc.*

2,976,257, Dawe and Youse, RE-DISPERSIBLE DISPERSION OF POLYTETRAFLUOROETHYLENE, **filed** June 28, 1974, D.C., S.D.N.Y., Doc. 74-2812, *Wallace Clark & Co., Inc.* v. *Acheson Industries, Inc.* Judgment in favor of defendant, entered Jan. 19, 1977.

3,040,968, Long and Crane, WRAPPER FOR PACKAGED PRODUCE, **filed** Apr. 16, 1976, D.C., N.D. Tex. (Dallas) Doc. CA-3-76-0343, *Standun, Inc.* v. *Safeway Stores, Incorporated.* Case is dismissed without prejudice, Jan. 28, 1977.

3,056,719, D. R. Webster, CONTINUOUS WEB FORMING MACHINE, **filed** Mar. 19, 1975, D.C. Del. (Wilmington) Doc. 75-72, *David R. Webster and Aktiebolaget Karlstads Mekaniska Werkstad* v. *Belait Corporation.* The above action is dismissed pursuant to Rule 41(a)(1)(ii) of the Federal Rules of Civil Procedure, Jan. 26, 1977.

3,090,605, Copeland and Neier, FEED MIXER, **filed** Jan. 27, 1977, D.C. Minn. (Minneapolis) Doc. 4-77-C 35, *B/J Manufacturing Co., Inc.* v. *Van Dale, Inc.*

3,311,116. (See 2,830,343.)

3,341,021, K. H. Casson, MAGNETIC SEPARATOR, **filed** Sept. 9, 1976, D.C., N.D. Ill. (Chicago) Doc. 76c3358, *Barnes Drill Co.* v. *Chemaperm Magnetics Inc.*

3,381,801, B. Rastoin, FLEXIBLE CONVEYOR, **filed** June 30, 1976, D.C.N.J. (Newark) Doc. 76-1264, *Transitube Inc.* v. *Flexicon Inc. and William Gill.* Order of dismissal of action, July 1, 1976.

3,399,442, Jones and Greubel, CUTTING INSERT; **3,557,416,** D. G. Jones, **filed** Aug. 18, 1975, D.C., N.D. Ill. (Chicago) Doc. 75c2778, *Kennametal, Inc.* v. *Fansteel Inc.* Defendant is permanently enjoined from infringement, and case is dismissed, entered Jan. 28, 1977.

3,427,997, Brown, Jr., Butler, Carter, Ferik and Ogle, INFLATABLE BULKHEAD FOR RAILROAD CAR; **Re. 27,615,** same, **filed** Feb. 2, 1977, D.C., C.D. Calif. (Los Angeles) Doc. 77-03S6-LEW, *Prcco Incorporated* v. *General Foods Corporation, etc. et al.*

3,478,746, W. Greatbatch, CARDIAC IMPLANTABLE DEMAND PACEMAKER, **filed** Feb. 4, 1977, D.C. Minn. (Minneapolis) Doc. 4-77-C 55, *Cordiac Pacemakers, Inc.* v. *Medtronic, Inc.*

3,498,360. (See 2,S30,343.)

3,557,416. (See 3,399,442.)

3,563,763, Schwall, Rogers and Corbin, SELF-BASTING POULTRY PRODUCTS; **3,835,223,** same, SELF-BASTING POULTRY PRODUCT AND METHOD OF PREPARATION, **filed** June 30, 1976, D.C., N.D. Ill. (Chicago) Doc. 76c239S, *Armour and Company* v. *Hillman's, Inc., Topco Associates, Inc. and Jennie-O-Foods, Inc.* Enter order dismissing counts 1, 2 and 3 of the complaint with prejudice pursuant to stipulation of the parties, Jan. 21, 1977.

3,625,793, Sheridan and Jackson, BALLOON-TYPE CATHETERS AND METHOD OF MANUFACTURE, **filed** Oct. S, 1976, D.C. Pa. (Philadelphia) Doc. 76-3141, *Mallinckrodt Inc.* v. *Air Products and Chemicals Inc. and The Foregger Company, Inc.* Defendants hereby are enjoined and restrained from manufacturing cuffed endotracheal tubes of the kind identified in Exhibit A, Jan. 31, 1977.

3,650,766, Y. Smadar, EXTRUDED FOOD PRODUCTS AND METHOD OF PRODUCING SAME, **filed** Oct. 14, 1976, D.C. Md. (Baltimore) Doc. K-76-1543, *DCA Food Industries, Inc.* v. *Old Salt Seafood Co., Inc.* Case dismissed without prejudice, Feb. 1, 1977.

3,736,584, Hackett and Goble, MOTION DETECTOR AND INTRUDER ALARM SYSTEM, **filed** Jan. 26, 1977, D.C., N.D. Ill. (Chicago) Doc. 77c286, *Pittway Corporation* v. *Detection Systems, Inc. and Westinghouse Security Systems Corporation.*

3,756,296, R. F. West, HANDSAW, **filed** May 28, 1976, D.C. Conn. (Hartford) Doc. H76-218, *The Stanley Works* v. *Consolidated Foods Corp.* Consent judgment entered Feb. 4, 1977.

3,765,015, R. H. Gruner, SWITCH MONITORING CIRCUITRY, **filed** Oct. 23, 1973, D.C. Del. (Wilmington) Doc. 4749, *Data General Corporation* v. *Digital Computer Controls, Inc.* Pursuant to Rule 41(a)(1)(ii), by stipulation this action is hereby dismissed, Feb. 1, 1977.

3,835,223. (See 3,563,763.)

3,877,206, Cody and Sites, MOWING MACHINE, **filed** Sept. 18, 1975, D.C., M.D. Fla. (Orlando) Doc. 75-308-Orl-C-R, *Cosmos Futura, Inc. et al.* v. *Tresca Industries, Inc.* Joint stipulation to dismiss complaint and counterclaim, Feb. 4, 1977.

3,878,903, M. D. Cherrington, APPARATUS AND PROCESS FOR DRILLING UNDERGROUND ARCUATE PATHS; **3,894,402,** same, APPARATUS AND METHOD FOR EMPLACING A CONDUIT ALONG AN UNDERGROUND ARCUATE PATH; **3,967,689,** same, REAMING APPARATUS, **filed** Jan. 27, 1977, D.C., E.D. Tex. (Sherman) Doc. S-77-S-CA, *Tidril Corporation* v. *Martin D. Cherrington.*

3,889,639, Simon and Butz, BLOW-MOLDED DRUM, **filed** Jan. 26, 1977, D.C., C.D. Calif. (Los Angeles) Doc. CV77-0311-RMT, *Advanced Chemical Technology* v. *Born Free Plastics, Inc.*

3,894,402. (See 3,878,903.)

3,924,750, R. S. Dunchock, EYEGLASS DISPLAY UNIT, **filed** May 13, 1976, D.C., N.D. Calif. (San Francisco) Doc. C76-981-CBR, *Optarac Corp.* v. *Optivest Corp. and Farrell Optical Instruments, Inc.* Defendants are hereby permanently enjoined against infringing said patent, Feb. 3, 1977.

3,967,689. (See 3,878,903.)

3,979,148, W. Martin, WINDOW FRAME APPARATUS FOR VEHICLES, **filed** Jan. 28, 1977, D.C., C.D. Calif. (Los Angeles) Doc. CV77-0340-RJK, *Martin Shower Door Company, Inc.* v. *West Custom Windows Incorporated.*

Re. 27,615. (See 3,427,997.)

REISSUE APPLICATIONS FILED

Notice under 37 CFR 1.11(b). The reissue applications listed below are open to inspection by the general public in the indicated Examining Groups and copies may be obtained by paying the fee therefor (37 CFR 1.21(b)).

3,719,031, Re. S.N. 781,897, Filed Mar. 28, 1977, Cl. 55/136, ELECTRIC FIELD DIRECTED CONTROL OF DUST IN ELECTROSTATIC PRECIPITATORS, Peter C. Gelfand, Owner of Record: *Envirotech Corporation, Salt Lake City, Utah,* Attorney or Agent: Thomas S. MacDonald, et al., Ex. Gp.: 177

3,742,908, Re. S.N. 798,321, Filed May 19, 1977, Cl. 119/15, ANIMAL HABITAT, Dennis H. Merino, Owner of Record: *Mattel, Inc., Hawthorne, Calif.,* Attorney or Agent: Stephen L. King, et al., Ex. Gp.: 333

3,769,424, Re. S.N. 790,155, Filed Apr. 22, 1977, Cl. 424/317, COMPOSITION AND METHOD OF TREATING DOPAMINE DEFICIENCY IN BRAIN TISSUE, Gilbert M. Bayne, Owner of Record: *Merck & Co., Inc., Rahway, N.J.,* Attorney or Agent: Carroll G. Harper, et al., Ex. Gp.: 125

3,853,862, Re. S.N. 780,312, Filed Mar. 23, 1977, Cl. 260/243 R, PRODUCTION OF 4-HYDROXY-1,2-BENZOTHIAZINE-3-CARBOXAMIDES, Joseph G. Lombardino, Owner of Record: *Pfizer Inc., New York, N.Y.,* Attorney or Agent: Nicholas E. Oglesby, et al., Ex. Gp.: 121

3,876,420, Re. S.N. 786,037, Filed Apr. 8, 1977, Cl. 75/27, THERMAL INSULATION MOLTEN METAL, Richard C. Phoenix, et al., Owner of Record: *Foseco Trading A.G., Chur, Switzerland,* Attorney or Agent: John W. Malley, et al., Ex. Gp.: 223

3,885,205, Re. S.N. 786,371, Filed Apr. 11, 1977, Cl. 318/302, CONTROLLED ROTOR MOTOR, Robert Helmer, Owner of Record: *Enercon Corporation, Setauket, N.Y.,* Attorney or Agent: Jordan B. Bierman, et al., Ex. Gp.: 217

3,902,920, Re. S.N. 787,533, Filed Apr. 14, 1977, Cl. 429/89, PHOTOVOLTAIC CELL, John F. Jordan, et al., Owner of Record: *Photon Power, Inc., Wilmington, Del.,* Attorney or Agent: Edmund F. Bard, et al., Ex. Gp.: 114

3,920,021, Re. S.N. 783,853, Filed Apr. 1, 1977, Cl. 128/303.17, COAGULATING DEVICES, Siegfried Hiltebrandt, Owner of Record: *Richard Wolf GmbH, Knittlingen, Germany,* Attorney or Agent: William T. Hough, Ex. Gp.: 335

3,923,463, Re. S.N. 784,648, Filed Apr. 4, 1977, Cl. 23/253 R, APPARATUS FOR PERFORMING CHEMICAL AND BIOLOGICAL ANALYSIS, Kenneth Dawson Bagshawe, et al., Owner of Record: *Inventors,* Attorney or Agent: Samuel Scrivener, Jr., et al., Ex. Gp.: 113

3,936,408, Re. S.N. 789,151, Filed Apr. 20, 1977, Cl. 260/29.6 S, WELL CEMENTING COMPOSITION HAVING IMPROVED FLOW PROPERTIES CONTAINING A POLYAMIDO-SULFONIC ADDITIVE, Sally Lee Adams, et al., Owner of Record: *Calgon Corporation, Pittsburgh, Pa.,* Attorney or Agent: Rudolph J. Anderson, Jr., et al., Ex. Gp.: 141

3,964,478, Re. S.N. 786,475, Filed Apr. 11, 1977, Cl. 128/203, INHALER APPARATUS, Georg Kropfhammer, Owner of Record: *Ponta AG, Zurich, Switzerland,* Attorney or Agent: Francis J. Murphy, Ex. Gp.: 335

3,971,289, Re. S.N. 774,862, Filed Mar. 7, 1977, Cl. 85/85, WHEEL NUTS, Joseph W. Chaivre, Owner of Record: *Towne Robinson Fastener Company, Dearborn, Mich.,* Attorney or Agent: Allen M. Krass, et al., Ex. Gp.: 355

4,003,043, Re. S.N. 786,680, Filed Apr. 11, 1977, Cl. 340/403, TIMED BUZZER, Arthur J. Little, et al., Owner of Record: *Stewart-Warner Corporation, Chicago, Ill.,* Attorney or Agent: Augustus G. Douvas, et al., Ex. Gp.: 234

4,011,909, Re. S.N. 789,312, Filed Apr. 20, 1977, Cl. 166/293, METHOD OF USING CEMENTING COMPOSITION HAVING IMPROVED FLOW PROPERTIES, Sally Lee Adams, et al., Owner of Record: *Calgon Corporation, Pittsburgh, Pa.,* Attorney or Agent: Rudolph J. Anderson, Jr., et al., Ex. Gp.: 354

4,012,423, Re. S.N. 787,365, Filed Apr. 14, 1977, Cl. 260/348 R, PROCESS FOR THE PRODUCTION OF EPOXIDES, Arthur M. Brownstein, et al., Owner of Record: *Chem Systems, Inc., New York, N.Y.,* Attorney or Agent: Bert J. Lewen, Ex. Gp.: 121

PATENT EXAMINING CORPS

RENE D. TEGTMEYER, Assistant Commissioner
WILLIAM FELDMAN, Deputy Assistant Commissioner

CONDITION OF PATENT APPLICATIONS AS OF MAY 7, 1977

PATENT EXAMINING GROUPS	Actual Filing Date of Oldest New Case Awaiting Action
CHEMICAL EXAMINING GROUPS	
GENERAL CHEMISTRY AND PETROLEUM CHEMISTRY, GROUP 110—S. N. ZAHARNA, Director. Inorganic Compounds; Inorganic Compositions; Organo-Metal and Organo-Metalloid Chemistry; Metallurgy; Metal Stock; Electro Chemistry; Batteries; Hydrocarbons; Mineral Oil Technology; Lubricating Compositions; Gaseous Compositions; Fuel and Igniting Devices.	8-2-76
GENERAL ORGANIC CHEMISTRY, GROUP 120—A. L. LEAVITT, Director. Heterocyclic, Amides; Alkaloids; Azo; Sulfur; Misc. Esters; Carbohydrates; Herbicides; Poisons; Medicines; Cosmetics; Steroids; Oxo and Oxy; Quinones; Acids; Carboxylic Acid Esters; Acid Anhydrides; Acid Halides.	7-26-76
HIGH POLYMER CHEMISTRY, PLASTICS AND MOLDING, GROUP 140—A. P. KENT, Director. Synthetic Resins; Rubber; Proteins; Macromolecular Carbohydrates; Mixed Synthetic Resin Compositions; Synthetic Resins With Natural Polymers and Resins; Natural Resins; Reclaiming; Pore-Forming; Compositions (Part) e.g.: Coating; Molding; Ink; Adhesive and Abrading Compositions; Molding, Shaping, and Treating Processes.	5-4-76
COATING AND LAMINATING, BLEACHING, DYEING AND PHOTOGRAPHY, GROUP 160—R. FRIEDMAN, Director. Coating; Processes and Misc. Products; Laminating Methods and Apparatus; Stock Materials; Adhesive Bonding; Special Chemical Manufactures; Special Utility Compositions; Bleaching; Dyeing and Photography.	8-27-76
SPECIALIZED CHEMICAL INDUSTRIES AND CHEMICAL ENGINEERING, GROUP 170—H. S. VINCENT, Director. Fertilizers; Foods; Fermentation; Analytical Chemistry; Reactors; Sugar and Starch; Paper Making; Glass Manufacture; Gas; Heating and Illuminating; Cleaning Processes; Liquid Purification; Distillation; Preserving; Liquid, Gas, and Solid Separation; Gas and Liquid Contact Apparatus; Refrigeration; Concentrative Evaporators; Mineral Oils Apparatus; Misc. Physical Processes.	7-12-76
ELECTRICAL EXAMINING GROUPS	
INDUSTRIAL ELECTRONICS, PHYSICS AND RELATED ELEMENTS, GROUP 210—W. L. CARLSON, Director. Generation and Utilization; General Applications; Conversion and Distribution; Heating and Related Art Conductors; Switches; Photography; Motion Pictures; Illumination; Horology; Acoustics; Recorders; Weighing Scales.	11-26-75
SPECIAL LAWS ADMINISTRATION, GROUP 220—C. D. QUARFORTH, Director. Ordnance, Firearms and Ammunition; Radar, Underwater Signalling, Directional Radio, Torpedoes, Seismic Exploring, Radio-Active Batteries; Nuclear Reactors, Powder Metallurgy, Rocket Fuels; Radio-Active Material.	3-15-76
INFORMATION TRANSMISSION, STORAGE AND RETRIEVAL, GROUP 230—J. F. COUCH, Director. Communications; Multiplexing Techniques; Facsimile; Data Processing, Computation and Conversion; Storage Devices and Related Arts.	6-1-76
RECEPTACLES, SANITATION AND CLEANING, WINDING, AND MEASURING, GROUP 240—N. ANSHER, Director. Receptacles; Joint Packing; Conduits; Plumbing Fixtures; Textile Spinning; Food; Agitating; Cleaning; Pressing; Geometrical Instruments; Sound Recording; Winding and Reeling; Measuring and Testing; Indicating.	11-22-76
ELECTRONIC COMPONENT SYSTEMS AND DEVICES, GROUP 250—L. FORMAN, Director. Semi-Conductor and Space Discharge Systems and Devices; Electronic Component Circuits; Wave Transmission Lines and Networks; Optics; Radiant Energy; Measuring.	5-3-76
DESIGNS, GROUP 290—C. D. QUARFORTH, Director. Industrial Arts; Household, Personal and Fine Arts.	10-28-75
MECHANICAL EXAMINING GROUPS	
HANDLING AND TRANSPORTING MEDIA, GROUP 310—D. J. STOCKING, Director. Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Dispensing; Fluid Sprinkling; Fire Extinguishers; Coin Handling; Check Controlled Apparatus; Classifying and Assorting Solids; Boats; Ships; Aeronautics; Motor and Land Vehicles and Appurtenances; Brakes; Railways and Railway Equipment.	5-24-76
MATERIAL SHAPING, ARTICLE MANUFACTURING, TOOLS, GROUP 320—S. S. MATTHEWS, Director. REISSUES

JUNE 14, 1977

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

Re. 29,262

ARRANGEMENT PERTAINING TO A CASE FOR BOTTLES, BOXES OR OTHER STANDARDIZED ARTICLES

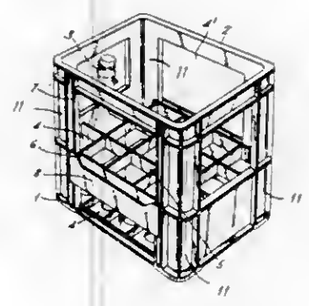
Georg Utz, Bremgarten, Switzerland, assignor to Svein Stromberg & Co. A/S, Lillestrom, Norway

Nov. 9, 1971. Application for reissue Oct. 2, 1975, Ser. No. 618,948

Claims priority, application Switzerland, Nov. 9, 1970, 16612/70

Int. Cl.[2] **B65D** *1/24*; **A47F** *3/14*

U.S. Cl. 220—21 **8 Claims**



1. A case arrangement for the transport and storage of bottles, boxes and other like articles, having a bottom wall, an open top, spaced upstanding corner posts on said bottom wall, side walls extending between adjacent pairs of said posts along all but one side of said bottom wall, a unit located within the case for vertical sliding movement between said posts, said unit including intersecting connected bars forming cells for maintaining the articles stored in the case out of contact with one another, said unit further including a [narrow vertical] *horizontal* bar member secured to one end of said intersecting bars in spaced relationship therewith, said bar member lying outwardly of the remaining side of said bottom wall and slightly overlapping said adjacent pair of said posts at said remaining side thereby forming grooves therewith, inner portions of each of said posts at said remaining side lying within said respective grooves for guiding the vertical movement of said unit, shoulders formed on said portions near said bottom wall, the lower edge of said bar member resting on said shoulders thereby maintaining said intersecting bars spaced from said bottom wall.

Re. 29,263

PROTECTIVE CARTON

Harry I. Roccaforte, Western Springs, Ill., assignor to Hoerner Waldorf Corporation, St. Paul, Minn.

Original No. 3,923,235, dated Dec. 2, 1975, Ser. No. 550,948, Feb. 19, 1975. Application for reissue June 23, 1976, Ser. No. 699,036

Int. Cl.[2] **B65D** *25/14*, *5/58*

U.S. Cl. 229—39 B **7 Claims**

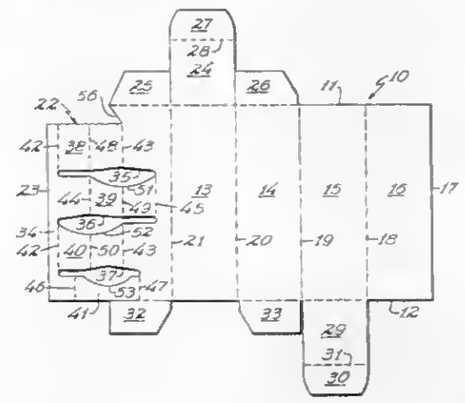
1. In a one-piece carton for shipping and storing fragile articles, said carton made from foldable paperboard or similar sheet-like material and having four side wall panels rectangularly arranged to form an elongated tube and having top and bottom sets of closure flaps for closing the ends of said carton, improved means within said carton for holding said fragile article, said improved means comprising the following:

a cushioning section made from said material and extending between two opposite panels of said four side wall panels, said section extending substantially the length of said carton;

said cushioning section having an upper web member extending between said two opposite panels near one lateral side of said two panels;

said cushioning section also having a middle web member extending generally parallel to said upper web member but positioned below said upper web member and near the opposite lateral side of said two panels;

a lower web member beneath said middle web member and positioned in alignment with said upper web member;



[a tube supporting fourth web positioned below said lower web member and extending between said two opposite panels near the center thereof;]

said members [and said fourth web] connecting in said cushioning section to elongated glue sections connected adjacent to respective opposite lateral edges of said two opposite panels.

Re. 29,264

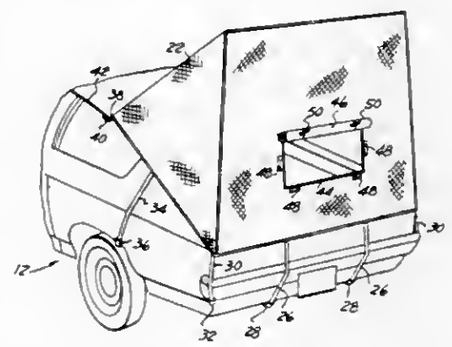
TENT FOR REAR-DOORED VEHICLE

Frederick W. Woodward, Fenton, Mich., assignor to Donald Thornber and Bernice B. Thornber, both of Yale, Mich.

Original No. 3,746,386, dated July 17, 1973, Ser. No. 272,587, July 17, 1972. Application for reissue Feb. 24, 1975, Ser. No. 552,771

Int. Cl.[2] **B60P** *3/34*

U.S. Cl. 296—23 MC **8 Claims**



1. A frameless tent for a passenger type vehicle having a rear door supported in an opening, the vehicle body providing access to the passenger compartment of the vehicle which door is hinged about a horizontal axis at the upper edge of the opening so that when in a closed position its free edges project downward and rearwardly and seal against the edges of the opening and when in an opened position they project upward and rearwardly, said tent comprising: a pair of spaced end

panel portions having a triangle shape formed by first, second and third edges, said second edge forming a base of the triangle and being generally vertically disposed and being substantially longer than the other two edges, said first edge extending downward and forward from the top of said second edge along the edge of the open door, said third edge extending upward and forward from the bottom of said second edge generally along the edge of the door opening, said first and third edges adapted to be connected at the axis of the door and forming an apex of the triangle shape, said second edge of each end panel portion connected together by a first generally vertically disposed quadrangular panel effectively enclosing the space formed within the combined vehicle and tent structure and acting to limit the spacing between the end panels to the width of the vehicle, the first edge of each end panel part connected together by a second generally quadrangular panel and adapted to entirely cover the opened door and to be supported thereby, and fastener means for retaining the third edges of the end panel portions in contact with the vehicle as well as the lower portion of the first quadrangular panel in contact with the vehicle whereby the tent is securely held against the vehicle during movement thereof solely by said fasteners and the door of the vehicle.

Re. 29,265

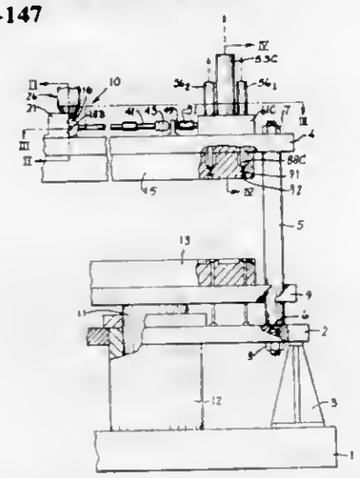
CLOSED CELL FOAM PLASTIC MOLDING MACHINE

James W. Hendry, Holland, Mich., assignor to Ex-Cell-O Corporation, Troy, Mich.

Original No. 3,806,291, dated Apr. 23, 1974, Ser. No. 233,213, Mar. 9, 1972. Application for reissue Mar. 22, 1976, Ser. No. 668,937

Int. Cl.² B29F *1/06*

U.S. Cl. 425—147 **17 Claims**



1. In a plastic foaming and molding device, the combination comprising:

a plasticizing and foaming unit for receiving granular plastic material, said unit including means for causing a gas under pressure to permeate said material, and means for converting the material to plasticized foamed plastic material with said gas entrained therein as bubbles;

a plurality of injection assemblies, each comprising an injection chamber having an injection ram;

plural low pressure passageways providing communication from said plasticizing unit to corresponding ones of said injection assemblies;

power means *operatively connected to and* continuously operating said plasticizing unit for charging a continuous supply of said foamed plastic material into said low pressure passageways at a predetermined, relatively low pressure;

means defining a one-way valve positioned in each said low pressure passageway to permit flow of said foamed plastic material from said unit to the injection chamber of the corresponding injection assembly but preventing reverse flow from said injection chamber toward said unit and other injection assemblies;

plural high pressure passageways *downstream of said low pressure passageways* for conducting said foamed plastic material from each of said injection chambers to a mold cavity and an on-off valve positioned in each said high pressure passageway;

control means *operatively interconnected with said injectian assemblies and* responsive to the appearance of a predetermined amount of plastic material in each of said injection chambers for applying to said injection rams a relatively high pressure in excess of said predetermined pressure and sufficient to close said one-way valve, and for opening said on-off valve to thereby permit said injection ram to drive said foamed plastic material into a mold cavity.

Re. 29,266

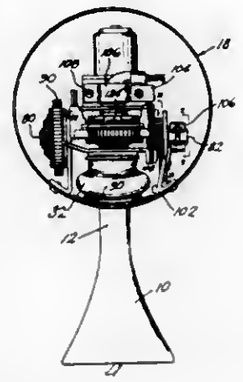
MOTOR CONTROLLED LAMP

Lawrence E. Hessemer; Richard P. Manning, both of Jackson, Mich.; Harry G. Sparks, deceased, late of Jackson, Mich., by Helen W. Sparks, administratrix; and Walter H. Powers, Jackson, Mich., assignors to S-C Liquidating Corporation, Jackson, Mich.

Original No. 3,644,728, dated Feb. 22, 1972, Ser. No. 848,895, Aug. 11, 1969. Application for reissue Jan. 24, 1974, Ser. No. 436,147

Int. Cl.² B60Q *1/06*

U.S. Cl. 240—61.9 **10 Claims**



1. An electric motor-controlled lamp characterized by its compact size, streamlined and unitary appearance and concise relationship of components comprising, in combination, a pedestal support having an *unsupported free* end, an enclosed, hollow lamp housing having an opening defined therein, said pedestal end extending into the interior of said housing through said opening, a first gear connected to said pedestal at said end thereof within said housing having a first axis, a support member rotatably mounted upon said pedestal end adapted to rotate about said first axis, pivot means pivotally supporting said housing upon said support member for oscillation about a second axis perpendicularly disposed to said first axis, a second gear connected to, and within, said housing concentrically disposed about said second axis, first electric motor drive means mounted upon said support member within said housing in operative engagement with said first gear, second electric motor drive means mounted upon said support member within said housing *adjacent said first motor drive means* in operative engagement with said second gear, a lamp mounted upon said housing and control means associated with said electric motor drive means.

PLANT PATENTS

GRANTED JUNE 14, 1977

Illustrations for plant patents are usually in color and therefore it is not practicable to reproduce the drawing.

4,059

CHERRY ROOTSTOCK—COLT VARIETY

Henry M. Tydeman, deceased, late of East Malling, England; by Elizabeth Mary Tydeman, executrix, East Malling, England, and William Marcus Tydeman, executor, Bangor, Wales, assignors to National Seed Development Organisation Limited, Newton, England

Filed Apr. 19, 1976, Ser. No. 678,036

Int. Cl.² A01H *5/03*

U.S. Cl. Plt.—37 **1 Claim**

1. A new and distinct variety of cherry tree useful as a dwarfing cherry rootstock substantially as illustrated and described, produced as a seedling by crossing pollen from *Prunus pseudocerasus* Lind. onto flowers of *Prunus avium* L. F 299/2, which when used as an understock induces less growth of the cherry tree, and higher fruit bud production on the scion in the early life of the grafted cherry tree.

4,060

APPLE TREE—MUTATION OF SCARLET STAYMARED

Roy Tuttle, Greenfield, Ind., assignor to Stark Brothers Nurseries and Orchards Co., Louisiana, Mo.

Filed May 27, 1976, Ser. No. 690,388

Int. Cl.² A01H *5/03*

U.S. Cl. Plt.—34 **1 Claim**

1. A new and distinct variety of apple tree which is a mutation of the Scarlet Staymared variety substantially as shown and described, characterized by the presence of less prominent lenticels and apples of a deeper overall red color having a smoother skin and less tendency to crack.

4,061

PLUM ROOTSTOCK—PIXY VARIETY

A. Beryl Beakbane, East Malling, England, assignor to National Seed Development Organisation Limited, Newton, England

Filed June 15, 1976, Ser. No. 696,307

Int. Cl.² A01H *5/03*

U.S. Cl. Plt.—38 **1 Claim**

1. A new and distinct variety of plum tree useful as a dwarfing rootstock selected from seedlings of *Prunus insititia* St. Julien d'Orleans types substantially as illustrated and described which when used as a plum understock induces less growth of the plum tree, and a higher cropping efficiency on the scion.

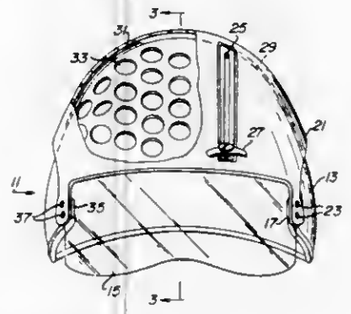
VENTILATED HELMET WITH SELECTED WEIGHT DISTRIBUTION

Richard L. Bell, Philadelphia, and Matthew J. Lamb, Newtown, both of Pa., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed July 2, 1976, Ser. No. 701,940
Int. Cl.² A42B *3/00*
U.S. Cl. 2—6 **15 Claims**

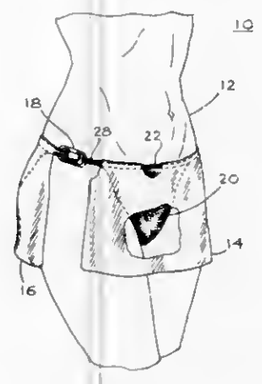


1. A helmet comprising:
a helmet shell having a plurality of holes in the frontal region thereof;
first and second spacing means mounted on either side of the front of said helmet shell, each of said spacing means being provided with at least one aperture for permitting the flow of air therethrough;
a visor guard mounted on said first and second spacing means and covering said plurality of holes; and
a visor located at the front of said helmet and mounted on said first and second spacing means.

4,028,740
CONVERTIBLE BEACH ATTIRE

Adolf Luerken, 26843 Grayslake Road, Palos Verdes, Calif. 90274

Filed Mar. 11, 1976, Ser. No. 666,075
Int. Cl.² A41D *5/00*
U.S. Cl. 2—67 **10 Claims**

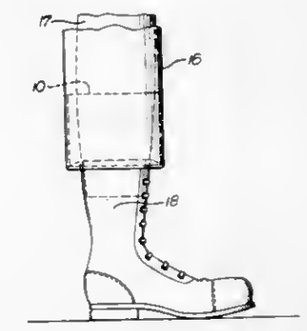


1. Convertible beach attire, which attire comprises, in combination:
a garment adapted to cover the lower portion of the human body;
means for encircling the waist of the human body and supporting the garment in position on the lower portion of the human body;
connector means attached at opposite sides to said encircling means, one connector means at each side of the waist; and
separate first and second flexible panels, each panel having at least two sides and each panel adapted to be releasably connected by its two sides to the connector means selectively at two sides of the waist and at one side of the waist.

4,028,741
PLASTIC BLOUSING BLOCK

William P. Henry, 567-82-9227, Box 80, B Co., 2nd Bn., 6th Inf., A.P.O. New York, N.Y. 09742

Filed May 4, 1976, Ser. No. 682,838
Int. Cl.² A41D *1/06*
U.S. Cl. 2—232 **1 Claim**



1. A military serviceman's pantsleg blousing block comprising:
a split tubular annulus fitting around the leg within a pantsleg just above the top of a boot to gravitate onto said pantsleg to dress the same after the lower end of said pantsleg is tucked into the top of said boot and the latter laced up,
said annulus being integral and invested with a degree of elasticity which spring biases the split ends thereof into engagement when released but permits a gap to be temporarily produced manually between said ends through which the ankle of a leg may be passed in the application of said block to or its removal from said leg,
receptacle means being provided along one of said annulus ends, said means receiving the other of said annulus ends to interlock therewith and closing the split in said annulus,
said receptacle means being provided with flexible wings enclosing a pocket co-extensive therewith,
said other end of said split annulus being provided with a beaded edge adapted to expand said wings and enter said pocket with a snap action thereby locking said annulus ends together until manually sprung apart.

4,028,742
MOTORCYCLE SAFETY BELT

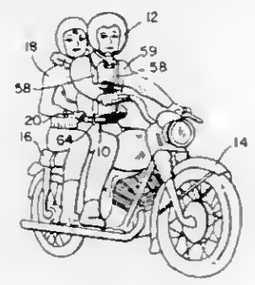
Wilfred Marquis, 132 Baxter St., Pawtucket, R.I. 02861

Filed July 19, 1976, Ser. No. 706,189
Int. Cl.² A41F *19/00*
U.S. Cl. 2—305 **10 Claims**

1. A safety belt adapted to be worn by a driver of a vehicle, said belt comprising:
a. a lower elongated belt band terminating in ends,
b. lower coupling means releasably interconnecting the ends of said lower belt band,
c. an upper elongated belt band terminating in ends,
d. upper coupling means releasably interconnecting the ends of said upper belt band,
e. connecting means joining said lower belt band to said upper belt band in spaced relationship to each other,

f. a pair of shoulder straps extending from said upper belt band,

g. loop means extending from the free end of each of said shoulder straps, said straps adapted to extend over the shoulder of the wearer of the safety belt with said lower belt band extending through said loop means to firmly secure the safety belt around the wearer, and



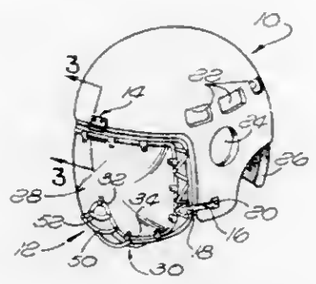
h. handle means to be grasped by a passenger riding in tandem behind the driver wearing the safety belt, said handle means including a pair of spaced apart handles resiliently pivotally connected to said lower belt band such that said handles return to their original position with respect to said lower belt band when said handles are released.

4,028,743

PROTECTIVE HEAD-WEAR

Cai V. Christensen, 8426 Pinelake Drive, Canoga Park, Calif. 91304

Filed Aug. 4, 1975, Ser. No. 601,782
Int. Cl.² A42B *1/08*
U.S. Cl. 2—424 **24 Claims**



1. Protective head-wear comprising:

1. shell means for covering a substantial portion of the head of a wearer and having a peripheral edge adjacent to and extending along the face area of a wearer;

2. face shield means for covering a substantial portion of the face of a wearer and having a peripheral side edge portion; and

3. a soft rubber-like resiliently deformable means defining a slot therein, said peripheral edge of said shell means being received within said slot, said rubber-like means being engaged by said peripheral side edge portion of said face shield means for absorbing a portion of the shock imparted to said face shield means by a blow thereto.

4,028,744

JACKET OF KNITTED JERSEY FABRIC

Pierluigi Rolando, Vicolungo, Italy, assignor to Maglificio Biellese Fratelli Flla S.p.A., Biella, Italy

Filed May 13, 1975, Ser. No. 577,046
Claims priority, application Italy, May 16, 1974, 21180/74[U]
Int. Cl.² A41D *1/02*
U.S. Cl. 2—108 **5 Claims**

1. As a novel article of manufacture, a knitted jersey fabric jacket comprising a rear panel having a shoulder portion, a waist portion, and a pair of inwardly arcuate edge portions extending between said shoulder portion and said waist portion; a pair of side panels each being of one piece and having a waist zone and respectively connected to said edge portions of said rear panel along first seams; a pair of front panels having shoulder regions respectively connected to said shoulder portion of said rear panel along second seams, and lateral edge regions connected to said side panels along third seams so that said rear, side and front panels together constitute a body of said jacket in which said side panels extend between

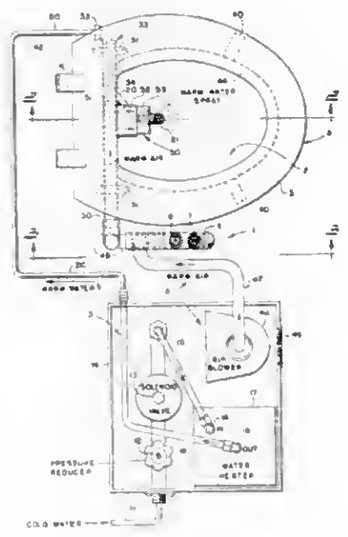
the front and the rear of said body, each of said front panels including a first section having said shoulder region and being of an irregular hexagonal shpae, and a substantially rectangular second section having a waist region and connected to said first section along a fourth seam; and a pair of reinforcing elements of inverted V-shaped configurations respectively connected to said side panels at locations which are spaced from said waist zones and extending toward said rear and front panels, respectively.

4,028,745

SANITARY SPRAY-DRY CLOSET SEAT

Joseph E. Caniglia, 5368 E. 134th St., Garfield Heights, Ohio 44125

Filed May 21, 1976, Ser. No. 688,886
Int. Cl.² A47K *3/22*, *11/08*
U.S. Cl. 4—7 **8 Claims**



1. For a water closet having a generally hollow bowl-like portion and a seat portion above said bowl-like portion, fastened thereto and on which a user may sit, the improvement of a system for washing and drying the body of such a user, comprising:

liquid supply means for supplying warm liquid to said system,

liquid spraying means coupled to said liquid supply means for spraying warm liquid toward the body of such user for washing the same,

air supply means for supplying a flow of air to said system,

air directing means coupled to said air supply means for directing such flow of air toward the body of such user for drying the same,

control means operable by such user for selectively controlling the spraying of such warm liquid and the flow of air respectively from said liquid spraying means and said air directing means,

mounting means for pivotally mounting said liquid spraying means and said air directing means with respect to said water closet proximate the back portion of the bowl-like portion thereof for selective movement by such user between stored and use positions respectively out of alignment and into alignment with the body of such user, said mounting means including an elongated generally tubular member having a longitudinal axis and bracket means for mounting said tubular member between the bowl-like portion and the seat portion for rotation about such longitudinal axis, said tubular member having a hollow portion for coupling a flow of air from said air supply means to said air directing means, and

said liquid spraying means and said air directing means being relatively fixedly supported by said tubular member for rotation therewith, and

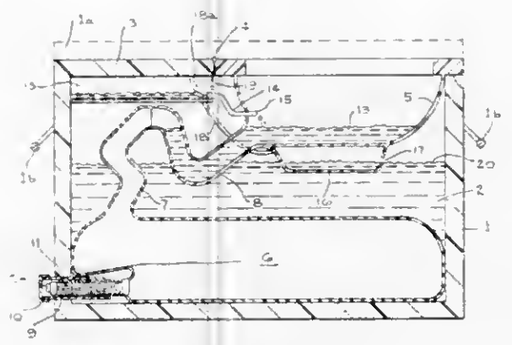
handle means coupled to said tubular member and exposed adjacent the side of the bowl-like portion for access by such user for selectively rotating said tubular member to move said liquid spraying means and said air directing means to such stored and use positions.

4,028,746

PORTABLE TOILET

Gerald N. Huck, 4417 Viking, Houston, Tex. 77018

Filed July 28, 1975, Ser. No. 599,358
Int. Cl.² E03D *5/02*, *5/09*
U.S. Cl. 4—10 **13 Claims**



1. A portable toilet comprising:

housing means, at least a portion of which defines a reservoir for self-contained holding of clean flushing fluid;

a toilet bowl connected to said housing by pivot means from upward pivoting movement from a normal horizontal position, in which flushing fluid and body waste may be retained therein at a predetermined level, to a dumping position, in which said flushing fluid and body waste may be dumped;

a flexible bag container disposed in said reservoir and connected to said toilet bowl for self-contained receiving of said flushing fluid and body waste repeatedly dumped from said toilet bowl upon movement to said dumping position, the outer surfaces of said bag being surrounded and in pressure contact with said clean flushing fluid so that the level of said clean flushing fluid does not fall below its initial level after said repeated dumping of said toilet bowl; and

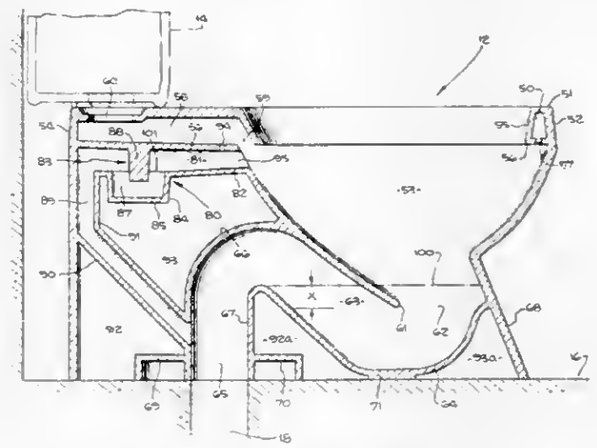
transfer means connected to said toilet bowl and operable, upon its movement to said dumping position and return to said normal position, to transfer flushing fluid from said reservoir to said toilet bowl.

4,028,747

OIL TOILET

Leroy Newton, Marina Del Rey, Calif., assignor to Monogram Industries, Inc., Los Angeles, Calif.

Filed Mar. 26, 1976, Ser. No. 670,990
Int. Cl.² E03D *1/00*, *3/00*, *5/00*
U.S. Cl. 4—10 **11 Claims**



1. In a recirculating toilet system having a bowl emptying into a waste tank having an oil-based flushing fluid of a specific gravity less than water in said tank, flushing fluid recirculating means associated with both said tank and said bowl for selectively removing flushing fluid from said tank and flushing said toilet therewith, the improvement which comprises:

said bowl being of the wash-down type, having a main bowl portion, a flushing manifold encircling at least a portion of the periphery of said bowl portion, a trapway in fluid communication with both the bottom of said bowl portion and a discharge outlet coupled to said waste tank, trap seal means associated with both said bowl portion and said trapway for sealing off odors from said waste tank entering back into said bowl portion, and overflow preventing means integral with said bowl portion in fluid communication with both the upper end of said bowl portion below said flushing manifold and said discharge outlet for removing any waste and oil backing up said bowl portion and returning the same to said discharge outlet, overflow preventing means including an overflow passageway communicating with said discharge outlet, and said trap seal means includes a trap in said passageway for receiving oil therein, and a seal extending transverse of the longitudinal axis of said passageway into said trap spaced above the bottom thereof and below the level of oil therein for providing a seal, said flushing manifold, including a generally horizontally extending passageway in fluid communication with said recirculating means, said first-mentioned passageway including a first portion extending generally parallel to said second-mentioned passageway and inclined downwardly from the horizontal, said first and second passageways being separated by a common wall, said trap being a chamber formed in the bottom wall of said passageway below said common wall, and said seal being an extension portion on said common wall extending down into said chamber.

4,028,748

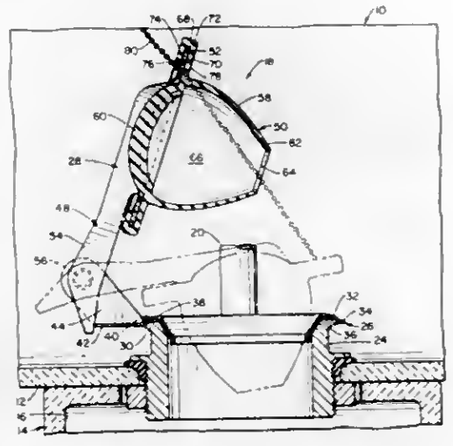
VALVE SEAT OF A FLUSH VALVE USED IN FLUSH TANKS AND THE LIKE

Adolf Schoepe, 1620 N. Raymond Ave., Fullerton, Calif. 92631, and Frederic E. Schmuck, 535 Century Drive, Anaheim, Calif. 92805

Division of Ser. No. 497,524, Aug. 15, 1974, Pat. No. 3,988,785. This application Oct. 23, 1975, Ser. No. 625,194

Int. Cl.² E03D *1/14, 1/34, 3/12*

U.S. Cl. 4—52 **5 Claims**



1. In a flush valve for tanks and the like, the flush tanks being of the type having a flush valve seat portion opening downwardly therethrough with a generally upwardly facing annular end; the combination of: an annular valve seat on the upwardly facing annular end of the flush valve seat portion comprising two radially adjacent generally upwardly facing concentric ring portions each circumscribing said valve seat, each of said ring portions having a generally upwardly projecting and facing sealing surface; a closure member movable downwardly to and upwardly away from said valve seat and having an annular resilient sealing surface overlying and abuttingly sealing against said valve seat in a downwardly closed position; one of said valve seat ring portions projecting upwardly toward said closure member sealing surface a greater distance than the other of said valve seat ring portions when said closure member is in said downward overlying closed position, said closure member sealing surface primarily abuttingly sealing downwardly against said one valve seat ring portion in said closure member downward overlying sealed position during initial use of said closure member, said one valve seat ring portion ultimately permanently resiliently upwardly compressing said closure member sealing surface after continued use of said closure member sufficient to permit abutting sealing against both said valve seat ring portions by said closure member sealing surface in said closure member downward overlying sealed position.

4,028,749

SANITARY CHAIRS

David Richard James, Gloucester, England

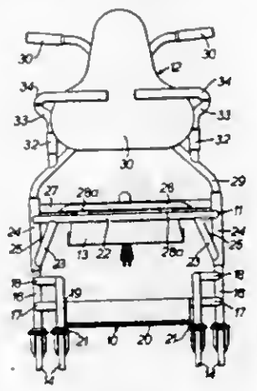
Filed Jan. 13, 1976, Ser. No. 648,774

Claims priority, application United Kingdom, Jan. 21, 1975, 2539/75

Int. Cl.² A47K *11/02, 11/04;* **A61G** *7/02*

U.S. Cl. 4—134 **9 Claims**

1. A mobile sanitary chair having a tubular metal frame comprising a base frame portion and a seat frame portion, said base frame portion having two upstanding seat support members respectively disposed adjacent rear corners of the chair, ground-support wheels mounted below the base frame portion, an apertured toilet seat supported by said seat frame portion, said seat frame portion having two support members respectively engaging said seat support members of the base frame portion to provide two telescopic supports which allow height adjustment of the seat with the seat frame portion supported by the base frame portion in a forwardly cantilevered manner, and separate locking means respectively associated with the two telescopic supports to retain a preset



height adjustment, the frame being open at the rear below the seat and the frame tapering in plan view from front to rear whereby to enable a plurality of similar chairs to be stacked in line nesting one within the other.

COVER FOR WATER-FILLED OUTDOOR SWIMMING POOLS

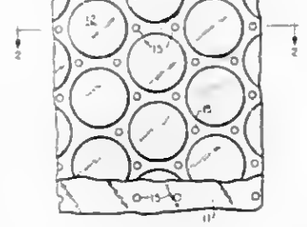
Erik G. Gustafsson, Stocksund, Sweden, assignor to Barracudaverken Aktiebolag, Sweden

Filed Dec. 2, 1975, Ser. No. 636,828

Claims priority, application Sweden, Dec. 5, 1974, 7415255

Int. Cl.² E04H *3/16, 3/18;* **F16L** *22/02*

U.S. Cl. 4—172.12 **10 Claims**



1. A protective cover, for water-filled outdoor swimming pools, comprising

a flexible sheet of size and shape to cover the surface of the water in the pool, said sheet comprising

at least two thin, flexible polymeric films,

a first one of said films having a plurality of laterally spaced pockets which depend from the film when the sheet is in place on the water in the swimming pool,

another of said films overlying said first film so as to extend across said pockets and the portions of said first film which are not occupied by said pockets,

said other film being secured to said portions of said first film to unite said first film and said other film and to seal against entry of water into said pockets,

said pockets, thus sealed, constituting hollow buoyancy cells spaced apart and distributed over the sheet to provide the sheet with an overall positive buoyancy adequate for support of the sheet on the surface of the swimming pool water with the portions of said first film which are not occupied by said pockets then being supported at a level spaced slightly above the surface to the swimming pool water,

there being a plurality of drain apertures spaced apart and distributed over the sheet in areas thereof not occupied by said buoyancy cells, for passage of rain water downwardly through the sheet.

4,028,751

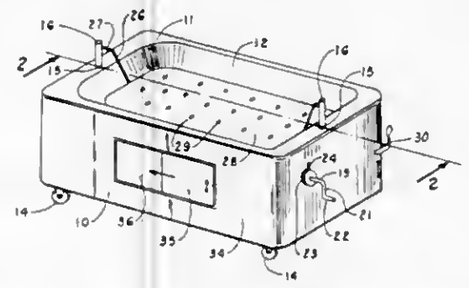
INTENSIVE CARE PORTABLE BATHTUB

Barber Moran, New Orleans, La., assignor to The Raymond Lee Organization, Inc., New York, N.Y., a part interest

Filed June 30, 1975, Ser. No. 591,470

Int. Cl.² A47K *3/12*

U.S. Cl. 4—173 R **5 Claims**



1. An intensive care portable bathtub, comprising

a housing having a top, a bottom and sides;

roller means rotatably affixed to the bottom of the housing;

a sunken bathtub mounted in the housing and extending from the top thereof;

a pair of openings in the tip of the housing at opposite ends thereof;

a pair of shafts each positioned substantially vertically in and extending through corresponding one of the openings;

a pair of guide means for the shafts in the housing;

a support rod affixed at its ends to the upper ends of the shafts outside the housing, said support rod being bent and extending within the bathtub;

a perforated duckboard on the support rod in the bathtub; and

control means in the housing coupled to the shafts and extending from the housing for selectively raising and lowering the shafts to selectively raise and lower the duckboard via the support rod, wherein said control means further comprises a pair of substantially linear gears each affixed to a corresponding one of the shafts in the housing, a third longitudinally extending shaft having opposite ends journalled in opposite sides of the housing, one end of the third shaft extending out of the housing, a pair of longitudinally spaced gears affixed to the third shaft in the areas of the opposite ends thereof, said gears being rotatable with said third shaft, each of said gears being drivably coupled to a corresponding one of the substantially linear gears, and crank handle means affixed to the end of the third shaft outside the housing.

4,028,752

LOAD-CARRYING APPARATUS

Hermann Oerthel, Bavariaring 35, D-8000 Munich, Germany

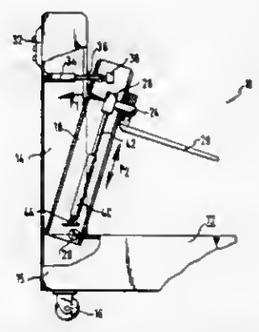
Filed Sept. 11, 1975, Ser. No. 612,586

Claims priority, application Germany, Sept. 25, 1974, 2445764

Int. Cl.² A61G *7/10, 1/02*

U.S. Cl. 5—81 R **8 Claims**

1. A load carrying apparatus, particularly for non-ambulatory patients, comprising a support; an elongated load-carrying shelf; a normally upright elongated supporting member having a longitudinal slit extending along a side thereof and also having a lower end region mounted on said support for pivoting about a substantially horizontal axis which extends lengthwise of said shelf, said shelf being mounted on said supporting member upwardly of said lower end region; means for tilting said supporting member about said axis between vertical and inclined positions so as to impart to said shelf a composite movement having one component in generally vertical direction and another component in generally horizontal direction, whereby to facilitate transfer of a load onto and off said shelf; and moving means for raising and lowering said shelf and having one end connected to said sheld and



provided with a projecting which extends through said slit in a direction transversely of the elongation of said sheld, said moving means having another end pivotally connected to said lower end region of said shelf.

4,028,753

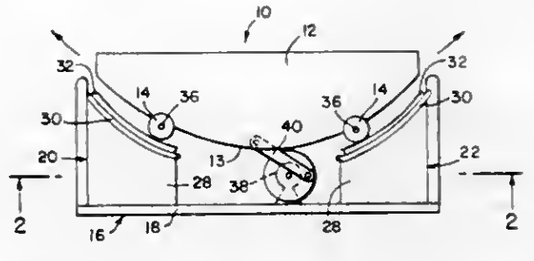
AUTOMATICALLY ROCKABLE INFANT'S CRIB

Augusto Rios, 1815 Grand Concourse, Bronx, N.Y. 10453

Filed Oct. 16, 1975, Ser. No. 623,256

Int. Cl.² A47D *09/02*

U.S. Cl. 5—108 **4 Claims**



1. An automatically rockable crib for infants comprising in combination:

a crib;

a crib support assembly rockably supporting said crib and including a base and a platform stand carried by said base at each corner thereof, each said platform stand being provided with an upwardly facing transversely extending arcuate surface, said crib including a contoured bottom portion at least in the regions overlying said arcuate surfaces, the contour of said contoured bottom portions being complementary to the contours of the underlying arcuate surfaces of said platform stands.

4,028,754

ADJUSTABLE HEAD AND SHOULDER REST

George Daniel Eary, Sr., 8 N. Woodlawn Ave., La Vale, Md. 21502

Continuation-in-part of Ser. No. 559,009, March 17, 1975. This application Dec. 19, 1975, Ser. No. 642,537

Int. Cl.² A47C *21/00*

U.S. Cl. 5—327 B **4 Claims**

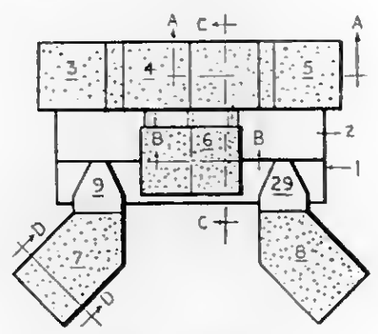
1. An adjustable rest for the head and shoulder portion of the human body comprising:

a. a base member consisting of two inseparable portions that are movable longitudinally and latitudinally in a limited manner relative to each other and rotatable about a vertical axis in a limited manner,

b. a pair of laterally spaced apart resilient shoulder support members, adjustably attached to said base member and adapted to support the shoulders of said human body in a predetermined position,

c. each of said shoulder members being so attached to allow limited rotational movement around a vertical axis,

d. a face support member, rotatable in a limited manner about a horizontal axis, having separate interconnected movable members comprising at least, one for the forehead, configured as a modified "W" and, at least, one for the lower face configured as an inverted, shallow "V", so aligned to provide support for the human head at varying degrees between the vertical and horizontal positions, to the right or left side, providing two surfaces, with one always in reserve,



e. said lower face support member adjustably attached providing means to vary distance between said lower face member and forehead member,

f. means of adjustably raising the rotatable face support member, aided by the upward pressure of one or more properly positioned springs, to a heighth suitable for support of the human head while the user is lying on his or her right or left side,

g. means for varying tension strength of each spring.

4,028,755

METHOD OF REMOVING WAX MOTH LARVAE FROM INFESTED ENCLOSURES

Hayward Gosse Spangler; Norbert Mariner Kauffeld, both of Tucson, Ariz., and Charles Dean Owens, East Falmouth, Mass., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.

Filed Apr. 30, 1976, Ser. No. 682,069

Int. Cl.² A01K *51/00*

U.S. Cl. 6—1 **4 Claims**

1. A method of removing wax moth larvae from enclosures containing the same, which comprises:

a. tapping the enclosure with a hard object at a frequency of about from 1 to 10 taps per second and with a force sufficient to cause the larvae to move to the surface of the enclosure, and

b. removing the larvae from the surface.

4,028,756

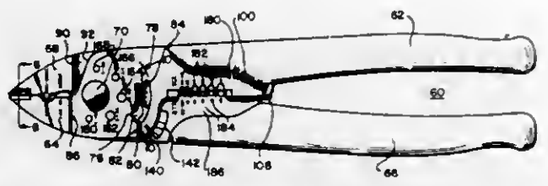
HAND TOOL FOR WORKING ON ELECTRICAL CONDUCTORS

Luis R. Couto, Elizabeth, N.J., assignor to Thomas & Betts Corporation, Elizabeth, N.J.

Filed Apr. 9, 1975, Ser. No. 566,192

Int. Cl.² B25B *7/22*

U.S. Cl. 7—5.5 **12 Claims**



1. A hand tool comprising: a first handle member; a second handle member; pivot means coupling said second handle member to said first handle member to permit selective movement of said first and second handles towards and away from each other in arcs about said pivot means; first jaw means coupled to said first handle means; first crimping means on said first jaw means; indicator means on said first jaw means; second jaw means coupled to said second handle means; second crimping means on said second jaws means and indicia on said second jaw means arranged to be positioned adjacent said indicator means in said first jaw means; said indicia indicating the proper positions for said first and second jaw members to crimp a selected terminal to an appropiately sized conductor placed in said first and second crimping means; the positioning of said indicator means adjacent said indicia permitting a visual determination of a proper crimp of a selected terminal to an appropriately sixed conductor.

4,028,757

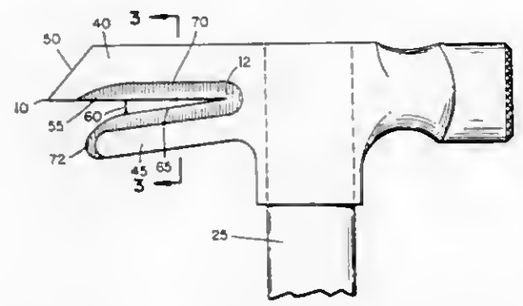
RAKER CLAW HAMMER

Clifford Kenneth Young, P.O. Box 787, Kings Beach, Calif. 95719

Filed May 19, 1975, Ser. No. 578,506

Int. Cl.² B25F *1/00*

U.S. Cl. 7—8.1 R **1 Claim**



1. An improved claw hammer, comprising a hammerhead, a handle mounted in and normal to said hammerhead, and a pair of claws (claw) provided on said hammerhead, comprising at least two blades having their respective planes parallel to the axis of said handle and defining a V-shaped groove therebetween, one of which claws is pointed and one of which claws is rounded, said pointed claw being longer than said rounded claw (and its claw engages the shank of a nail embedded in wood, the nail will be lifted from the wood by inertia rather than leverage) so that when such hammer is swung laterally so that the shank of a nail comes between each of the claws, such that the rounded portion of one of said claws allows the nail to be driven between said claws, the entire nail will be lifted from the wood by inertia rather than leverage.

4,028,758

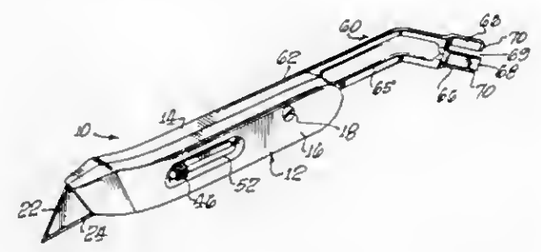
COMBINATION UTILITY KNIFE AND STAPLE REMOVER

John J. O'Connor, 26412 Vla del Sol, Mission Viejo, Calif. 92675

Filed Sept. 22, 1975, Ser. No. 615,346

Int. Cl.² B25F *1/04;* **B26B** *11/00*

U.S. Cl. 7—14.1 R **1 Claim**



1. In combination, a utility knife and staple remover

wherein the knife portion includes a cutting blade therein, said combination comprising:

a split housing having removable top and bottom sections, said sections forming a compartment therebetween, said top section having a longitudinal slot disposed therein;

means for removably securing said top and bottom sections together;

a blade-support bracket having a base member integrally formed therewith and including extending tab members, said bracket being formed of a flexible material and including a plug arranged to be received in said slot of the top section; and wherein said bracket is slidably disposed for longitudinal movement within said compartment, and a spring mounting pin affixed rearwardly thereof;

biasing means attached to said blade-support bracket to automatically retract said blade attached to said bracket, wherein said biasing means comprises a coiled spring having one end connected to said support bracket and the opposite end thereof connected to said housing, and wherein said mounting pin is mounted to said bracket having the coiled portion of said spring affixed thereto;

locking means arranged between said support bracket and one of said sections, whereby said blade is locked into a predetermined position wherein said locking means comprises:

a plurality of notches arranged in the upper section of said housing, at least one of said notches being a forward notch and one being a rearward notch; and

a pair of ears integrally formed in said support bracket arranged to be received in said notches;

staple-removing means secured to one of said sections, said means including pivoting means whereby said staple-removing means is rotated thereon in a side-to-side movement when removing a fixed staple, wherein said staple-remover means comprises:

an elongated, substantially-flat, metal bar secured to said bottom section of said housing, said bar being bent at an obtuse angle relative to said housing;

three forked tongues formed in one end of said bar, the central tongue being offset outwardly from the remaining side tongues, said side tongues having wedge-shaped ends formed thereon, wherein said pivoting means comprises a convex/concave body portion formed longitudinally in said bar, whereby said staple-remover is pivoted from side-to-side when removing staples, and wherein said top and bottom sections of said housing include longitudinal channels therein forming guides, whereby said extended tabs of said support bracket are slidably disposed in respective guides and wherein a track is arranged between said sections to slidably receive said cutting blade therein.

4,028,759

MARINE ANCHOR BUOYS

Earl Lee Toups, Mobile, Ala., assignor to Lee Marine, Inc., Kaplan, La.

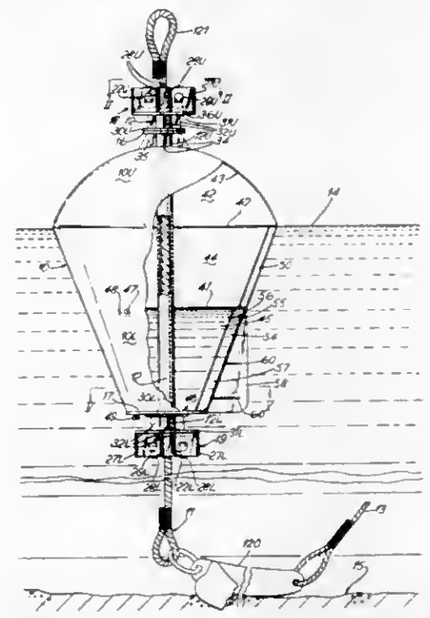
Filed Apr. 26, 1976, Ser. No. 680,505

Claims priority, application United Kingdom, June 25, 1975, 26889/75

Int. Cl.² B63B *21/52*

U.S. Cl. 9—8 R **6 Claims**

1. A buoy for supporting a varying length of cable connectable with an anchor, comprising a buoyancy chamber for containing a flotation medium to float the buoy, means for replacing at least a portion of said buoyancy medium with a heavier medium thereby permitting the buoy to float at a predetermined desired height above the surface of a body of water regardless of the length of cable being supported, the varying length of the cable being supported by the buoy being dependent upon the predetermined height, cable guiding means mounted on said buoyancy chamber for permitting movement of said cable relative to said buoyancy chamber and at least one roller assembly mounted on said cable guiding means, said roller assembly mounted on said cable guiding means, said roller assembly including a plurality of freely



rotatable rollers defining an opening for passage of the cable therethrough in a substantially friction free manner.

4,028,760

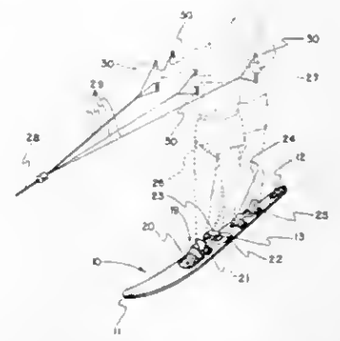
DOUBLE SLALOM SKI

Russell W. Tarlton, Jr., 1109 Athens Drive, Raleigh, N.C. 27606

Filed Aug. 25, 1975, Ser. No. 607,471

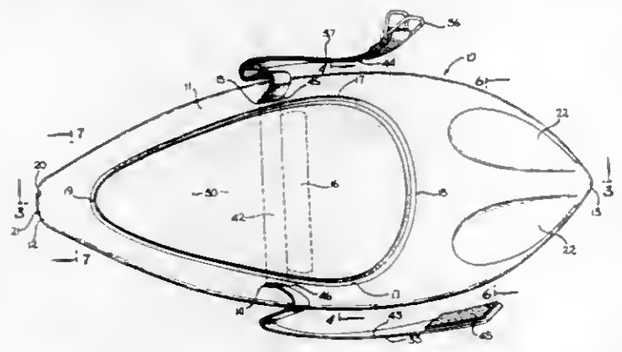
Int. Cl.² A63C *5/00*

U.S. Cl. 9—310 A **9 Claims**



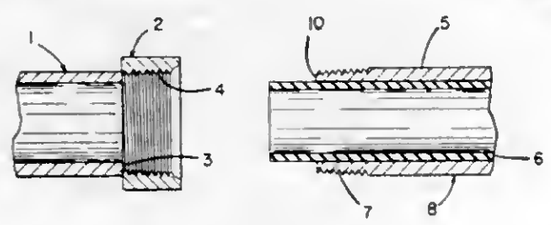
1. A ski device comprising: a slalom type water ski body having a slightly upturned front portion and a relatively flat rear portion; at least four foot retaining means secured to the upper portion of said ski, two of said retaining means being laterally aligned and touching each other with at least one retaining means disposed longitudinally forward thereof and at least one retaining means being disposed longitudinally rearwardly thereof; and means on the bottom portion of said ski to provide lateral directional stability to said ski when in use whereby a slalom type water ski for at least two persons is provided.

4,028,761
MULTIPURPOSE SLIDE
John Taylor, Long Beach, Calif., assignor to Born Free Plastics, Inc., Gardena, Calif.
Continuation of Ser. No. 453,709, March 28, 1974, abandoned. This application Oct. 9, 1975, Ser. No. 621,235
Int. Cl.² A63C 5/02, 15/12
U.S. Cl. 9—310 B 13 Claims



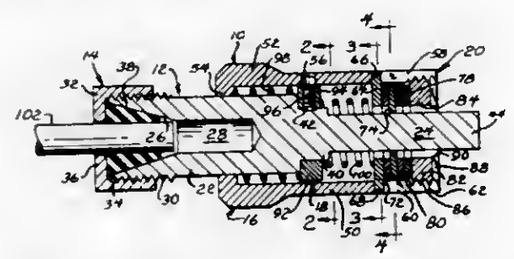
1. A slide for supporting a human passenger during water and snow sports activity, comprising:
an elongated body having a front and rear end, said body being of seamless construction and having spaced apart top and bottom walls which join around the rounded edges of said body, the top wall of said body having a knee well formed therein for accommodating said passenger and an opening at each side of said knee well, said bottom wall having a convex compound curve shape;
a knee strap passing through said openings and under said top wall therebetween; and
plastic foam substantially filling said body.

4,028,762
METHOD OF THREADING SHORT SPOOL PIECES
Dale Allen Jueckstock, Sanford, and Thomas Wayne Hindman, Sr., Gladwin, both of Mich., assignors to Robert L. McKellar, Midland, Mich., a part interest
Filed Feb. 25, 1976, Ser. No. 661,293
Int. Cl.² B23G 1/02, 1/52
U.S. Cl. 10—1 B 5 Claims



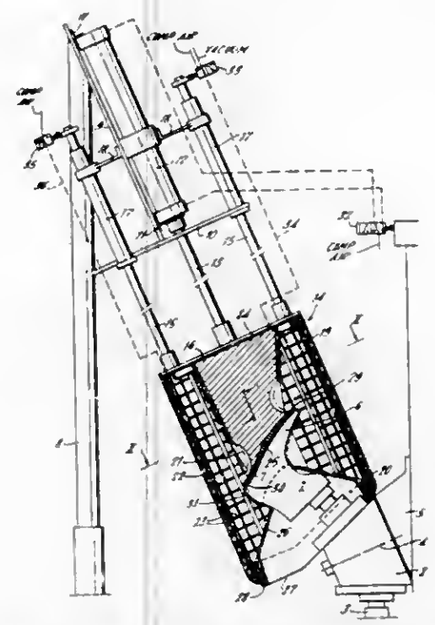
1. An improved method of threading short spool pieces of lined pipe which method consists of
inserting one end of a segment of lined pipe in a conventional threading machine,
cutting a predetermined section from the other end of the pipe while leaving the lining intact,
threading the pipe segment on the end which contains the exposed lining,
cutting the pipe to the desired length including the threaded and exposed lining,
reversing the threaded pipe in the threading machine so that a second end is in contact with the threading dies,
cutting a second predetermined section of the pipe while leaving the lining intact,
threading the pipe segment on the second end whereby a short spool piece is produced,
wherein the improvement comprises centering and maintaining the short spool piece in the conventional threading machine by mounting said short spool piece in a device which protects the exposed lining during the cutting and threading of the second end of said short spool piece,
said device consisting of a hollow stabilizer and guide bar having a length of 9 inches or greater, an outside diameter of from 1⅜ to 6⅝ inches and an inside diameter of from one-eigth to one-fourth inches smaller than the outside diameter,
a workholder which is circular in structure and which has an outside diameter greater than the outside diameter of the stabilizer and guide bar and which has a standard threaded inside diameter of one-eighth to one-fourth inch greater than the inside diameter of the stabilizer and guide bar, said workholder having a length which is dependent on the diameter of the short spool piece being processed, which in turn is dependent upon the length of exposed lining that is desired in the short spool piece, said workholder being axially aligned and permanently affixed to one end of the hollow stabilizer and guide bar.

4,028,763
TAP HOLDER
Al Jenner, 222 Grand Canyon Parkway, Hoffman Estates, Ill. 60172
Filed Sept. 20, 1974, Ser. No. 507,730
Int. Cl.² B23G 1/16, 5/16
U.S. Cl. 10—135 R 1 Claim



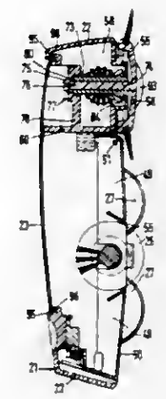
1. A tap holder particularly adapted for use on a numerical-controlled machine comprising, an elongated tap holder shaft, a tap holder collet on one end of said shaft for releasably holding a tap, the elongated tap holder shaft has an integral non-circular cross-section drive tail on the end of the shaft opposite to the end having the tap holder collet; a tap holder body rotatably mounted on the tap holder shaft and being adapted for releasable driving connection to a tool holder of a numerical-controlled machine, said tap holder body including a pair of opposed slots at one end of an internal thread at said end, a drive rate compensating assembly connecting the tap holder body and the tap holder shaft and allowing relative axial movement therebetween, said drive rate compensating assembly including a spring collar releasably mounted on said shaft, a set screw holding the spring collar on said shaft, a first coil spring having one end connected to the spring collar and the other end connected to the tap holder body, and a second coil spring having one end connected to the spring collar and the other end connected to the tap holder body, said first and second coil springs having substantially equal spring rates, whereby the springs allow axial displacement of the shaft relative to the body; and said tap holder body has a screw aperture contained therein, alignable with the set screw to provide a means of access for manipulating the set screw, and a limited drive torque assembly drivingly connecting the tap holder shaft to the tap holder body for turning the tap holder shaft at a torque under a selected maximum amount, said limited drive torque assembly includes a substantially flat body drive plate having a pair of ears extending into the slots of the body for driving rotation with the body, a substantially flat shaft drive plate having an aperture mateably receiving the drive tail of the tap holder shaft and being axially movable along the drive tail, a substantially flat brass washer positioned between the shaft drive plate and the body drive plate and frictionally engaging said shaft drive plate and the body drive plate to provide a frictional driving connection between the shaft drive plate and the body drive plate, a second brass washer frictionally engaging the body drive plate, a steel washer frictionally engaging the second brass washer, and an end cap threadedly mounted in the tube and engaging the steel washer to determine the normal force between the first brass washer and the body drive plate and the shaft drive plate to determine the maximum torque transmitted between the tap holder body and the tap holder shaft; and said drive rate compensating assembly including a spring collar releasably mounted on the tap holder shaft, a first coil spring having one end engaging the spring collar and the other end engaging the body, and a second coil spring opposed to the first spring, said second coil spring having one end engaging the spring collar and the other end engaging the body drive plate, said springs having equal spring rates, whereby the springs allow axial displacement of the tap holder shaft relative to the tap holder body.

4,028,764
APPARATUS FOR LASTING FOOTWEAR UPPERS
Gerard J. M. Wilms, Son, and Hendrik C. J. Joosten, Eindhoven, both of Netherlands, assignors to Bata Shoe Company, Inc., Belcamp, Md.
Filed Jan. 22, 1976, Ser. No. 651,437
Claims priority, application United Kingdom, Jan. 22, 1975, 2859/75
Int. Cl.² A43D 00/00
U.S. Cl. 12—1 W 7 Claims



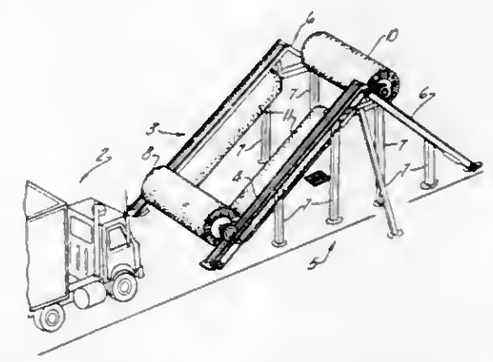
1. Apparatus for shaping and lasting footwear uppers, comprising a chamber formed by a tubular flexible diaphragm and an end plate at one end thereof, a last mounted on a last support, the last support being adapted to sealingly engage the other end of said tubular diaphragm to close the chamber with the last inside, means for connecting the interior of said chamber to a vacuum source, and a pleat guide mounted within the chamber on the end plate.

4,028,765
FLOOR OR CARPET SWEEPER
Johannes Liebscher, Nassau, Lahn, Germany, assignor to Leifheit International Gunter Leifheit GmbH, Nassau, Lahn, Germany
Filed July 19, 1976, Ser. No. 706,564
Claims priority, application Germany, July 24, 1975, 2533071
Int. Cl.² A47L 11/32
U.S. Cl. 15—42 13 Claims



1. A carpet or floor sweeper comprising: a housing displaceable forwardly and oppositely backwardly in a normal direction of travel and having an open bottom; a plurality of floor-engaging wheels rotatable on said housing; a cover plate closing said bottom of said housing and formed with a central hole and forming to at least one side of said hole a dust-catching receptacle; means pivoting said plate on said housing about an axis extending transverse to said direction; a rotatable brush elongated transverse to said direction extending through said hole; means mounting the elongated brush on said cover plate for rotation of said elongated brush about its longitudinal axis; and means operatively connecting said brush to said wheels for rotation of said brush by said wheels.

4,028,766
DOUBLE OVERHEAD BRUSH ASSEMBLY
David J. Bivens, Danville, Va., assignor to Bivens Winchester Corporation, Danville, Va.
Filed Mar. 11, 1976, Ser. No. 666,123
Int. Cl.² B60S 13/06
U.S. Cl. 15—53 AB 11 Claims



1. A machine for washing the exterior of vehicles comprising, in combination, frame means adapted for relative movement between the frame means and a vehicle in the direction of the length of the vehicle, the frame means comprising first guide means inclined upwardly in the direction of the said relative movement and comprising second guide means inclined downwardly in the direction of the said relative movement; first and second rotary brushes each mounted for rotation about a substantially horizontal axis substantially normal

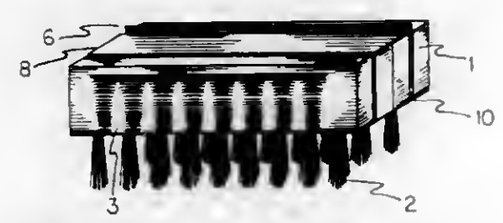
to the said relative direction, the first and second rotary brushes being guided for translation along the first and second guide means, respectively; the first brush being adapted to engage the end of the vehicle which is forward and the second brush the end which is rearward in the direction of said relative movement, and both brushes being adapted to engage the upper surface of the vehicle, the brushes being individually controlled in such translation by engagement with the respective ends of the vehicle; power means for rotating the said brushes about their respective axes, the first brush being rotated in such sense as to be biased upwardly by engagement with the said forward end of the vehicle; first power traverse means coupled to the first brush operable to translate the brush upwardly along its guide means, the said power traverse means being operable to raise the brush from the vehicle; means effective to lower the brush along its guide means after passage of the vehicle; second power traverse means coupled to the second operable to translate the brush upwardly along its guide means and to hold the brush in an elevated position; means responsive to entry of the vehicle into the machine effective to lower the second brush against the top of the vehicle and to free the brush to translate downwardly in contact with the said rearward end of the vehicle; means effective upon completion of the downward translation of the second brush to actuate the second power traverse means to return the second brush to its elevated position and retain it there until freed by entry of a subsequent vehicle into the machine.

4,028,767

FOLDABLE BRUSHES

Ren Judkins, P.O. Box 8342, Salt Lake City, Utah 84108

Filed Oct. 29, 1975, Ser. No. 620,126
Int. Cl.² A46B *7/02, 15/00*
U.S. Cl. 15—203 **6 Claims**



1. A collapsible brush comprised of a plurality of rectangular segments in which the thickness of the edges is smaller than the width and also the length of the faces; means to articulate said segments such that said segments can be fan folded (accordian) face to face in a stack and unfolded edge to edge; bristle tufts mounted in at least one adjacent edge of each segment, said bristle tufts staggered with respect to the bristle tufts extending from the edge of the adjacent segment; a plurality of hollow depressions formed in at least one face of each segment, the depressions being adapted to receive the bristle tufts of an adjacent segment when the brush is unfolded.

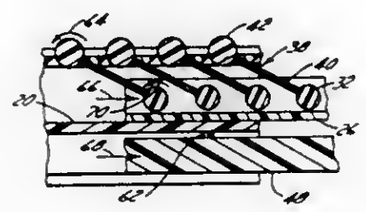
4,028,768

RETRACTABLE BRUSH

Brian W. Pascal, 182 Northcoat Drive, Pincourt, Quebec, Canada

Filed Jan. 14, 1976, Ser. No. 649,160
Claims priority, application Canada, Nov. 6, 1975, 239268
Int. Cl.² A46B *9/10, 17/06*
U.S. Cl. 15—203 **13 Claims**

1. A self-cleaning retractable brush structure comprising a body portion, a movable bristle bed within said body portion, a plurality of bristle members secured to said bristle bed, rotatably mounted guide members, said guide members having a plurality of apertures therein, each of said apertures being sized to snugly receive at least one bristle member, and means for moving said bristle bed from a first position wherein said bristle members are in an erect condition, to a second position wherein said bristle members are in a retracted condition with the free end of each bristle member being within its



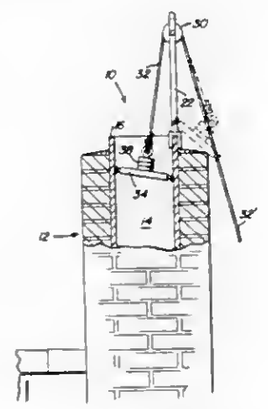
aperture, such that said bristle members are drawn through said apertures while said guide members rotate whereby an extraneous material is removed from the bristle members and remains on a surface of said guide members.

4,028,769

APPARATUS FOR CLEANING CHIMNEY FLUES

Louis M. Coviello, and Claire V. Coviello, both of R.R. No. 1, Cook, Minn. 55723

Filed Feb. 26, 1976, Ser. No. 661,803
Int. Cl.² F23J *3/00*
U.S. Cl. 15—249 **8 Claims**



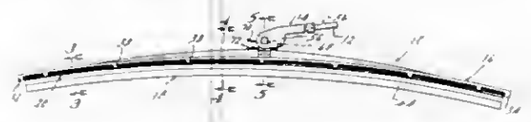
1. A chimney cleaning apparatus comprising: sweep means for movement up and down within the inside of the chimney for cleaning same, said sweep means including a flexible member shaped to provide a plurality of outer edges and being slightly larger than the inside of circumference of said chimney which will permit the outer edges of said flexible member to flex in an up and down direction while the sweep means is in operation, at least two or the outer edges of said flexible member being provided with rectangular strips fastened thereto, a removable platform mount for the top of the chimney, a flexible line connected to the sweep means and associated with the mount for operation by an operator on the base level outside of said chimney, additional means provided on the removable platform mount for enabling the operator to quickly and easily store the sweep means on the removable mount when the sweep means is not in use, the additional means on the removable platform mount for enabling the operator to store the cleaning sweep means consists of an inverted angle iron structure mounted on the top of the platform mount with the point upwardly to present a sharp pointed upwardly directed edge for catching and retaining the flexible member of the sweep means for storage purposes.

4,028,770

WINDSHIELD WIPER ASSEMBLY

Walter D. Appel, 4350 Commerce Road, Orchard Lake, Mich. 48033

Filed Sept. 15, 1975, Ser. No. 613,075
Int. Cl.² B60S *1/38*
U.S. Cl. 15—250.42 **1 Claim**



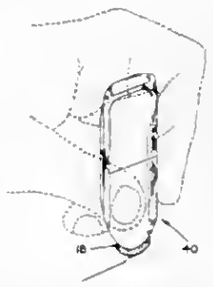
1. A windshield wiper blade assembly comprising,
an elongated flexible arcuate-shaped one-piece superstructure fabricated of a molded plastic material,
said superstructure having a uniform radius of curvature,
connector means located adjacent a central portion of said superstructure for securing the same to an associated wiper arm,
said superstructure having a first retaining means formed intergrally thereon and spaced longitudinally therealong the entire length thereof,
said first retaining means comprising a plurality of downwardly projecting fingers formed integrally of said superstructure and defining a longitudinally extending recess, said fingers being spaced along said superstructure and each having an inwardly projecting distal end portion,
a wiper blade including a resilient windshield engaging wiping lip portion and an upwardly extending mounting portion,
an elongated flexible retaining member fabricated of a molded plastic material secured to and coextensive of said blade,
said retaining member having a first portion insertable into said recess and a pair of laterally opposed longitudinal slots adapted to receive said distal ends of said fingers for securing said retaining member to said superstructure, and a second portion defining a longitudinally extending slot formed along the undeside of said member and adapted to receive said upwardly projecting mounting portion of said blade, whereby said blade assumes said arcuate shape of said superstructure and is thereby adapted to exert a uniform wiping pressure against said windshield,
means for limiting longitudinal sliding movement of said retaining member and said blade relative to said superstructure,
said means for limiting relative movement of said retaining member comprising a pair of integral end stops projecting downwardly from the longitudinally opposite ends of said superstructure and adapted for engagement with the longitudinally opposite ends of the assemblage of said retaining member and blade for limiting longitudinal sliding movement thereof, and means for providing torsional stiffness at the opposite ends of said superstructure and comprising a pair of generally uniform rectangular crosssectional shaped end protions on said superstructure so as to maintain the opposite ends of said blade in wiping engagement with the associated windshield during oscillatory movement of said assembly, each of said end protions extending inwardly to a location approximately one third of the distance beytween said end stops and the central portion of said superstructure, said one peice superstructure being formed with an integral upwardly projecting reinforcing rib having a maximum thickness at said central portions of said superstructure and gradually tapering to a minimum thickness at said inward locations of said end protions.

4,028,771

THIN FLAT ERASER AND HOLDER

Jau-Guang Lin, 103 Elmere Rd., Owings Mills, Md. 21117

Filed Mar. 15, 1976, Ser. No. 666,972
Int. Cl.² B43L *19/00*
U.S. Cl. 15—434 **4 Claims**



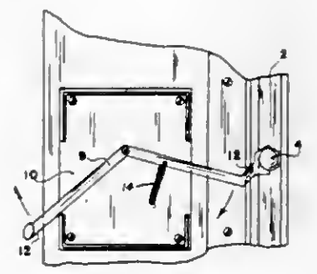
1. In an eraser device, the combination of: a thin flat eraser having two broad parallel faces, two narrow round side faces and a horizontally curved front face; means for holding the thin flat eraser in adjustable protrusion therefrom including a stiff eraser holder having a horizontally rounded open front end and comprising a front cover of inverted trough shape, a rear cover of inverted trough shape, a holder bottom of upright trough shape for assembly together with said front and rear covers so as to form an erasure enclosure, means for removably snapping the front cover and the rear cover in attachment with the holder bottom, the front cover having means for gripping said eraser upon attachment of the front cover to the holder bottom, the holder bottom having, at a forward location, inward sidewall protrusion for constricting the spacing between the side walls and laterally gripping the eraser, and the holder bottom having lug structure located for preventing the rear cover from sliding out of place forwardly during use of the erasing device.

4,028,772

SLIDING DOOR SAFETY DEVICE

Michael T. Salerno, Oakland, N.J., assignor to The Raymond Lee Organization, Inc., New York, N.Y., a part interest

Filed Apr. 26, 1976, Ser. No. 680,434
Int. Cl.² E05F *5/02*
U.S. Cl. 16—86 A **1 Claim**



1. A sliding door safety device for a sliding door slidably mounted in a door frame having a track slidably accommodating the door, said safety device comprising
a resilient ball; and
mounting means affixed to the door frame and supporting the ball in a manner whereby the ball is positionable in spaced relation with the door and the frame when the door is closed thereby permitting the door to be securely closed and is interposed between the door and the frame when the door is open thereby preventing the door from closing and protecting the fingers of unsuspecting people from being crushed between the door and the frame, said mounting means comprising a bell crank arm pivotally affixed intermediate the ends to a supporting surface adjacent the frame and having spaced opposite first and second ends, said ball being affixed to the arm at the first

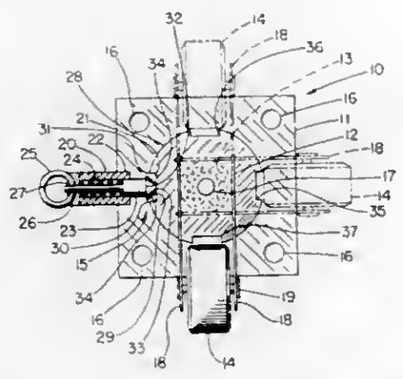
end thereof, a spring affixed at one end to said supporting surface and at its other end intermediate said arm, and said arm being movable by the action of the spring at the second end thereof to selectively move the ball into position between the door and the frame.

4,028,773

SWIVEL CASTER

Lawrence M. Morgan, Anoka, Minn., assignor to The Cornelius Company, St. Louis Park, Minn.

Filed Oct. 28, 1975, Ser. No. 626,122
Int. Cl.² B60B *33/00*
U.S. Cl. 16—35 R **1 Claim**



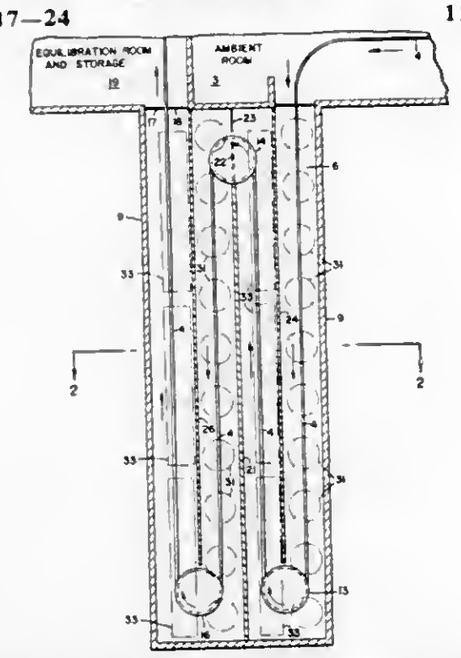
1. An improved swivel caster having a mounting plate, a swivel yoke, a swivel bearing connecting the yoke to the plate, and a wheel mounted on the yoke with the axis of the wheel spaced from the axis of the swivel bearing, the improvement comprising means for automatically indexing and de-indexing the yoke with respect to the mounting plate, said automatic indexing and de-indexing means having
   a. a cam formed of round disc rigidly mounted on the yoke co-axially with and in a plane perpendicular to the axis of the swivel bearing, said cam being co-rotatable with the yoke and having
      1. a circular surface concentric to the axis of the swivel bearing
      2. a plurality of radial cam ramps extending radially from the circular surface, said radial cam ramps being spaced every ninety degrees from each other about the circular surface,
      3. a pair of biasing surfaces in each radial ramp, there being a biasing surface on each side of each ramp, and
      4. a central index surface in each ramp and between a respective pair of biasing surfaces, each index surface being in a plane parallel to the axis of the swivel bearing;
   b. a latch mechanism mounted upon the mounting plate, said latch having
      1. a cam follower reciprocably displaceable within the latch, said cam follower having a cam engaging follower surface having
         a flat face surface lying in a plane parallel to the axis of the swivel bearing, said face surface having a width less than the width of said cam central index surface, and
         a follower flank surface on each side of the face surface, and
      2. means for resiliently biasing the cam follower into engagement against the cam, with
         a follower flank surface being angularly cammingly engagable with and against a respective cam biasing surface during rotation of the yoke with respect to the mounting plate, said latch being operable for radially biasing the yoke into a position of index upon contact of a follower flank surface against a cam biasing surface, and said cam being operable for displacing the cam follower from a radial ramp to the circular surface upon application of a predetermined torque between the yoke and the plate which torque is sufficient to overcome the pressure of the biasing means through the angular camming engagement between a cam biasing surface and a follower flank surface; and
   c. an arcuate width between the cam biasing surfaces, which arcuate width is greater than a corresponding width of the follower flank surfaces so that when the yoke is in a position of radial index with respect to the mounting plate, the yoke is held in a position of index solely by engagement of the follower face surface directly against the cam central index surface under pressure from the biasing means, with there being an arcuate spacing between each respective follower flank surface and cam biasing surface, said arcuate spacing providing a limited amount of resilient radial movement between the yoke and mounting plate to either direction from a position of index and prior to contact of a follower flank surface against a respective cam biasing surface, such radial movement being in response to a low torque between the yoke and plate, which low torque is less than the predetermined torque required to displace the follower from the cam radial ramp to the circular surface.

4,028,774

METHOD OF AND APPARATUS FOR CARCASS COOLING

John H. Allan; Jerrold L. Ball; Charles B. Dull; Leo A. Gabriel, all of Stockton; Richard E. Curtis, Foster City, and Victor J. Dervin, Cupertino, all of Calif., assignors to James Allan & Sons, Inc., Stockton and NPI Corporation, Burlingame, both of, Calif., part interest to each

Continuation of Ser. No. 545,138, Jan. 29, 1975, abandoned. This application July 2, 1976, Ser. No. 702,353
Int. Cl.² A22B *5/00*
U.S. Cl. 17—24 **11 Claims**



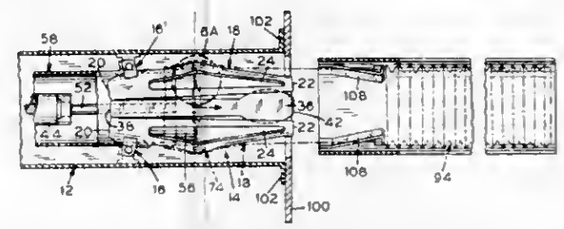
1. A device for cooling animal carcasses comprising an enclosure having an entrance and an exit, means including side walls, a floor and a partition wall dividing said enclosure into a horizontally sinuous passageway having at least a pair of adjacent aisles each of a width only slightly more than the width of one of said carcasses, said passageway opening at one end to said entrance and at the other end to said exit, means for vertically suspending and advancing animal carcasses through said passageway from said entrance to said exit, said carcasses advancing along first one of said aisles and then along the other of said aisles, a source of cooling air, a blower for blowing said cooling air downwardly in one of said aisles over carcasses hanging therein and for then drawing said cooling air upwardly in the other of said aisles over carcasses therein, the bottom of said partition wall being spaced upwardly from said floor to provide a path for flow of said air from said one aisle to said other aisle.

4,028,775

APPARATUS FOR INSERTING A SIZING DISC INTO A TUBULAR CASING

Oliver Joseph Tysver, Flossmoor, Ill., assignor to Union Carbide Corporation, New York, N.Y.

Filed May 4, 1976, Ser. No. 682,958
Int. Cl.² A22C *7/00*
U.S. Cl. 17—49 **24 Claims**



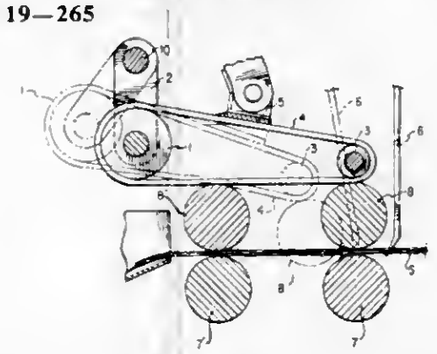
1. An apparatus for implanting a sizing disc into an unshirred open end portion of a shirred tubular casing wherein the sizing disc has a larger external periphery than the inflated inner periphery of said unshirred casing which, comprises in combination:
   a. a frame;
   b. casing spreader means positioned on said frame adapted for insertion into an unshirred open end portion of a casing for expanding said unshirred end portion, being further adapted for accommodating a sizing disc advanced into said unshirred end portion of said casing, and operable for uniformly contacting and locally stretching unshirred casing that surrounds the disc as the disc advances through said unshirred portion while maintaining fore and aft portions of casing adjacent to said surrounding casing in a relaxed condition; and,
   c. disc advancing means for advancing a disc through said casing spreader means and into said unshirred portion of said casing.

4,028,776

SWINGING INTERMITTENT DRIVE REVOLVING CLEARER

Yoshio Murao, 55, Masuizumimati Kanazawa Ishikawa, Japan

Filed Jan. 30, 1974, Ser. No. 437,864
Claims priority, application Japan, May 29, 1973, 48-63177
Int. Cl.² D01H *5/60*
U.S. Cl. 19—265 **3 Claims**



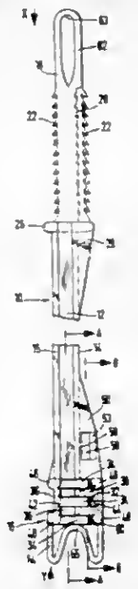
1. A revolving clearer for cleaning the upper drafting rollers of a textile machine wherein at least one of said drafting rollers is movable during a combing operation, wherein a top comb and said one drafting roller move in the same general direction, comprising:
   first and second rollers;
   an endless clearer cloth around said first and second rollers, said clearer cloth adapted to engage both of said upper drafting rollers; and
   a pair of spaced arms pivotally connected at their upper ends to the textile machine, one of said first and second rollers being rotatably supported in the lower portions of said arms.

4,028,777

CLAMPING RING AND CLOSURE MEANS

Alfred Schobel, and Wilhelm Schobel, both of D-7212, Deisslingen 2-Lauffen, Germany

Filed Feb. 3, 1976, Ser. No. 654,734
Claims priority, application Germany, Feb. 8, 1975, 2505425
Int. Cl.² B65D *63/00*
U.S. Cl. 24—16 PB **15 Claims**



1. A clamping ring and closure means made of plastics material comprising a closure head integrally formed at one end of a clamping ring of U-shaped section and which has a passage into which the opposite end of the clamping ring, which opposite end has the form of a tongue, can be inserted, and interlocking sawteeth or locking teeth provided on the side edges of the tongue and on the side walls of the passage, said closure head having side walls connected together by non-overlapping spacer webs which bound the passage on the upper side of the closure head and at the exterior of the base of the clamping ring, the sawteeth on the two side walls being in each case disposed opposite one another at the points of attachment of the spacer webs, the locking teeth disposed on the tongue, extending outwards at an acute angle in relation to the longitudinal axis of the clamping ring, and at their end surfaces extending approximately perpendicularly to said longitudinal axis, along one side edge of the tongue there being formed a reinforcing strip which projects in the direction of the open section side of the clamping ring and whose inner side is provided with sawteeth, while the locking teeth formed on this side edge are widened over its outer side, the lower spacer webs lying at the exterior of the base of the clamping ring section having in each case a portion which lies at the extremities of the limbs of the U-section and being offset in step form and which bounds a deeper portion of the passage corresponding to the reinforcing strip, and a bent-over portion of the spacer webs having a sawtooth facing the deeper portion of the passage.

4,028,778

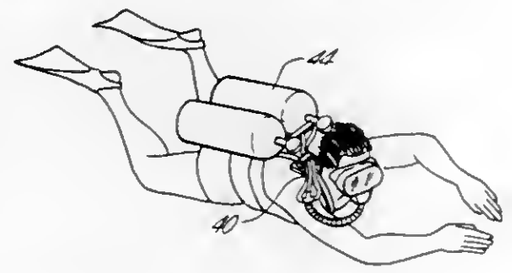
UNDERWATER BELT AND HOSE CLIP

Thomas J. Bardoni, 459 Poplar, Wyandotte, Mich. 48192, and William Markarian, 5970 Weddel, Taylor, Mich. 48180

Filed July 7, 1975, Ser. No. 593,719
Int. Cl.² A44B *11/00, 21/00*
U.S. Cl. 24—79 **7 Claims**

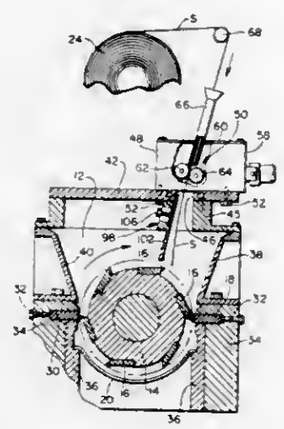
1. In an underwater swimming apparatus of the type having an oxygen tank, a hose leading from the tank to a central mouthpiece and a belt extending from the tank and being secured about the body of an underwater swimmer, a clip for retaining the belt and the hose, comprising:

a. a base having an upper surface and a lower surface, a recess being formed in the lower surface of the base,
b. means for receiving the belt formed in the base such that the belt extends through the clip and sets flush against the body of the user, the portion of the belt disposed beneath the base being nested in the recess,



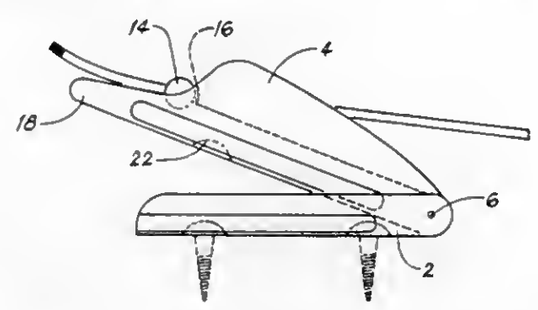
c. means for retaining the hose disposed on the base and comprising a U-shaped member having one leg rotatably secured to the base, and
wherein the clip prevents the hose from drawing back against the throat of the user.

4,028,779
FILM GRANULATOR
Sunil C. Shah, Cranston, R.I., assignor to Leesona Corporation, Warwick, R.I.
Filed Dec. 17, 1975, Ser. No. 641,827
Int. Cl.² B02C *18/22*
U.S. Cl. 241—73 **9 Claims**



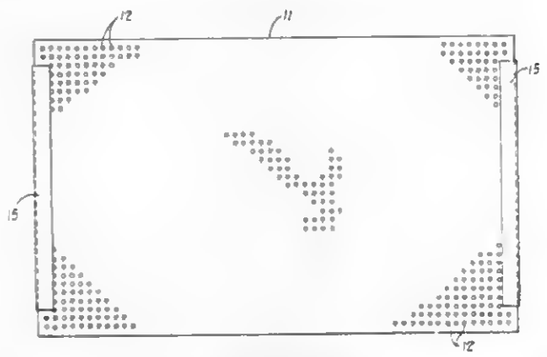
1. In combination with a granulator for size reduction of material, a feeding device for feeding sheet material thereto, said granulator including a chamber, a rotor mounted for rotation about an axis within said chamber, cutting means affixed on said rotor, bed knife means mounted for projection into said chamber at least on the downstroke side thereof for cooperative cutting relationship with said cutting means as said rotor is driven, screen means forming a lower portion of the boundary of said chamber whereby material reduced in size by said cooperative cutting relationship passes through said screen and is discharged from said chamber, said chamber being closed except for a narrow slot in the top thereof, said slot extending longitudinally along said axis and opening into said chamber on the downstroke side of said rotor, means adapted to positively drive sheet material directly into said chamber generally radially towards said rotor, including a longitudinally orientated baffle downwardly extending into said chamber from said chamber top, said baffle positioned proximate said slot and on the upstroke side thereof, said baffle approaching said rotor but spaced therefrom.

4,028,780
LINE RELEASING CLAMP
Kenneth O. Vernon, 2001 Stanwood Drive, Santa Barbara, Calif. 93103
Filed Feb. 10, 1976, Ser. No. 656,958
Int. Cl.² F16G *15/00*
U.S. Cl. 24—116 R **8 Claims**



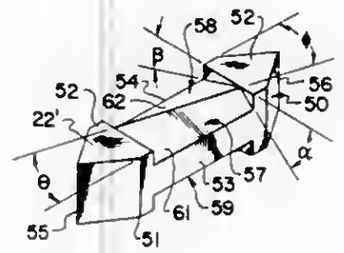
1. A clamp for holding a line, the clamp including a saddle incorporating a channel shaped to receive a line and means for releasably securing the line to the saddle,
a clip for holding the saddle, the clip including means for securing it to an element to resist tension on the line received in the saddle,
means pivotally attaching the saddle to the clip, the pivot being spaced from the axis of the channel in the saddle which receives the line, and
means releasably attaching the saddle to the clip so that when the saddle is released by the clip, the saddle is free to pivot substantially unrestricted by the clip, the line securing means releasing the line as the saddle pivots about the clip.

4,028,781
SURFACING TOOL
Joseph D. Konrad, 6340 Stumph Road, Apt. 311-B, Parma Heights, Ohio 44130
Filed July 21, 1976, Ser. No. 707,366
Int. Cl.² B23D *71/00*; **B21K** *21/00*
U.S. Cl. 29—78 **10 Claims**



1. A surfacing tool consisting essentially of a rectangular metal sheet ranging in thickness from about 0.008 to about 0.02 inch having a flat central portion and opposed end portions,
said flat central portion being perforated with holes all punched in the same direction in said portion, each hole having a minimum lateral dimension of about 0.03 inch and a maximum lateral dimension of about 0.16 inch, the total area of said punch holes being no greater than the total area of non-perforated metal, the minimum distance between the edge of any hole and the edge of any adjacent hole being no less than about 0.75 times the smallest lateral dimension of the smaller of the two holes nor more than about four times the minimum lateral dimension of the larger of the two holes, the burrs produced from the punching of said holes ranging in length from about 0.03 to about 0.13 inch, and
said opposed end portions being adapted for attachment to a motor-powered reciprocating drive means such that said burrs are fully exposed.

4,028,782
CUTTING INSERT AND TOOL HOLDER ASSEMBLY THEREFOR
Donald Edward Stansak, Wyano, Pa., assignor to Teledyne Mid-America Corporation, Los Angeles, Calif.
Continuation-in-part of Ser. No. 494,379, Aug. 5, 1974, abandoned. This application Feb. 13, 1976, Ser. No. 658,002
Int. Cl.² B26D *1/00*
U.S. Cl. 29—95 R **16 Claims**

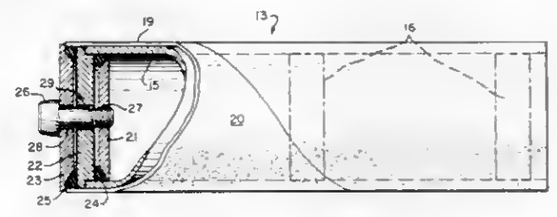


1. A cutting insert comprising:
A. a body of hard wear resistant material having first and second opposed major surfaces, at least one indexing surface capable of precision indexing of the body in a tool holder and at least one cutting edge at an end portion for cutting metal;
B. at least one notch in said first major surface adapted to rigidly hold the body in a tool holder with the indexing surface and a bridge clamp, said notch having an engaging surface forming a compound angle with said first major surface defined by an angle of greater than about 10° and less than about 30° to the indexing surface and an angle of greater than about 3° to a plane defined by the first major surface.

9. A tool holder assembly comprising:
A. a tool holder having a cut-out therein for precision indexing of a cutting insert for the cutting of metal;
B. a bridge clamp for holding a cutting insert in said cut-out of the tool holder, said bridge clamp being removably fastened to said tool holder;
C. a cutting insert of hard wear resistant material having first and second opposed major surfaces, at least one indexing surface capable of precision indexing of the insert in the cut-out of the tool holder and at least one cutting edge at an end portion for cutting material; and
D. at least one notch in said first major surface adapted to rigidly hold the cutting insert in the cut-out of the tool holder with the indexing surface and the bridge clamp, said notch having an engaging surface forming a compound angle with said first major surface defined by an angle greater than about 10° and less than about 30° to the indexing surface and an angle greater than about 3° to a plane defined by the first major surface.

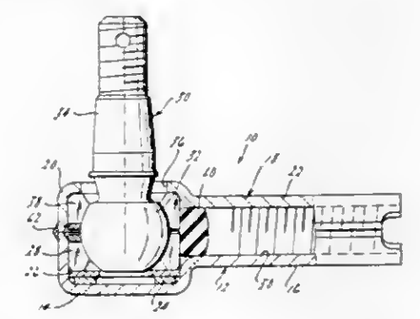
4,028,783
IDLER ROLL FOR PRINTING PRESS DRYING STAGE
Homer G. Buck, Newport, Oreg., assignor to King Label Company, El Segundo, Calif.
Continuation of Ser. No. 562,260, March 26, 1975, abandoned. This application May 14, 1976, Ser. No. 686,370
Int. Cl.² B41F *13/02*
U.S. Cl. 29—117 **4 Claims**

1. An idler roll for engaging a printed side of a running web trained thereover comprising:
a unitary rotatable support member of a rigid material having a hard smooth cylindrical external surface;
a sleeve of hollow cylindrical configuration made of stiff material with an internal surface telescopically matingly engaged with the external surface of said support member and having an external surface that is coated with grit for contacting a printed side of a web to be trained thereover;
and means at one end of said support member detachably interconnecting said support member and said sleeve at said one end for keying them together against both relative angular and relative axial displacement of said support member and said sleeve during operation of the idler roll, said means being actuable to disconnect said support member and said sleeve to permit said sleeve to be slideably withdrawn axially endwise over said one end of said support member;



said rotatable support member being of tubular configuration and said sleeve having an end portion projecting axially beyond an adjacent end of said support member;
said keying means comprising a coaxial series of an inner disc receivable within said member, a median disc formed with an annular shoulder seatable on an end of said support member within said projecting end portion of said sleeve, and an outer disc engageable with an end of said sleeve;
said keying means further comprising a first radially expandable and radially retractable element intermediate said inner and median discs and a second radially expandable and radially retractable element positioned between said median and outer discs.

4,028,784
PRELOADED TIE ROD END ASSEMBLY
William D. Allison, Grosse Pointe Farms, Mich., assignor to Ford Motor Company, Dearborn, Mich.
Division of Ser. No. 593,808, July 7, 1975. This application Apr. 12, 1976, Ser. No. 675,655
Int. Cl.² B21D *53/10*
U.S. Cl. 29—149.5 B **4 Claims**



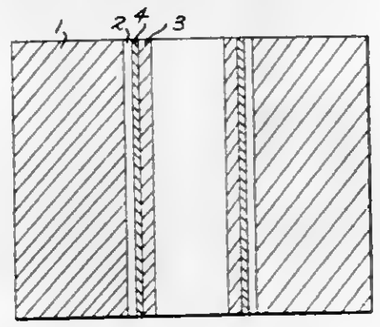
1. A method of making a preloaded tie rod end assembly comprising:
forming a first housing and a second housing each with a socket part and a stem part;
assembling a one-piece frangible bearing and the ball of a ball stud between said socket parts of said first and said second housings;
exerting a load on said first and second housings causing said bearing to fracture into a plurality of bearing elements;

securing said first and second housings together by welding while maintaining said load on said bearing.

4,028,785
TUBULAR PRODUCTS

Kenneth Thomas Jackson, Leeds, and Lance Porter, Walton, near Wakefield, both of England, assignors to Yorkshire Imperial Metals Limited, Leeds, England

Filed May 30, 1974, Ser. No. 474,857
Claims priority, application United Kingdom, June 6, 1973, 26988/73
Int. Cl.² B23P *15/26*
U.S. Cl. 29—157.3 R **15 Claims**

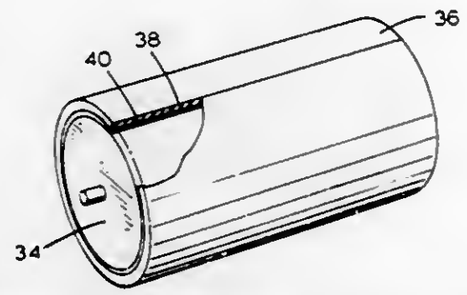


1. A method of producing a composite tubular product comprising assembling concentrically a first tubular member of a highly corrosion resistant reactive metal which is selected from the group consisting of titanium, tantalum and zirconium and a second tubular member of a highly thermally conductive metal which is selected from the group consisting of copper and copper alloy with a relatively narrow annular gap therebetween, there being a layer of coating of a metal selected from the group consisting of copper and nickel on the surface of the first member facing towards the second member, heating the assembly to an extrusion temperature at which diffusion occurs at the interface between the reactive metal and the layer or coating thereon, and then extruding the assembly at that temperature to bond the layer or coating to the highly thermally conductive metal, a diffusion bond being formed between the reactive metal and said coating.

4,028,786
PRINTING AND LIKE ROLLERS

William Boyd Dempster, Mississauga, Canada, assignor to Canathane Roller Corporation Limited, Downsview, Canada

Division of Ser. No. 513,185, Oct. 8, 1974, Pat. No. 3,997,645. This application July 14, 1976, Ser. No. 705,185
Int. Cl.² B21B *31/08*
U.S. Cl. 29—132 **5 Claims**

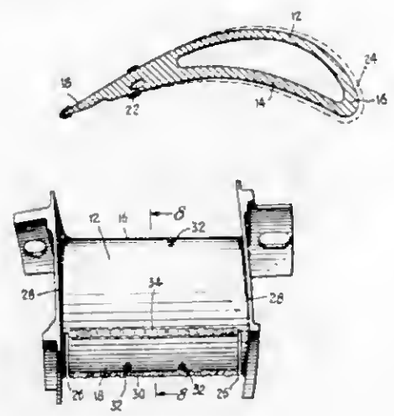


1. A roller for applying varnish, lacquer, ink and the like to sheet material, the roller comprising a magnetic cylindrical former, and a cover which is applied to the curved surface of the former and is magnetically retained thereon, the cover comprising a hollow cylindrical casting having an inside diameter equal to the outside diameter of the former and comprising an outer layer made from a castable material which is selected from the group comprising liquid polymeric systems and liquid prepolymeric systems capable of forming macromolecular structures having elastomeric properties and an inner layer made from a material which is selected from said group, which is capable of bonding with the outer layer and which has particles of a magnetic material dispersed therein.

4,028,787
REFURBISHED TURBINE VANES AND METHOD OF REFURBISHMENT THEREOF

Salvatore J. Cretella, 180 Fitch St., North Haven, Conn. 06473; Matthew Bernardo, 62 Lee St., West Haven, Conn. 06516, and Ralph T. De Musis, 547 Foxon Road, North Branford, Conn. 06471

Filed Sept. 15, 1975, Ser. No. 613,479
Int. Cl.² B23P *15/04, 7/00*
U.S. Cl. 29—156.8 B **1 Claim**



1. The method of refurbishing a turbine vane, which includes the steps of welding cracks in the vane surface, slitting portions of the vane at the two ends of the trailing edge to relieve stresses in the vane, welding the trailing edge of the vane to build up the same, welding an elongate surface portion of the vane spaced from and substantially coextensive with the trailing edge to reinforce the vane, welding the slitted portions closed, plasma spraying molten metal or eroded surfaces of the vane to build up the same beyond the original surfaces, and grinding down the built-up surfaces to refinish the same to conform with the original vane surfaces.

4,028,788
METHOD OF REFURBISHING TURBINE BLADE AIR SEAL FLANGES

Ralph T. DeMusis, 547 Foxon Road, North Branford, Conn. 06471

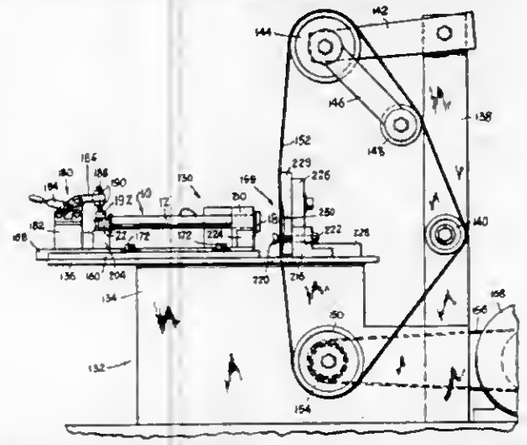
Filed Jan. 12, 1976, Ser. No. 648,388
Int. Cl.² B23P *15/02, 7/00*
U.S. Cl. 29—156.8 B **2 Claims**

1. The method of refurbishing the elongate air seal flanges of worn turbine blades, which includes the steps of:

a. adding a bead of welding material to worn areas of the air seal flange of a blade so as to build up portions thereof which have been worn away, and thereafter in a machine having a work-performing station, a power driven abrasive belt adjacent the station and a contoured back-up shoe having a planar front surface containing an elongate recess characterized by a curved surface with a profile resembling that of the original geometry of the air seal flange of a turbine blade but of greater length than said flange whereby portions of the belt occupying said recess can have a length in excess of the length of the air seal flange, said shoe being engageable with the back of the belt such that the latter can yield and conform to the profile when its abrasive surface is engaged by a workpiece, and having a slide advanceable toward the work-performing station, the steps of:

b. clamping the blade onto said slide, with its air seal flange facing said work-performing station and extending substantially parallel to that portion of the belt at said station, and

c. advancing the slide and blade a sufficient distance toward the work-performing station to cause the edge of the air seal flange to engage the abrasive surface of said belt and force the latter to yield an extent and conform to the



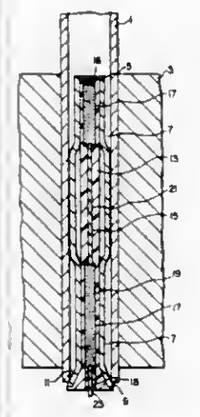
particular curved profile of the recess in the back-up shoe while it removes a portion of the welded material, thereby to restore the flange edge to its original curved geometry closely resembling the curved profile of the recess of said back-up shoe,

d. the advance of the slide and blade being sufficiently large to bring the foremost edge of the flange of the blade into the recess of the back-up shoe and past the planar front surface thereof.

4,028,789
METHOD OF INSTALLING A SLEEVE IN ONE END OF A TUBE

Emil P. Loch, Tampa, Fla., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Mar. 29, 1976, Ser. No. 671,885
Int. Cl.² B21D *39/06;* **B23P** *15/26*
U.S. Cl. 29—157.4 **18 Claims**



1. The method of installing a sleeve in one end of a tube disposed in a tube sheet of a heat exchanger, said method comprising the steps of:

forming the sleeve so that it has an outer diameter sufficiently smaller than the inner diameter of the tube to provide an annular space therebetween,

flaring one end of the sleeve to such an extent that the flared end is larger in diameter than the inside diameter of the tube,

inserting the sleeve in the one end of the tube so that the flared end wedges itself against the tube to position the sleeve in the tube and form an annular space therebetween,

forming an insert of resilient material so that it fits snugly within the sleeve and has a relatively large diameter cylindrical chamber disposed adjacent the flared end of the sleeve and a smaller diameter cylindrical chamber extending from the larger diameter cylindrical chamber and away from the flared end of the sleeve,

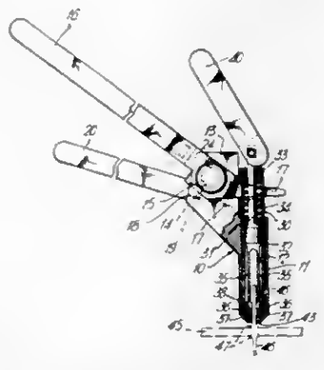
placing explosive material in the chambers, and

detonating the explosive materials, whereby the flanged end of the sleeve is explosively welded to the tube and the sleeve adjacent the smaller diameter cylindrical chamber is explosively expanded into engagement with the tube, and forming a metallurgical bond between the end of the sleeve opposite the flared end and the tube.

4,028,790
REMOVAL OF CONNECTOR PINS

Jean Marcel Dupuis, Ottawa, Canada, assignor to Northern Telecom Limited, Montreal, Canada

Filed Mar. 25, 1976, Ser. No. 670,538
Int. Cl.² H05K *3/00*
U.S. Cl. 29—764 **2 Claims**



1. Apparatus for removing a pin extending from a panel and soldered to at least one surface thereof, comprising:

a main body member including a hollow bottom portion and an offset top portion, said bottom portion including an inwardly extending annular flange having a bottom face for positioning against said panel;

a fixed handle attached to said top portion and extending laterally therefrom;

a moveable handle pivotally mounted on said top portion, moveable about a pivot extending normal to the axis of said fixed handle, said moveable handle including a main portion on one side of said pivot and overlying said fixed handle and also including an extension on the other side of said pivot;

a tubular member mounted in said hollow bottom portion for axial movement therein, said tubular member including a tapered bore at a lower end, said tapered bore extending downwardly and inwardly, and at least one protrusion at an upper end, said protrusion in engagement with said extension on said moveable handle, the lower end of said tubular member resting against said annular flange of said bottom portion of said body member;

a gripping member mounted in said tubular member for axial movement therein, said gripping member comprising a central part a close sliding fit in said tubular member for guidance of said gripping member, a lower part of hollow form and split longitudinally to form two opposed gripping surfaces, and an upper part of reduced diameter and extending up through the upper end of said tubular member beyond said extension on said moveable hand and said protrusion on said tubular member, said central part forming a lower abutment for a spring;

an abutment at the upper end of said tubular member and a compression spring extending between said abutments; and

a cam lever pivotally mounted on the upper end of said upper part of said gripping member, said cam lever pivotal about an axis normal to the longitudinal axis of said

gripping member, said cam lever engaging with the upper end of said tubular member, pivotal movement of said cam lever lifting said gripping member axially relative to said tubular member to open said lower part of said gripping member and retains said pin;

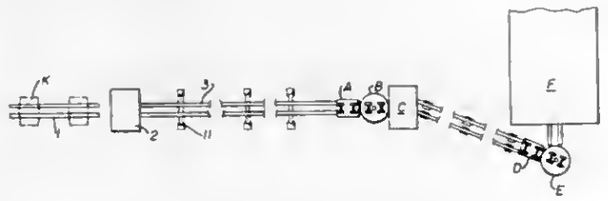
the arrangement such that pivoting of said moveable handle to move said main portion toward said fixed handle, moves said extension in a direction away from said bottom portion of said body member, said extension in engagement with said protrusion to move said tubular member axially, initial movement of said tubular member forcing said extremity of said gripping member into engagement with a pin within said gripping member, further movement pulling said tubular member, gripping member and pin from said panel, shearing the solder joint, reaction on said body member holding said bottom face in contact with said panel.

4,028,791

KEG HANDLING APPARATUS AND METHOD

Ernest J. Hodgetts, Spruce Grove, Canada, assignor to The Molson Companies Limited, Spruce Grove, Canada

Filed Aug. 10, 1976, Ser. No. 713,118
Claims priority, application Canada, May 13, 1976, 252504
Int. Cl.² B23P *19/02*
U.S. Cl. 29—427 **6 Claims**



1. A method of conveying empty beer kegs through one keg handling apparatus to other keg handling apparatus including the steps of:

a. elevating each keg to the uppermost one of a plurality of superposed conveyor belts;

b. conveying said kegs along said uppermost conveyor belt to a deflector located at the distal end thereof;

c. conveying said kegs along the next successive belt to the terminal end thereof, the belts of each superposed pair thereof, where they face one another, being so tensioned that they engage the periphery of each keg and urge it along the path of travel; and

d. transferring said kegs from said lowermost conveyor belt to said other keg handling apparatus, which is adapted to remove and object from one end of each keg.

4,028,792

METHOD OF ERECTING A TOWER CRANE FROM TWO GROUPS OF MODULAR TOWER SECTIONS DIFFERING IN CROSS SECTION

Hans Tax, Munich, and Klaus Hösler, Eichenau, both of Germany, assignors to Hans Tax, Munich, Germany

Filed Apr. 29, 1976, Ser. No. 681,436
Claims priority, application Germany, May 9, 1975, 2520717
Int. Cl.² E04H *12/34*
U.S. Cl. 29—431 **10 Claims**

1. A method of erecting a tower crane from a boom assembly, a plurality of first modular tower sections, a plurality of second, tubular, modular tower sections of larger cross section than said first sections, and a base, which comprises the steps of:

a. mounting said boom assembly on a hollow climbing section dimensioned to be received in each of said second sections and defining a cavity dimensioned to receive each of said first sections, said cavity being open in at least one direction;

b. securing one of said first sections on said base in an upright position, and receiving the upright section in said cavity;

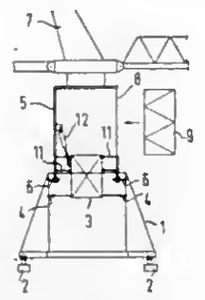
c. raising said climbing section relative to said one first section by interposed hoisting means;

d. partly enveloping the raised climbing section by one of said second sections;

e. securing said one second section to said base and to said raised climbing section for transmitting weight therebetween, and releasing said one first section from said base;

f. raising the released first section relative to said climbing section by interposed hoisting means and securing the raised first section to the secured second section;

g. releasing said climbing section from said one second section and raising said climbing section by interposed hoisting means relative to the raised first section;



h. thereafter enveloping said climbing section by another second section and securing said another second section to said one second section in vertically offset relationships and to said climbing section;

i. releasing said one first section from said one second section, raising the released first section relative to said climbing section by interposed hoisting means, and securing the raised first section to said another second section;

j. releasing said climbing section from said another second section and raising the released climbing section relative to said first section by interposed hoisting means until a portion of said cavity intermediate said boom assembly and said one first section is cleared;

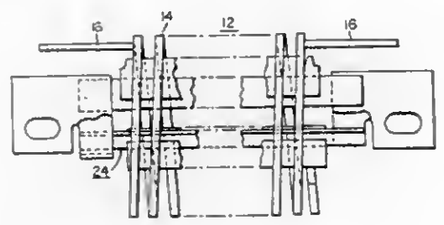
k. inserting another first section in said portion of said cavity, and securing the inserted other first section to said boom assembly and to said one first section in weight transmitting relationship.

4,028,793

METHOD OF ASSEMBLING HELICAL RESISTOR

Marvin E. Liebler, Tonawanda, and Eugene J. Lum, Williamsville, both of N.Y., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Division of Ser. No. 591,246, June 27, 1975, Pat. No. 4,001,761. This application Sept. 13, 1976, Ser. No. 722,834
Int. Cl.² H01C *17/04*
U.S. Cl. 29—618 **6 Claims**



1. A method for assembling a resistor having a helical resistance element and an internal insulating assembly supporting said resistance element at a plurality of points, comprising the steps of:

forming a ribbon of resistance material into an edge-wound helix;

welding each end of a first support bar to corresponding first arms of first and second asymmetrical spreaders each having a plurality of radially extending arms;

affixing insulating means to said first support bar;

affixing insulating means to a plurality of additional support bars;

placing a first subassembly comprising said first support bar, said insulating means, and said spreader members into the interior of said helix;

inserting additional subassemblies comprising all but one of said additional support bars and insulating means into the interior of said helix and welding each end of said all but one additional support bars to corresponding radially extending arms of said first and second spreaders;

inserting a last subassembly comprising the last of said additional support bars and said insulating means into the interior said helix;

spreading said last subassembly radially outward along corresponding empty arms of said first and second spreader members against the interior of said helix to firmly position each of said subassemblies against the interior of said helix; and

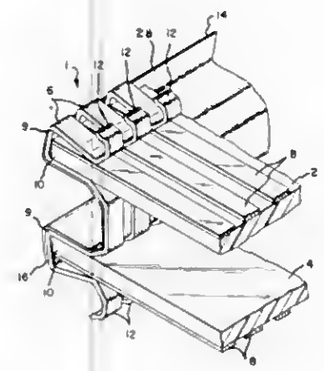
welding each end of said last support bar to said corresponding empty radially extending arms of said spreaders.

4,028,794

LAMINATED CONNECTOR

Leon Thomas Ritchie, and Robert George Harwood, both of Mechanicsburg, Pa., assignors to AMP Incorporated, Harrisburg, Pa.

Division of Ser. No. 504,579, Sept. 9, 1974, abandoned, which is a continuation-in-part of Ser. No. 432,121, Jan. 9, 1974, abandoned. This application Jan. 7, 1976, Ser. No. 647,012
Int. Cl.² H02G *15/00*
U.S. Cl. 29—629 **6 Claims**



1. A method for making a free standing and self-supporting multi-terminal electrical connector, comprising the steps of:

cutting a plurality of elongated contacts from a continuous sheet of electrically conductive resilient spring material;

laminating at least one continuous web of flexible insulative support material to intermediate portions of each of said contacts to hold them in fixed parallel spaced relationship, each said contact having at least one end projecting beyond a marginal edge of said web, said web being sufficiently rigid to prevent relative flexure between adjacent contacts while allowing individual outward flexing of the free ends of the contacts; and

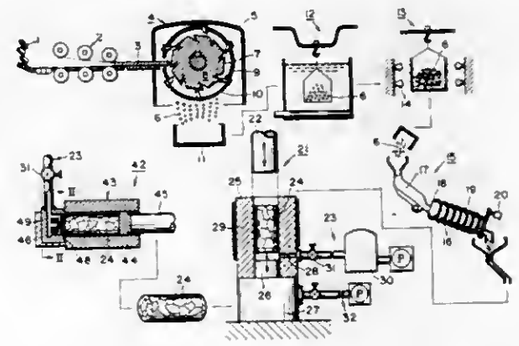
bending portions of said metal contacts into permanent curvilinear shapes to define at least one substantially U-shaped end portion adapted to grippingly receive a mating member therein, said contacts being separated from one another lengthwise along said insulative support material, said contacts being of sufficient metal thickness to be free standing and self-supporting and to provide resilient spring action for applying pressure at said contact end portions.

4,028,795

METHOD OF MANUFACTURING EXTRUDED STRUCTURAL PROFILES FROM ALUMINUM BASED METAL SCRAPS

Toshiro Takahashi; Toshihiro Nagano; Katsuhiko Nakamura, all of Shizuoka, and Masaru Kikuchi, Fuji, all of Japan, assignors to Riken Keikinzoku Kogyo Kabushiki Kaishi, Shizuoka, Japan

Filed July 8, 1975, Ser. No. 593,996
Claims priority, application Japan, Dec. 10, 1974, 49-141893
Int. Cl.² B21C *23/01*, *23/04*
U.S. Cl. 29—403 **1 Claim**



1. A method of manufacturing extruded structural profiles from aluminum based metal scrap materials comprising;

passing and lapping the aluminum based scrap materials through and between rollers to form a laminated sheet plate,

breaking the laminated sheet plate into chip materials,

heating the chip materials to a temperature sufficient to effect a hot press and a hot extrusion,

charging the heated chip materials into a press housing,

evacuating the interior of the press housing to exhaust air from between and about the chip materials,

compacting the chip materials into a substantially cylindrical body in the press housing by applying a pressure force to the chip materials in the press housing in the range of about 0.4 to 2 ton/cm², the cylindrical body having a density greater than 70 percent of that of an aluminum material,

inserting the compacted body of chip materials into an extruder housing,

disposing a blind die in air-tight relation with the extruder housing,

evacuating air from in and about the body of chip materials and in the extruder housing while the blind die lies in such air-tight relation with the extruder housing so that the reduced pressure in the housing is in the range of about 20 to 50 mmHg.

replacing the blind die by an open die having a desired extruder opening therein under the evacuated condition in the interior of the housing,

compressing the cylindrical body into a semi-solid consolidation body to be deformed in air-tight contact with the extruder housing, and

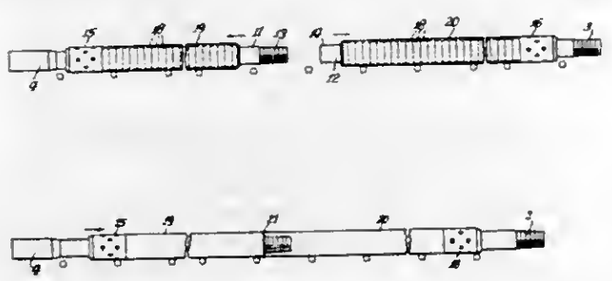
extruding the semi-solid consolidation body through the extruder die opening to form the desired shape.

4,028,796

METHOD OF MAKING A BLAST JOINT

Arthur Everett Bergstrom, 5410 Bergstrom Lane, Houston, Tex. 77088

Division of Ser. No. 600,616, July 31, 1975. This application June 23, 1976, Ser. No. 699,194
Int. Cl.² B23P *17/00*
U.S. Cl. 29—416 **7 Claims**



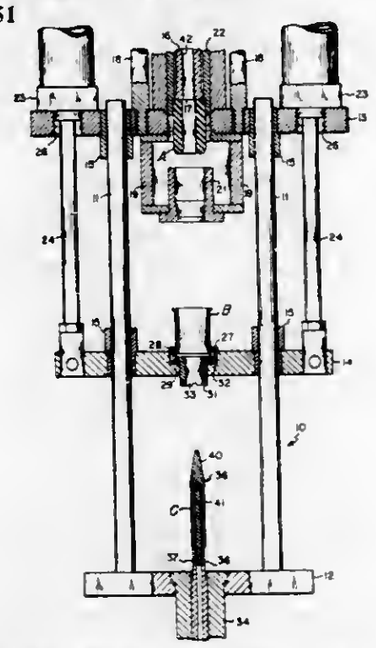
6. The method of producing a carbide protected blast joint of flow tubing which comprises forming two sections of flow tubing with adjacent ends formed into cooperating parts of a threaded flush joint and their remote ends into a pin joint and a box joint respectively, passing a longitudinally adjustable clamping ring over each of said sections to a point adjacent the outer ends of said sections, threading an array of cylindrical ended tungsten carbide rings over each of the said adjacent ends of flow tubing, passing a protective outer metallic sleeve endwise over each of said array of rings, then threading the flush joint threaded parts of the two sections of flow tubing together, then moving said rings and their protective metallic sheath sections endwise into a compact body and then welding the adjacent ends of the outer metallic sleeve together.

4,028,797

METHOD FOR ASSEMBLING RESILIENT BUSHINGS

Harvey E. Miller, Logansport, Ind., assignor to The General Tire & Rubber Company, Akron, Ohio

Continuation of Ser. No. 248,097, April 27, 1972, abandoned. This application Oct. 17, 1975, Ser. No. 623,515
Int. Cl.² B23P *11/02*
U.S. Cl. 29—451 **2 Claims**



1. In a method for assembling a resilient bushing having an outer sleeve, an inner sleeve and an annular elastomeric insert radially compressed between said sleeves comprising:

mounting said insert in compression within said onter sleeve, and,

expanding the interior of said insert when mounted within said outer sleeve and mounting said inner sleeve within said insert as expanded to place said insert in radial compression between said sleeves with means including an expanding mandrel preceding said inner sleeve through said insert and expanding the interior of said insert at a predetermined rate of expansion to mount said inner sleeve within said insert when so expanded;

the movement wherein: said expanding mandrel is provided with a radial profile conforming to the relation:

$$X_7' = \tfrac{1}{2}\left(X_6^2 - \frac{Q}{+t_u^n R}\right)^{\frac{1}{2}} \text{ where}$$

$$\frac{Q}{(X_6^2 - X_0^2)}$$

X_7' = the radius of said mandrel at every point t_u extending from the leading end of said mandrel along the entire length t_1 thereof; and where

$$R = \left(\frac{Q}{(X_6^2 - X_7^2)} - \frac{Q}{X_6^2 - X_0^2}\right)\frac{1}{t_1^n}; \text{ and}$$

$$Q = (X_1 + X_2)(X_3^2 - X_5^2) + X_2(X_4^2 - X_5^2);$$

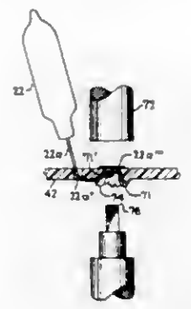
X_0 = inner diameter of said insert when compressed within said outer sleeve;
X_1 = effective length of said insert
X_2 = length of any extension portion to said insert when uncompressed which contributes to its elongation;
$X_2 = 0$ without contribution to elongation;
X_3 = outer diameter of said insert when uncompressed;
X_4 = leading diameter of X_2; $X_4 = 0$ when $X_2 = 0$;
X_5 = inner diameter of said insert when uncompressed;
X_6 = inner diameter of said outer sleeves and outer diameter of said insert when compressed therein;
X_7 = outer diameter of said inner sleeve and inner diameter of said insert when compressed between said sleeves; and
n = a positive integer selected from the numbers 1 and 2; whereby the force required for assembling the inner sleeve in the insert is held to a minimum.

4,028,798

METHOD OF MAKING ELECTRICAL CONNECTIONS

Conrad E. Bechard, Chagrin Falls; John M. Davenport, Euclid; William H. Herrmann, East Cleveland, and Steven N. Lovrekovic, Cleveland, all of Ohio, assignors to General Electric Company, Schenectady, N.Y.

Filed Apr. 9, 1976, Ser. No. 675,617
Int. Cl.² H01R *43/00*
U.S. Cl. 29—628 **20 Claims**



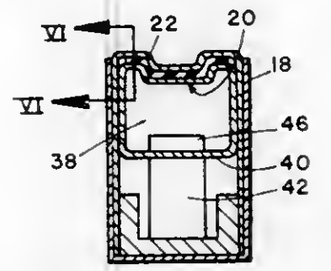
1. A method of connecting an elongated conductive member to a conductor carried by an insulative member, comprising the steps of positioning said conductive member alongside said insulative member in alignment with said conductor, and driving and bending one or more portions of the conductive member sideways into the insulative member to cause the conductive member to engage against and make electrical contact with said conductor and to be embedded and held in position by flow and subsequent solidification of material of the insulative member around said conductive member at one or more regions thereof.

4,028,799

SHARPENERS FOR ELECTRIC SHAVERS

James E. Rookus, 505 Cherry, SE., Grand Rapids, Mich. 49503

Continuation-in-part of Ser. No. 478,645, June 12, 1974, Pat. No. 3,935,638, which is a continuation-in-part of Ser. No. 436,174, Jan. 24, 1974, abandoned. This application Dec. 17, 1975, Ser. No. 641,661
Int. Cl.² B26B *19/38*
U.S. Cl. 30—37 **7 Claims**



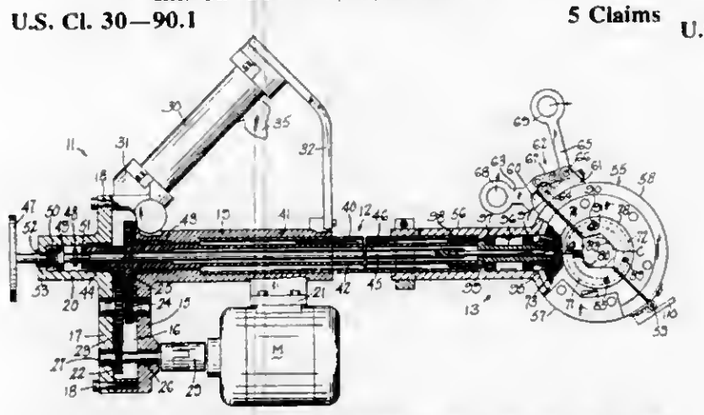
7. In an electric shaver having an elongated head portion and a housing, the head portion having a cutter blade and a shear plate and resilient means normally biasing said cutter blade against said shear plate, means for sharpening the cutter blade, an elongated blade member positioned in and mounted for reciprocation with respect to the inner surface of said shear plate, and means securing said head portion in position on the shaver housing, said securing means including means engaging said head portion at the ends thereof comprising: a thin sheet seated between said blade and said shear plate and pressed by said cutter blade against the inner surface of said shear plate, said thin sheet having a lower surface overlying and engaging the entire cutting surface of said blade; said thin sheet having a length corresponding to the spacing between said engaging means at the ends of said head portion and being locked therebetween and held stationary; a layer of abrasive material on the lower face of that portion of said thin sheet which overlies the cutting surface of said blade whereby said blade is sharpened when it is reciprocated.

4,028,800

CABLE SHAVING TOOL

James J. Matthews, East Haddam, Conn., assignor to Utility Tools Corporation, Cromwell, Conn. and Utility Tools Corporation, Cromwell, Conn.

Filed Oct. 2, 1975, Ser. No. 618,749
Int. Cl.² B21F *13/00*; **B26B** *27/00*
U.S. Cl. 30—90.1 **5 Claims**



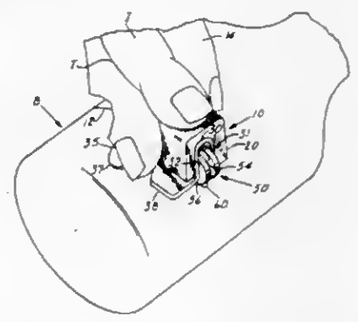
1. A cable shaving tool comprising a shaving head having a fixed portion and a relatively rotatable portion, a shaving blade mounted on the rotatable portion and rotatable therewith, means for rotating the rotatable portion which means includes gears in the shaving head and remotely located means for driving said gears, the rotatable portion including one of said gears, the shaving head and at least one gear being split on a diametrical plane, the parts being hinged together, and a releasable lock being provided to bolt together the hinged parts, means retaining the split gear portions in operative relation to the split shaving head portion, whereby the shaving head is adapted to be applied in open position to a cable to be shaved and closed around said cable with the shaving blade and gears in operative position.

4,028,801

HAND-HELD GLASS CUTTER

Ephrem J. Gelfman, R.F.D. No. 1, Sparta, Wis. 54656

Filed Apr. 12, 1976, Ser. No. 675,545
Int. Cl.² B26B *25/00*
U.S. Cl. 30—164.95 **9 Claims**



1. A hand-held glass cutter for scoring flat and curved surfaces comprising:

a housing, including finger gripping surfaces thereon and a cutter wheel support generally disposed at the bottom of said housing substantially along a central axis thereof and provided with a front portion and a rear portion;

a cutter wheel assembly including at least one rotatably journaled cutter wheel disposed at the front portion of said cutter wheel support, said cutter wheel having a sharpened cutting edge around its peripheral surface; and

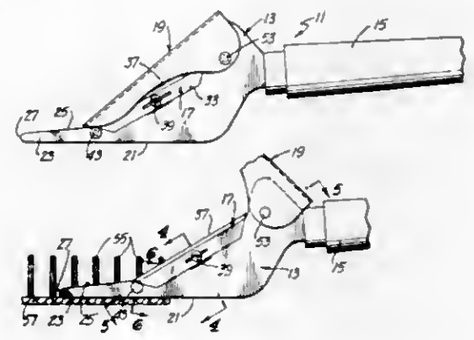
spaced support means extending downwardly from the rear portion of said cutter wheel support on opposite sides of the central axis defining laterally spaced points of support rearwardly of said cutter wheel.

4,028,802

LOOP CUTTING TOOL

George L. Houghton, Santa Ana, and Fred F. Fredensberg, Newport Beach, both of Calif., assignors to Rug Crafters, Santa Ana, Calif.

Filed Nov. 6, 1975, Ser. No. 629,325
Int. Cl.² B26B *5/00*, *29/00*
U.S. Cl. 30—294 **11 Claims**



1. A loop cutting tool for cutting loops comprising:

a body member of sheet material, said body member having

an elongated nose at one end of the body member and a guiding edge forming one edge of said nose, said nose having a second edge;

handle means on the body member at the other end thereof;

a region of the sheet material of said body member between said handle means and said elongated nose defining a blade supporting section, said blade supporting section including a side wall and a ledge and having a recess with a substantially open side with said side wall being opposite said open side and said ledge extending along an edge of the recess;

a blade having first and second opposite sides, a cutting edge, and a noncutting edge;

means for attaching said blade to said side wall with said blade being received in said recess, said first side of said blade confronting said side wall, at least a portion of said noncutting edge confronting said ledge, said cutting edge being exposed and extending substantially to the second edge, said second side of said blade being exposed through the open side of said recess, and said cutting edge forming an acute angle with said guiding edge;

means adjacent the intersection of said cutting edge and said second edge cooperating with said side wall and said ledge to define a channel for receiving the region of said blade lying closely adjacent said second edge and for preventing the material of the loops from being caught between the blade and the body member during use of the tool; and

a guard positionable over said cutting edge.

4,028,803

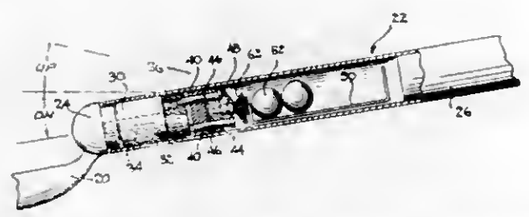
LOCKING MECHANISM

Phillip V. Currie, 19702 Sacramento Lane, Huntington Beach, Calif. 92646

Filed July 6, 1976, Ser. No. 702,418

Int. Cl.² B26B *1/04*

U.S. Cl. 30—321 17 Claims



1. A locking mechanism for controllably locking a first assembly to a second assembly against relative rotation about an axis comprising:

a first means rotationally coupled to said first assembly having a first plurality of openings distributed about said axis;

a second means rotationally coupled to said second assembly, said second means having a second plurality of openings distributed about said axis, said second plurality of openings being different in number from said first plurality of openings;

a plurality of locking members, each of said locking members being disposed in one of said openings in said second member; and

means for selectively encouraging said locking members toward engagement with said openings in said first member.

4,028,804

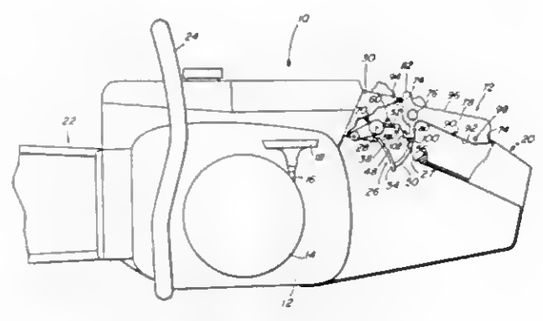
CHAIN SAW WITH THROTTLE CONTROL

Walter J. Hammond, Lakewood, Calif., assignor to McCulloch Corporation, Los Angeles, Calif.

Filed Apr. 19, 1976, Ser. No. 678,133

Int. Cl.² B27B *17/02*

U.S. Cl. 30—382 1 Claim



1. In a chain saw including

chain saw engine means;

chain saw cutter chain means;

chain saw drive means operable to provide a driving connection between said chain saw engine means and said chain saw cutter chain means;

chain saw hand grip means having spaced apart first and second exterior surfaces positioned to be engaged by an operator's hand gripping the hand grip means; and

chain saw throttle actuator means positioned adjacent said first exterior surface to be engageable by a digit of an operator's hand gripping the hand means, said throttle actuator means biased toward a first, slow engine idle position and movable, in response to pressure from said operator's digit, to open-throttle positions;

the improvement comprising a safety interlock system for preventing movement of said throttle actuator means unless an operator's hand is properly gripping said chain saw grip means, said safety interlock system comprising a

pivotally mounted stop member on said chain saw, and biasing means that bias the stop member toward a first position in which an abutment portion thereof prevents movement of the throttle actuators means from its first, slow engine idle position and in which a release portion of said stop member protrudes through an opening in said second exterior surface of said chain saw hand grip means; said stop member being movable, in response to pressure exerted on said release portion by an operator's hand gripping the chain saw hand grip means, to a second position in which said abutment portion is moved away from its first position to permit abutment of said throttle actuator in response to pressure applied by said digit of an operator and in which its abutment portion is closer to the pivot axis of the throttle actuator means than when the stop member is in its first position, thereby facilitating a compact arrangement of said throttle actuator means and said safety interlock system;

said stop member further including integral hook means for holding said throttle actuator means in a fast idle positon that is displaced from its first, slow engine idle position, said hook means being engagable with said throttle actuator means in a third position of said stop member, said stop member further including a lever portion that is accessible to the chain saw operator when the stop member is in its second position, thereby enabling an operator to move said stop member to its third position said lever portion is located with respect to said hand grip means so as to be movable by another digit of the operator's hand that grips the hand grip means, thereby enabling a single hand of the operator to cause engagement of said throttle actuator means with said hook means.

4,028,805

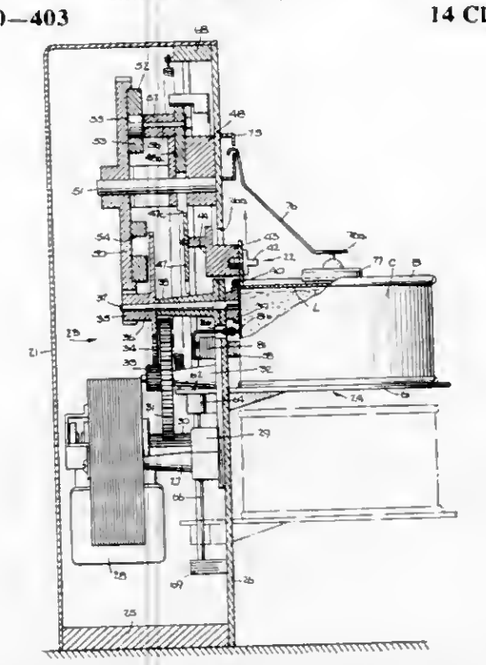
CAN OPENER

Anthony G. Figlia, Rego Park, N.Y., assignor to F. G. Walde, Inc., New York, N.Y.

Filed Aug. 30, 1976, Ser. No. 718,766

Int. Cl.² B67B *7/38*

U.S. Cl. 30—403 14 Claims



1. A can opener for use with hermetically sealed cans of foodstuffs and other materials, comprising a cutter blade mounted for reciprocal movement into and out of a cutting location, motor means for revolving a can to be opened when the same is disposed at said cutting location, power means operable conjointly with said motor means for sequentially reciprocally displacing said cutter blade so as to first force said cutter blade through the lid of said can concomitantly with the revolution thereof and, after the lid has been severed, then retract said cutter blade from said can to release the latter, and a platform structure for yieldingly supporting the opened can upon release thereof and for displacing it away from said cutting location while retaining it secure until removed by the user.

4,028,806

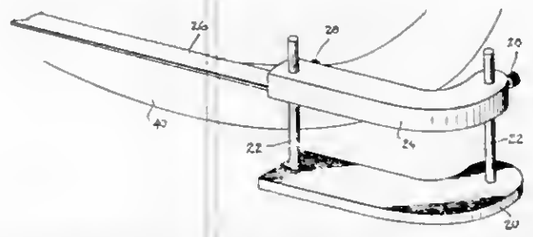
LAYERING KNIFE ASSEMBLY

Allen Sheldon, 1818 S. Barry Ave., Apt. No. 111, Los Angeles, Calif. 90025

Filed Feb. 20, 1976, Ser. No. 659,928

Int. Cl.² B26B *29/00*

U.S. Cl. 30—290 5 Claims



1. A knife assembly for slicing baked goods, fruits, vegetables and the like comprising:

a knife having a handle portion coupled to an elongated knife blade;

a base assembly, said base assembly having a bottom surface for resting on and sliding over a substantially flat work surface, said base assembly further having base slide means comprising a pair of cylindrical posts disposed in a parallel spaced apart disposition which are generally directed upward and perpendicular with respect to said bottom surface, said handle portion of said knife having handle slide means comprising a pair of holes through said handle for providing a slip fit on said cylindrical posts, said base slide means and said handle slide means being cooperative means to allow said knife to be slideably disposed on said base assembly with said knife blade substantially parallel to said bottom surface and at more than one elevation; and

means for locking said slide means and said handle slide means with respect to each other for disposing said knife blade at a selected elevation, wherein said knife assembly with said knife blade fixed at a particular elevation may be slid over work surface, thereby imparting a cutting motion to said knife blade.

4,028,807

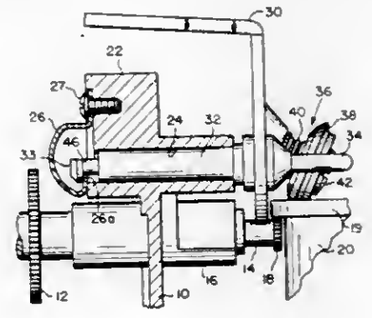
CAN OPENER LATCH FOR RELEASING CUTTING ASSEMBLY

Richard E. DeSisto, and Murray M. Mikituk, both of Welland, Canada, assignors to General Signal Corporation, Rochester, N.Y.

Filed Jan. 8, 1976, Ser. No. 647,389

Int. Cl.² B67B *7/38*

U.S. Cl. 30—419 16 Claims



1. In a can opener mechanism having a frame member, a drive wheel, a means for rotating said drive wheel and in combination therewith:

a. a hand lever carrying a cutting element and a shaft;

b. said shaft coupled to said hand lever at one end and having an undercut section proximate to the other end thereof;

c. a bore in said frame member for journaling said shaft;

d. a keeper intersecting a portion of said bore and supported for movement away from intersection with said bore in response to insertion of said shaft into said bore and then to return to intersection with said bore for engagement with said undercut section to inhibit axial removal of said shaft; and wherein

e. said shaft has a segment removed therefrom between said undercut section and said other end for enabling axial removal of said shaft only when said shaft is in a predetermined angular orientation such that the removed segment creates a condition of non-engagement between said keeper and said shaft.

4,028,808

CROZAT APPLIANCE AND METHOD OF MANUFACTURING SAME

Robert Schwartz, 1271 Westfield Ave., Rahway, N.J. 07065

Filed May 17, 1974, Ser. No. 470,732

Int. Cl.² A61C *7/00*

U.S. Cl. 32—14 E 5 Claims

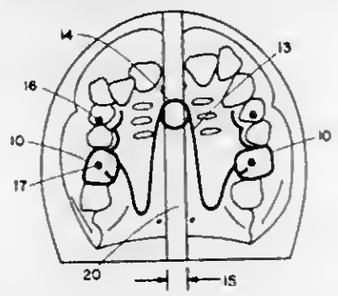
1. A method of fabricating a Crozat appliance useful in the treatment of dental malocclusion which comprises:

a. longitudinally sectioning a dental cast to form lateral cast halves;

b. restructuring said cast halves by locating said cast halves laterally of each other such that the cross-arch width distance between anatomical features of said cast halves

correspond substantially to the cross-arch width distance of an ideal arch structure; and

c. constructing a Crozat appliance in substantial conformance to said reconstructed cast comprising forming clasp means having anterior and interior portions to engage at least a portion of the outer periphery of a molar or



premolar on each side of the arch of said reconstructed cast and interconnecting the interior portions of said clasp means with a body wire, said body wire having an essentially flat spiral spring formed in a segment thereof and adapted to exert a spring extension force against said clasp means.

4,028,809

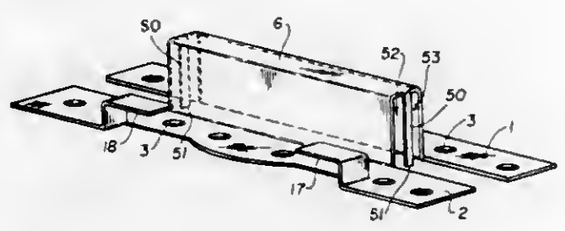
BUCCAL END TUBE

Melvin Wallshein, 8645 Bay Parkway, Brooklyn, N.Y. 11214

Continuation-in-part of Ser. No. 574,569, May 5, 1975, Pat. No. 3,988,831. This application Mar. 30, 1976, Ser. No. 672,012

Int. Cl.² A61C *7/00*

U.S. Cl. 32—14 A **18 Claims**



1. A buccal end tube device for selectively orienting an orthodontic arch wire relative to a tooth, the buccal end tube device being adapted for mounting to a buccal surface of the tooth, the device comprising: at least two arch wire positioning means spaced apart from each other in the axial direction of said buccal end tube, one of said arch wire positioning means defining at least one aperture and the other of said arch wire positioning means defining at least two apertures which are spaced apart from each other in the occlusal-gingival direction, said apertures being adapted to receive spaced portions of the arch wire, said other of said arch wire positioning means comprising a dividing tab member connected to said buccal end tube forming means and extending across said buccal end tube in a direction substantially perpendicular to the occlusal-gingival direction of said tube, said dividing tab member cooperating with said buccal end tube for defining at least two apertures spaced apart from each other in said occlusal-gingival direction, whereby the arch wire may be disposed in a predetermined orientation within an occlusal gingival plane by positioning the arch wire in selected apertures of said at least two spaced apart arch wire positioning means and maintained in the selected orientation against the action of external forces applied both to the arch wire and to the buccal end tube device.

4,028,810

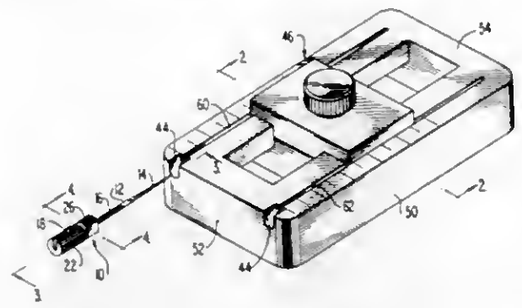
ROOT CANAL FILE

Bobby C. Vice, Augusta, Ga., assignor to Karl F. Klnkel, Augusta, Ga.

Filed Aug. 11, 1975, Ser. No. 603,470

Int. Cl.² A61C *5/02*

U.S. Cl. 32—57 **3 Claims**



1. An apparatus for determining the working length of a root canal file assembly of the type in which an elongated file has its shaft releasably mounted in a chuck of a handle assembly adapted to clamp the shaft in any desired position, said chuck including a nut threaded onto movable jaws of the handle assembly and operable to clamp and unclamp said shaft, the improvement wherein said apparatus comprises a body member, a measuring scale fixed on said body member, stop means mounted on said body member for movement along said scale, means releasably fixing said stop means in any desired position of adjustment along said scale, an elongated groove in said body and extending along said scale from said shoulder means, said groove being dimensioned to receive said root canal file therein, and jig means on said body for receiving said nut and cooperating therewith to prevent rotation thereof upon rotation of said handle assembly, said jig means including shoulder means for fixing the position of said nut relative to said scale and in alignment with said stop.

4,028,811

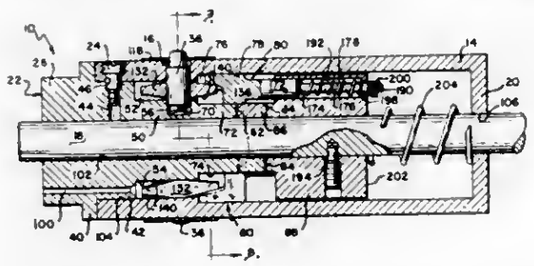
TUBULAR GAGE FOR A LIQUID-METAL-COOLED FAST BREEDER REACTOR

Ernest Hutter, Wilmette, and Leroy A. Tuma, Naperville, both of Ill., assignors to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed Mar. 2, 1976, Ser. No. 663,179

Int. Cl.² G01B *3/00*; **G21C** *17/00*; **G01B** *5/12*

U.S. Cl. 33—174 L **10 Claims**



1. A gage for measuring internal dimensions of a polygonal tube comprising:

a housing;

means cooperating with a female socket at one end of the polygonal tube to center the housing within the polygonal tube;

a rod moveable axially within the housing;

a plunger for each side of the polygonal tube disposed radially about the axial rod and extending through holes in the housing to contact the sides of the polygonal tube;

plunger springs disposed to urge the plungers outwardly against the sides of the polygonal tube;

a locking cam including an opening therethrough surrounding each plunger; and

means responsive to axial movement of the rod for tilting the locking cam to lock the plungers in any position against the action of the plunger springs.

4,028,812

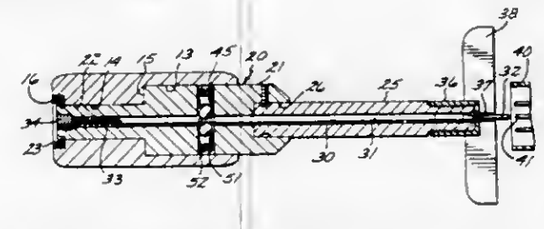
CONTACT RETENTION TEST TOOL

Russell F. Fleberg, 5431 Cerulean Ave., Garden Grove, Calif. 92645

Filed Jan. 21, 1976, Ser. No. 651,121

Int. Cl.² G01B *3/28*; **G01N** *3/14*

U.S. Cl. 33—169 B **8 Claims**



5. Apparatus for checking the insertion alignment of pins in a connector having peripheral edges, comprising:

a cylindrical probe;

handle means including a central bore for partly receiving said cylindrical probe on the interior thereof;

a peripheral groove formed around the exterior of said handle means;

a plurality of bores communicating between said groove and said central bore;

a peripheral ball seat formed on said probe in underlying proximity with said bores;

a corresponding plurality of balls received in said bores;

urging means disposed in said groove and bores for urging said balls against said probe; and

advancing means mounted in said handle for urging said probe out of said handle.

4,028,813

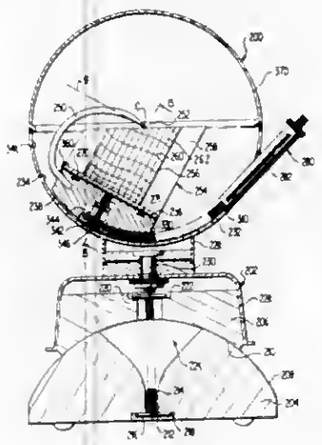
SUN COMPASS

Albert M. Eldridge, 4711 Chaperro Trail, Austin, Tex. 78731

Continuation-in-part of Ser. No. 577,176, May 14, 1975, abandoned. This application Oct. 22, 1975, Ser. No. 624,904

Int. Cl.² G04B *49/02*, *49/04*

U.S. Cl. 33—270 **16 Claims**



5. A manually portable sun-actuated instrument comprising:

a base including a hemispherical base member, said member presenting a hemispherical support surface;

a body including a curved bottom wall corresponding to the shape of said support surface and seated thereon;

a plate being mounted for movement on said body, said plate including a cylindrically curved face of fixed radius;

a plurality of generally parallel equally spaced time lines designating the hours of the day, said time lines being disposed on said face and extending generally longitudinally of the longitudinal axis of said face;

a gnomon connected to said body and having a tip substantially coinciding with the center of said hemispherical member and cylindrical a shadow on said cylindrical face dependent upon the hour angle and declination of the sun;

the tip of said gnomon casting a shadow which, upon falling on or between said time lines at a location corresponding to the time of day indicates that the longitudinal axis of said plate and the polar axis of the earth together define a plane extending essentially north and south through the earth;

first guide means, on one of said body and said plate and engaging the other thereof, for guiding said plate for movement in a first predetermined path along said body;

second guide means, on one of said body and said base member and engaging the other thereof, for guiding said body for movement in a second predetermined path on said hemispherical support surface;

first adjusting means manually accessible externally of said hemispherical base member and operatively connected to said body to shift said body along said second path to adjust the latitudinal position of said plate;

second adjusting means manually accessible externally of said hemispherical base member and operatively connected to shift said plate along said first path to adjust the longitudinal position of said plate;

a transparent hemispherical top rotatably mounted on said hemispherical base member, said transparent top having an arc line which bisects said top, the ends of which arc intersect a 360 degree indicia scale situated around the upper edge of said hemispherical base member at points spaced 180° apart.

12. A manually portable sun-actuated instrument comprising:

a body;

a cylindrical plate mounted on said body, said plate including a pair of cylindrical, mutually spaced inner and outer walls formed of transparent material and defining a chamber therebetween;

said chamber being partially filled with a quantity of opaque, essentially cling-free liquid;

a plurality of time lines designating the hours of the day, said time lines being disposed on one of said walls; and

a gnomon connected to said body and having a tip substantially coinciding with the center of said cylindrical plate and casting a shadow on said cylindrical plate dependent upon the hour angle and declination of the sun;

the tip of said gnomon casting a shadow which, upon falling on or between said time lines at a location corresponding to the time of day indicates that the longitudinal axis of said plate and the polar axis of the earth together define a plane extending essentially north and south through the earth.

PIVOTING RULE

Peter Andrews, 190 Gebhardt Road, Penfield, N.Y. 14526

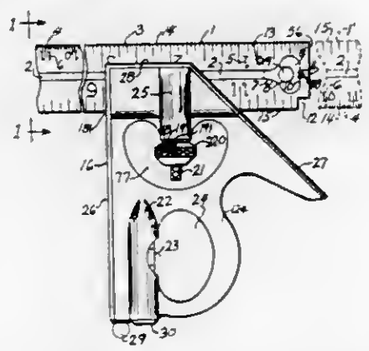
Continuation-in-part of Ser. No. 13,015, Feb. 20, 1970, abandoned, which is a continuation-in-part of Ser. No. 699,199, Jan. 19, 1968, Pat. No. 3,510,950, which is a continuation-in-part of Ser. No. 167,609, Jan. 24, 1962, Pat. No. 3,364,581. This application June 28, 1971, Ser. No. 157,774

Int. Cl.² B43L *7/06*

U.S. Cl. 33—94 **15 Claims**

1. A rule member for a subcombination head means of a combination tool means, comprising: an elongated graduated and groove rule member having graduations and corresponding indicia along at least one longitudinal face edge portion

thereof; said member having a longitudinally extending groove in at least one face edge portion thereof and an enlarged opening is provided in at least one said face edge portion of said member and having said groove terminating into said opening for forming an enlarged dead-end portion of said groove terminating a short-distance from an outer edge portion of said member while a second end of said groove having an open-end and substantially exiting through one portion of a second end edge portion of said member wherein a second enlarged opening is provided in at least one face edge portion of said member and being spaced a short-distance from said second end edge portion of said member and having said groove leading substantially into and out of said second opening for forming a short groove on one side of said second opening; said member is so constructed that when at least one portion of a nib means of a grooved rule releasably clamping means is slidingly engaged in at least one portion of said



groove for being, in one operation, either substantially slidingly engaged in said dead-end portion of said groove for allowing said member to be substantially pivoted 180° substantially on said nib means and substantially in said head means for presenting a different set of said graduations and said indicia to at least one side edge portion of said head means or be slidingly slipped substantially through said second end edge portion of said member and out of said open-end of said groove for slidingly disconnecting said head means substantially along an axial length of said groove and from said member and without disassembling any portion of said rule releasably clamping means for releasably clamping said member substantially to said head means and said member can be substantially pivoted 180° on either end thereof by use of said enlarged openings and when said nib means is engaged therein and which nib means may also be slidingly slipped out through said short groove for disconnecting said member from said head means.

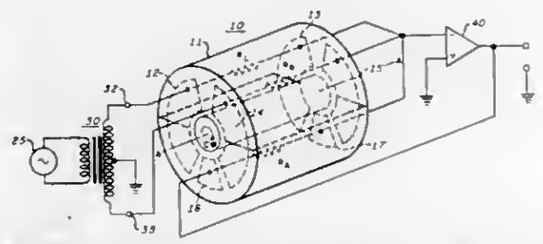
TEMPERATURE COMPENSATED TOROIDAL ACCELEROMETER

Charles G. Buckley, Phoenix, Ariz.; Ghanshyam A. Bhat, Matawan, N.J., and Harold L. Swartz, Glendale, Ariz., assignors to Sperry Rand Corporation, New York, N.Y.

Filed Nov. 18, 1974, Ser. No. 524,594

Int. Cl.² G01C *9/06*

U.S. Cl. 33—366 **13 Claims**



1. An electrical tilt sensor of the liquid level type having a normal tilt range comprising

non-conductive housing means defining a closed chamber of generally annular, symmetrical internal configuration about a reference axis corresponding to the horizontal axis of the sensor,

first and second electrode means fixed in said housing means and oppositely disposed with respect to each other about said axis,

third electrode means fixed between said first and second electrodes within said housing means,

fourth electrode means fixed in said housing means having corresponding portions equidistant from said first, second and third electrode means respectively,

electrolytic fluid means having volumetric and impedance characteristics which vary with ambient temperature, partially filling said chamber, partially immersing said first, second and said corresponding portions of said fourth electrode means, and completely immersing said third electrode means and said corresponding portion of said fourth electrode means for the normal tilt range of the sensor, and

circuit means coupled to said first, second, third and fourth electrode means respectively for providing an output signal proportional to the tilt of said sensor about said reference axis in accordance with the relationship:

$$\theta = R_A \left(\frac{1}{R_L} - \frac{1}{R_R} \right)$$

θ is the tilt angle,

R_L is the electrolyte resistance between said first and fourth electrode means,

R_R is the electrolyte resistance between said second and fourth electrode means, and

R_A is the electrolyte resistance between said third and fourth electrode means,

whereby said output signal is compensated for variations in volume and impedance of said electrolytic fluid means produced by changes in temperature.

4,028,816

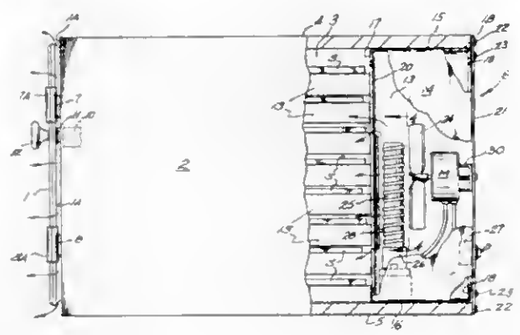
FOOD DRYER

Frank D. Macy, 420 S. Holly, Canby, Oreg. 97013; Harold E. Hawthorne, 401 N. James, and Harold L. Norton, Rte. 1, Box 291B, both of Silverton, Oreg. 97381

Filed Dec. 12, 1975, Ser. No. 640,178

Int. Cl.² F26B *11/18*

U.S. Cl. 34—195 **5 Claims**



1. A food dryer comprising in combination,

a dryer cabinet,

a door supported by the front end of said cabinet,

means mounting the door to said front end of said cabinet in a uniformly offset manner to provide an exhaust passageway extending about the door edges, and

a noncombustible housing module fully occupying the rearward end of said cabinet, said housing adapted to mount electrical components including a fan and motor of the dryer in a manner isolating said components from the cabinet, said housing having a reticulated closure at its forward end.

4,028,817

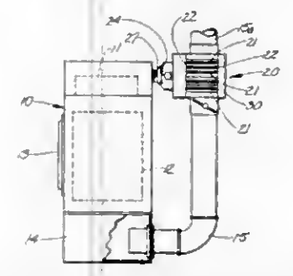
APPARATUS FOR RECOVERY OF HEAT FROM EXHAUST GASES OF DRYER

Frank H. Winstel, Newtown, Ohio, assignor to Auto-Heat, Inc., Cincinnati, Ohio

Filed Sept. 29, 1975, Ser. No. 617,747

Int. Cl.² F26B *19/00*

U.S. Cl. 34—86 **1 Claim**



1. Apparatus for recovery of heat in a laundry dryer having a heat chamber means, a drying chamber, a lint removal chamber, and an exhaust conduit, comprising:

heat exchange means positioned in said exhaust conduit, said heat exchange means including a plurality of tubes open to a source of fresh air at one end thereof, means securing said tubes in spaced apart, substantially parallel staggered relation transverse to flow of heated exhaust gases through said exhaust conduit and preventing escape of said exhaust gases from said exhaust conduit, a helically twisted elongated strip inside each said tube;

suction fan means adjacent the other ends of said plurality of tubes to draw fresh air through said tubes, said fresh air being heated in transit by said exhaust gases;

plenum means surrounding said fan means and communicating with said other ends of said tubes for receiving said fresh air drawn therethrough while preventing intermingling of said exhaust gases therewith;

conduit means communicating with said plenum means for conducting said heated fresh air into said heat chamber means or into said drying chamber of said dryer;

first damper means in said exhaust conduit regulating the flow of exhaust gases therethrough; and

second damper means in said conduit means regulating the flow of heated fresh air therethrough.

4,028,818

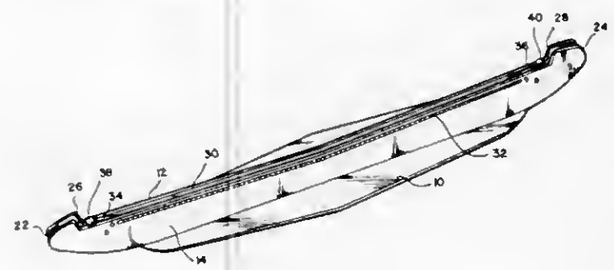
TRACKED INCLINE TEACHING APPARATUS

H. Burt Warner, 1713 S. Walnut Leaf Drive, Walnut, Calif. 91789, and Earl Cameron Kruger, Jr., 5601 Sorrento Drive, Long Beach, Calif. 90803

Filed Oct. 29, 1976, Ser. No. 736,915

Int. Cl.² G09B *23/10*

U.S. Cl. 35—19 R **12 Claims**



1. A tracked incline teaching apparatus for illustrating the laws of physics by facilitating the observation of movement of balls on an incline, comprising: a pair of spaced apart members defining a track for said balls in the shape of two declivities of equal length, slanting toward each other at symmetrical angles of inclination with respect to a horizontal plane, and a center portion smoothly joining said declivities, a detent disposed on each of the opposite ends of said track and movable between a first, ball-retaining position and a second position for release of balls placed thereon for movement of said balls along said track in the direction toward each other, and trigger means for synchronously simultaneously moving said detents from said first to said second position.

4,028,819

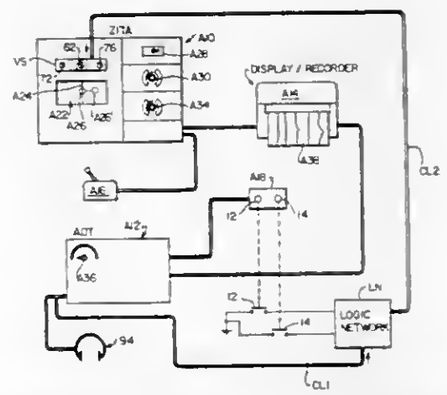
METHOD FOR MEASURING TASKS AND MEANS FOR GENERATING COORDINATED AUDIO-VISUAL STIMULI AND ERROR INDICIA FOR SAID SECONDARY TASKS

Norman K. Walker, 6613 Sulky Lane, Rockville, Md. 20852

Filed July 12, 1974, Ser. No. 488,072

Int. Cl.² G09B *19/00*

U.S. Cl. 35—22 R **11 Claims**



1. Means for generating multiple modes of command stimuli for dictating performance of specific tasks and monitoring the correctness of responses thereto, comprising:

clock pulse generating and timing means providing clock pulses and timing signals at regular predetermined intervals;

random stimuli selection signal generating means enabled by said timing signals from said timing means to provide first and second stimuli selection signals at regular intervals and in random sequence;

first and second signal generating means providing first and second audio output frequencies, respectively;

gate means having inputs driven by said timing means, said first and second audio outputs and said first and second random stimuli selection signals and selectively enabled thereby to pass said first and second audio outputs in random sequence at regular intervals;

audio output means in circuit with said gate means driven by and providing first and second discernible tones in response to said audio output frequencies;

first and second light emitting means in circuit with said random stimuli selection signal generating means energized, respectively, by said first and second stimuli selection signals and in synchronous correlation, respectively, with said first and second discernible tones to produce first and second visual stimuli such that related ones of said tones and said visual stimuli provide a dual command stimulus for a given task to be performed;

response means comprising first and second input devices to be actuated in response to and in correlation with said first and second discernible tones and/or said first and second visual stimuli;

detector circuit means enabled by said timing means and responsive to the actuation of said first and second input

devices to provide first and second response signals, respectively;

error detecting gate means having respective inputs enabled by said clock pulse means, said first and second random selection signals and said first and second response signals providing an error output in response to errors comprising a lack of actuation of either of said input devices within said regular predetermined interval between said clock pulses and said tones and/or visual stimuli and in response to actuation of said input devices out of correlation with said tones and/or visual stimuli; and

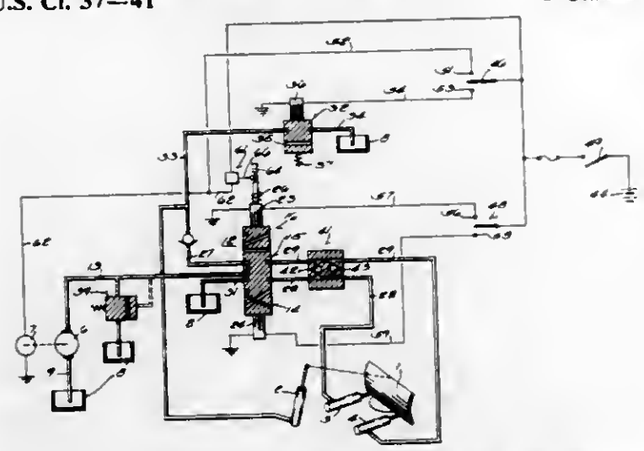
indicating means responsive to said error output to indicate the occurrence of a said error.

4,028,820

HYDRAULIC SVSTEM FOR VEHICLE MOUNTED SNOWPLOW BLADE

George D. Simonds, Jr., Mequon, Wis., assignor to Douglas Dynamics Corporation, Milwaukee, Wis.

Filed Dec. 31, 1975, Ser. No. 645,512
Int. Cl.² E01H 5/00; E02F 3/76
U.S. Cl. 37—41 **3 Claims**



1. A hydraulic system for selectively raising, lowering, and angling a snowplow blade and comprising, in combination,

lift means in the form of a first single acting hydraulic cylinder,

angle means in the form of second and third single acting hydraulic cylinders,

a pump,

hydraulic fluid reservoir,

conduit means connecting said pump, reservoir, lift means and angle means for transferring fluid between said reservoir and said lift and angle means,

a single valve connected in said conduit means and controlling power fluid flow from said reservoir to said lift means and angle means,

said valve having a plurality of operative states, a first operative state connecting said pump to said lift means and being movable from said first state to connect said pump to said angle means,

actuating means connected to said valve for manipulating said valve to achieve a selective one of said operating states,

valve means separate from said single valve,

conduit means defining a flow from said lift cylinder through said valve means to said reservoir separate from said single valve,

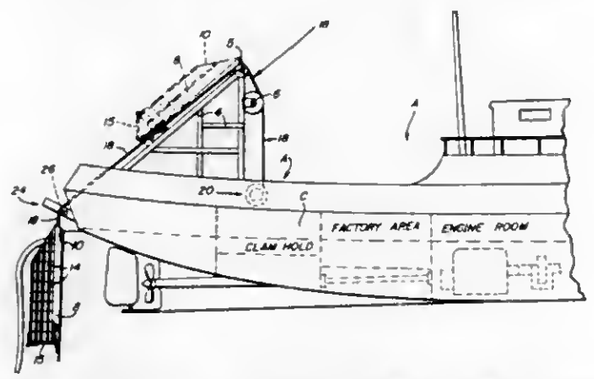
and actuating means for said valve means selectively operable to close said valve means and interrupt flow to said reservoir and open said valve means to permit flow to said reservoir.

4,028,821

APPARATUS FOR DREDGING FROM THE STERN OF MARINE VESSELS

Fletcher Hanks, Hanks Seafood Co., Inc., P.O. Box 70, Easton, Md. 21601

Continuation-in-part of Ser. No. 442,604, Feb. 14, 1974, abandoned. This application July 1, 1975, Ser. No. 592,224
Int. Cl.² E02F 5/00
U.S. Cl. 37—55 **9 Claims**



1. The combination with a marine vessel having a bow-wise inclined ramp mounted adjacent its stern, of a scoop-type dredge for shell fish etc.,

said dredge comprising a generally rectangular water-pervious cage having a leading open end for scooping-up shell fish etc.,

a gate mounted at the trailing end of said cage and adapted for free swinging movement about a horizontal axis from a pivotal connection with said cage,

a pair of substantially spaced and transversely parallel cable receiving blocks attached to said cage adjacent its leading end

a reciprocable support mounted on said vessel and, disposed beneath said ramp

said support including a pair of rigidly connected, Y-shaped elements with their diverging members extending sternwise and upwardly inclined with respect to said vessel

a sheave mounted at the intersection of the, diverging members of each of said rigidly connected Y-shaped elements

a fluid cylinder mounted on said vessel to extend, fore-and-aft with the outer end of its piston rod operatively connected to said support

a winch, mounted on said vessel

a cable having both of its ends secured to said winch

said cable defining a loop which extends through the cable receiving blocks adjacent the leading end of the aforementioned cage and,

means mounted on said vessel for guiding the intermediate portions of said cable between said winch and the aforementioned blocks on said cage.

4,028,822

MANUALLY OPERABLE DEPTH CONTROL FOR TRENCHERS

Ted L. Teach, Dayton, Ohio, assignor to Laserplane Corporation, Dayton, Ohio

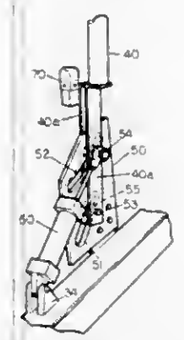
Filed Apr. 20, 1976, Ser. No. 678,694
Int. Cl.² E02F 5/06; B27G 23/00
U.S. Cl. 37—86 **5 Claims**

1. In a trencher of the type having an elongated digging frame having one end thereof pivotally mounted on a vehicle for movement in a vertical plane parallel to the path of movement of the vehicle, said digging frame having two spaced sprockets traversed by an endless chain carrying a plurality of spaced digging scoops, means on the vehicle for driving the forward sprocket and power means on the vehicle for varying the pivotal angle of said digging frame relative to the horizontal, thereby determining the depth of the trench being dug by said blades, the improvement comprising:

1. stationary sighting bar means disposed along the path of travel of the vehicle, said means defining a visual plane of known height relative to the desired depth of the trench to be dug;

2. an upstanding mast having its bottom end pivotally mounted on said digging frame adjacent the free end thereof for movement in a vertical plane;

3. means for maintaining said mast in a true vertical position irrespective of the angular position of said digging frame,



said last mentioned means concurrently effecting a change in the effective height of said mast as a trigonometric function of the angle of said digging frame relative to the true horizontal and,

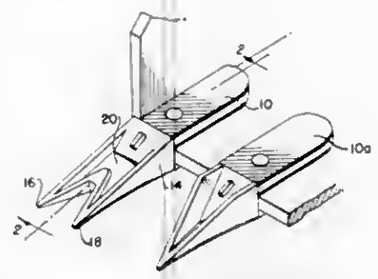
4. a horizontal sighting bar vertically adjustably mounted on said mast to permit said bar to be visually aligned with said stationary sighting bar means when said digging frame is initially forced into the ground to the desired starting depth for the trench to be dug.

4,028,823

DIGGING TOOTH

Gerald D. Edwards, Rte. 1, Box 15a, Dubberly, La. 71024, and Floyd B. Edwards, Rte. 3, Box 436, Canton, N.C. 28716

Filed Oct. 31, 1975, Ser. No. 627,686
Int. Cl.² E02F 9/28
U.S. Cl. 37—142 R **3 Claims**



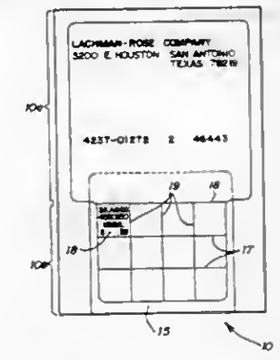
1. A tooth for a power digger having a socket to receive a shank mounted on a digging bucket or the like comprising a rearward portion in which the socket is formed and a forward portion, a top, a bottom and two side surfaces, said top surface sloping downwardly to meet said bottom surface at the forward end of said forward portion, said forward portion comprising two elongated forwardly extending points separated by a cleft, the outer sides of said tooth points being substantially parallel. Said top surface being also formed with a depression extending across said rearward portion and having a portion of said depression extending forwardly in the top surfaces of said elongated points whereby the tooth presents a generally W form when viewed from a position toward which it is moved when in use.

4,028,824

MAILING-PRICE LABEL

Harold R. Miller, Ferris, Tex., assignor to Data Documents, Inc., Dallas, Tex.

Filed Oct. 18, 1976, Ser. No. 733,165
Int. Cl.² A44C 3/00
U.S. Cl. 40—2 R **6 Claims**



1. A mailing-price tag label which comprises:

a blank of two adjacent substantially rectangular areas one of which is of width greater than the second so as to extend beyond opposed edges of the second area, said blank having an adhesive coated back surface,

a peelable backing paper overlaying and protecting said adhesive coated back surface, and

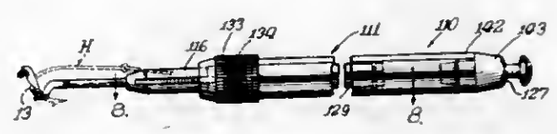
said backing paper being cut into two sections and with one section overlaying the second area of the blank and extending into the section overlaying the first area for removal from the back paper from the first area independently of removal from said first area.

4,028,825

FISH HOOK REMOVER

Siegfried K. Tetzner, 5307 W. Lake Shore Drive, Wonder Lake, Ill. 60097

Filed July 18, 1975, Ser. No. 597,040
Int. Cl.² A01K 97/00
U.S. Cl. 43—53.5 **14 Claims**



1. A tool for removing from a fish a barbed hook attached to line, comprising: means defining a handle portion; and a generally helical extractor portion extending axially forwardly from one end of said handle, said extractor portion having a forward helical surface defining a distal end and a forwardly opening notch intetrally formed in said extractor portion surface adjacent said distal end for receiving the bight of a hook being removed from a fish, said notch being defined by a helically rearward stop surface extending generally parallel to the axis of the extractor portion and a forward guide surface extending at a small angle to the helical extent of the extractor portion forward helical surface for guiding the hook bight into abutment with said stop surface as an incident of manipulation of the handle rotatively about said axis with the extractor portion urged forwardly against the bight and coaxially of the shank of the hook being removed from the fish.

2. A tool for removing from a fish a barbed hook attached to a line, comprising: means defining a handle portion; and a generally helical extrator portion extending axially forwardly from one end of said handle, said extractor portion having a forward helical surface defining a distal end and a forwardly opening notch integrally forced in said extractor portion surface adjacent said distal end for receiving the bigbt of a hook

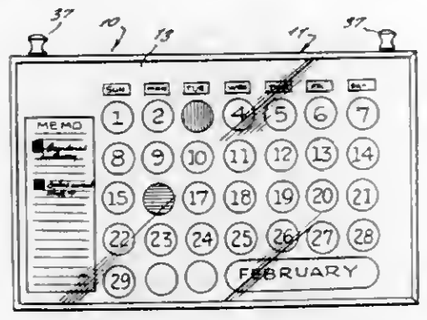
being removed from a fish and at least one additional notch in said extractor portion surface helically from said first named notch.

4,028,826

PERPETUAL MEMORY BANK CALENDAR

Angelo Brandifino, and Frances Brandifino, both of 10 Sheridan St., Huntington, N.Y. 11743

Filed Mar. 15, 1976, Ser. No. 666,863
Int. Cl.² G09D *3/00*
U.S. Cl. 40—110 **1 Claim**



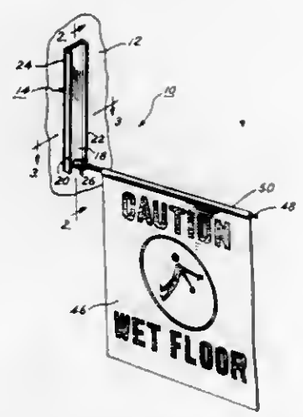
1. A perpetual memory bank calendar, comprising in combination, a case consisting of a frame fitted with front window and rear panel enclosing a central chamber containing removable six month cards each having a name of a different month imprinted on each side thereof, said month card sides being selectively placable in said chamber to face said window, wherein each said month card side additionally includes imprinted thereupon the numerical dates of said month, arranged in rows, each said month card side additionally includes a memorandum space for being written upon by an erasable marker, a surface of each said month card side being glazed, wherein a mechanism inside said case includes an endless belt having names of the days of a week imprinted thereupon, said belt being movable for alignment of said day names respective to said numerical dates on said month card sides wherein different colored stickers of self adhesive type are mounted upon said month card sides and corresponding to stickers on said memorandum space and over said numerical dates.

4,028,827

SIGN

Austen B. Hufton, Glen Ellyn, Ill., assignor to Servicemaster Industries Inc., Downers Grove, Ill.

Filed Jan. 15, 1976, Ser. No. 649,270
Int. Cl.² G09F *7/22*
U.S. Cl. 40—128 **3 Claims**



1. An improved warning sign which may be quickly and easily mounted on and dismounted from a metal doorframe or the like in an institutional building, such as a hospital, for the purpose of alerting persons to temporary, potential hazards relating to maintenance work and the like begin done in the vicinity, the improved warning sign comprising:

a base member having first and second, parallel, generally rectangular surfaces which are substantially flat and which are disposed back to back to each other and having integral, longitudinal, lateral edges which are disposed substantially perpendicular to the planes of the first and second surfaces and which project from the plane of the second surface, the first surface being adapted to face the metal doorframe and the second surface being adapted to face away from the metal doorframe when the sign is mounted on the metal doorframe;

means for mounting the base member on the metal doorframe, the mounting means including a magnet which is secured to the first surface of the base member and which has a size and shape so that the magnet overlies substantially all of the first surface and so that when the first surface faces the metal doorframe, the magnet is adjacent to and in contact with the metal doorframe;

an elongated, telescopable rod which has a first end and a second end and which is constructed so that its second end may be selectively moved longitudinally with respect to its first end so as to permit the length of the elongated, telescopable rod to be varied;

a rod end holder integrally formed as a part of the base member, adjacent to one end of the base member, for selectivity receiving and holding the first end of the elongated, telescopable rod so that when the first end of the elongated, telescopable rod is being held by the rod end holder, the elongated, telescopable rod extends and projects from the second surface of the base member at a preselected, acute angle with respect to the second surface of the base member;

a piece of material having a cautionary warning message thereon; and

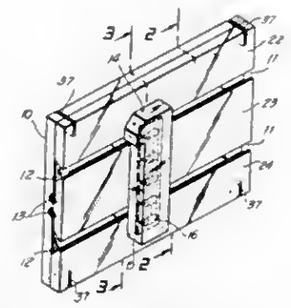
means for selectivity mounting the piece of material on the elongated, telescopable rod at a point between the first and second ends of the elongated, telescopable rod.

4,028,828

LIGHTING DISPLAY SYSTEM

Albert Chao, and Ethel Chao, both of 407 Glendale Road, Northvale, N.J. 07647

Filed Apr. 2, 1976, Ser. No. 673,307
Int. Cl.² G09F *13/00*
U.S. Cl. 40—130 D **2 Claims**



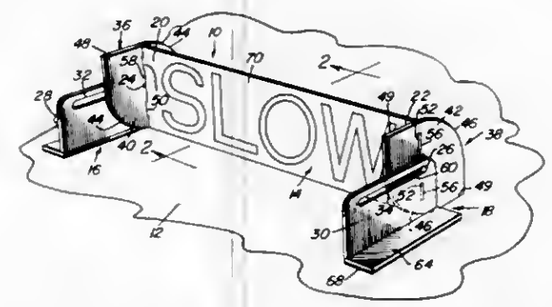
1. A lighting display system comprising; a display board to be supported on a wall, desk, or other surface; and a set of letters, numerals, or other characters to be secured to said display board for illumination; said characters comprise a hollow molded translucent top and a flat base of matching configuration having a printed circuit on the top surface thereof; illumination means comprising miniature light bulbs mounted on said top surface of said flat base; said display board having two channels running longitudinally across the surface thereof, conductive strips at the base of each channel and running the length of said channels; said conductive strips attached to sockets at each end of the display board; said sockets thereof are used for connection to an electrical supply or for connecting successive display boards to each other conductive extensions on the rear surface of said base character of a shape complementary to the shape of said channels; said extensions fitting securely in said channels and making adequate electrical connection with said conductive strips in said channels, connecting pins for carrying power from one display board to the next; said connecting pins are conductive and fit into said sockets on adjoining lateral edges of connecting display boards; said connecting pins being removable when unnecessary; clips to strengthen the joint of adjoining boards and slots provided across the top and bottom edges at each end of the display boards; said clips are attached to the adjoining display boards at the top joints and have extensions which fit into said slots on the top and bottom edge of each display board to provide lateral and vertical support to the joint.

4,028,829

WARNING DEVICE FOR VEHICLES

Michael F. Murray, 189 Cedar Ave., Oroville, Calif. 95965

Filed May 5, 1975, Ser. No. 574,322
Int. Cl.² G09F *7/00*
U.S. Cl. 40—129 C **8 Claims**



1. An inertia-actuated warning signal device for vehicles, comprising, in combination:

a. an inertia member; and

b. support means arranged on a vehicle for mounting the inertia member for limited reciprocating movement in a path extending along a direction of motion of the vehicle during deceleration and acceleration of the vehicle, and for rotating movement about the path of movement simultaneously with movement along the path of movement, and the inertia member is a longitudinally extending planar member having longitudinally spaced ends, and trunnions extending coaxially in opposite directions from the spaced ends, and the support means includes a pair of spaced, substantially parallel, upstanding panels, each of the panels provided with a longitudinal support slot arranged substantially parallel to each other and extending parallel to the direction of movement of the vehicle, the trunnions being disposed in the slots for sliding movement therein.

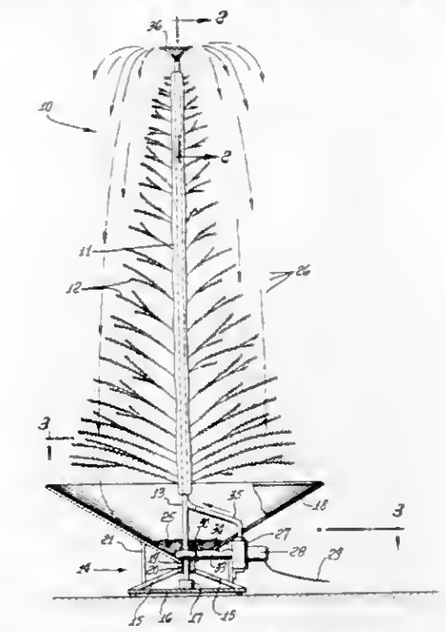
4,028,830

SNOWING FIXTURE

Dwight M. Ottinger, 1777 Wren St., Corona, Calif. 91720

Filed Apr. 5, 1973, Ser. No. 348,006
Int. Cl.² G09F *19/02*
U.S. Cl. 40—106.25 **7 Claims**

1. A fixture for simulating falling snow particles comprising a reservoir of individual simulated snow particles forming a catch basin with a wall structure sloping laterally inwardly toward a lowermost area, said particles being in quantity forming a mass in said catch basin with a constantly present upper surface above said lowermost area, a pump, a motor having an operating connection to the pump, a distributor conduit connected to the outlet side of the pump, said distributor conduit having constantly open particle outlet means at a fixed location elevated relative to a supporting surface and substantially in vertical alignment with said catch basin, a pump intake conduit of substantially uniform size having a particle inlet means emersed in said mass at a location adjacent said lowermost area of the catch basin and below said upper surface, and a constantly open pure air intake of fixed



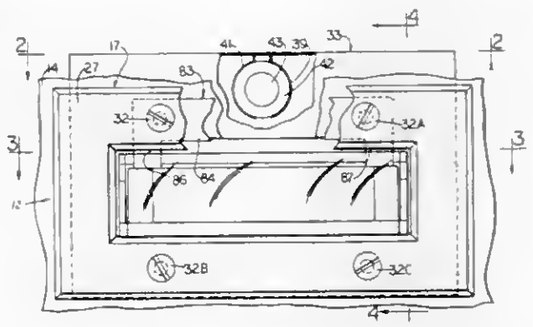
size in said intake conduit intermediate said particle inlet means and the pump, said air intake having a fixed position exteriorly with respect to said catch basin and below said upper surface, said pure air intake is a port exceeding the particle inlet means in size and is located at a level below said upper surface of the mass of particles and at substantially the same level as said particle inlet means.

4,028,831

SERVICE INDICATING DEVICE

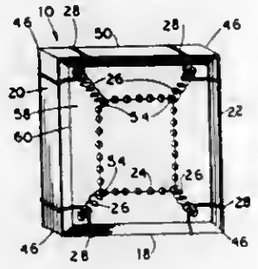
Asger K. Hahne, 160 Broadway, Batavia, Ohio 45103

Filed Oct. 9, 1975, Ser. No. 621,038
Int. Cl.² G09F *13/18*
U.S. Cl. 40—130 K **3 Claims**



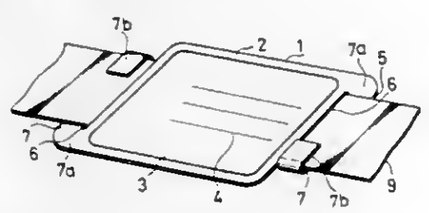
1. A service indicating device which includes a casing, a drawer slidably received in the casing, said drawer having a transparent front panel, a plurality of indicator element blocks of translucent material mounted in the drawer tandemwise with a front face of one of the indicator element blocks adjacent the front panel of the drawer, indicia on front faces of the indicator element blocks for viewing through the front panel of the drawer, and a lamp mounted above the drawer and arranged to illuminate the one of the indicator element blocks having its face adjacent the front panel of the drawer.

4,028,832
CORNER HOOK FRAME
Celia Wu, 295 W. 11th St., New York, N.Y. 10014
Filed May 24, 1976, Ser. No. 689,500
Int. Cl.² G09F 1/12
U.S. Cl. 40—155 3 Claims



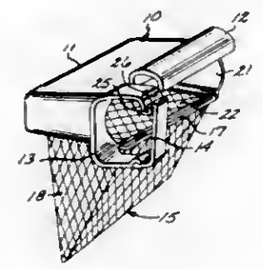
1. A corner hook frame assembly for detachably securing a picture to a panel member, which comprises:
a. a plurality of hook shaped anchoring members, each said anchoring member including a pair of legs adapted to be removably secured onto one corner of a combination of said panel and said picture, each said anchoring member including a large V-shaped section having a common juncture between said legs, an intermediate section integrally joined at an obtuse angle to an outer free end of each said leg, an L-shaped section perpendicularly joined to an outer free end of each said intermediate section, and a hook shaped section integrally joined to each said juncture of each said V-shaped section;
b. a plurality of spring members, one said spring member detachably secured to one said hook shaped section of one of said anchoring members; and
c. a closed loop member, said closed looped member removably communicating with each said spring member causing a tension to be placed on each said spring member.

4,028,833
METALLIC TAG
Chiharu Kai, No. 3-4, 2-chome, Kita, Koenji, Shuginami, Tokyo, Japan
Filed June 2, 1975, Ser. No. 582,824
Int. Cl.² G09F 3/00
U.S. Cl. 40—316 1 Claim



1. A metallic tag for fitting around a binding, said tag comprising:
a thin, bendable, rectangular metal plate having two spaced, parallel, straight cutout slots therein extending from one edge of said plate partially thereacross, said binding fitting through said slots, and said plate further having bendable edge strips formed between said slots and the edges of said plate adjacent said slots adapted to bend over against said binding fitted through said slots, whereby said plate is secured to said binding; and
inscription portion means on said metal plate between said parallel slots for inscribing information thereon.

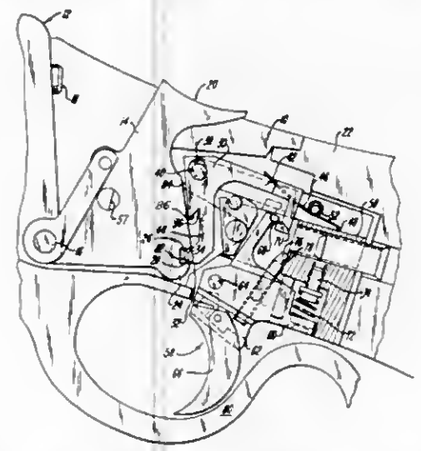
4,028,834
SPENT CARTRIDGE COLLECTOR
Allan E. Dobson, 4653 Beverly Blvd., Los Angeles, Calif. 90004
Filed Feb. 26, 1976, Ser. No. 661,442
Int. Cl.² F41C 27/00
U.S. Cl. 42—1 T 5 Claims



1. In combination with a firearm that has an ejection port from which spent cartridge shells are discharged, an apparatus for collecting spent cartridge shells ejected from said ejection port, said apparatus comprising:
a. hollow enclosure defining means formed from a thin wall sheet material, said hollow enclosure defining means having an upper surface, a lateral surface and a bottom surface, a first opening in said lateral surface that surrounds said ejection port, a second opening in said bottom surface, and two opposed grooves formed on the exterior of said bottom surface and disposed along two opposed edges of said second opening;
b. hanger means attached to said hollow enclosure defining means adjacent said first opening, said hanger means extending away from said hollow enclosure defining means along a plane substantially coincident with said upper surface, said hanger means so removably engaging said firearm that said hollow enclosure defining means is removably supporting from said firearm with said first opening in alignment with said ejection port;
c. receptacle means releasably secured to said hollow enclosure defining means in a position below said second opening for collecting said spent cartridge shells therein, said receptacle means including projections formed thereon for slidable receipt within said grooves, and said receptacle means comprising a rectangular frame having two first opposed segments that define projections for receipt in said grooves, a wire cage extending from said frame, and a wire mesh wrapping surrounding said cage; and
d. securing means attached to said hollow enclosure defining means for attachment of the latter to said firearm.

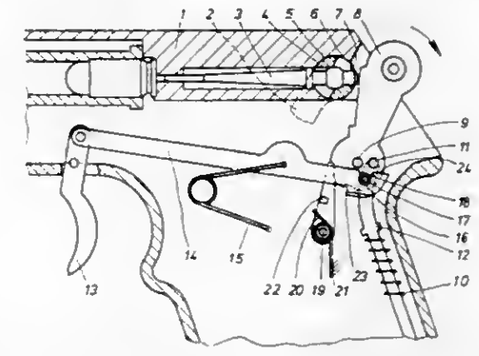
4,028,835
TRIGGER MECHANISM FOR RIFLES
Mathew H. Canjar, Denver, Colo., assignor to M.H. Canjar Company, Denver, Colo.
Filed Aug. 8, 1975, Ser. No. 603,128
Int. Cl.² F41C 19/00
U.S. Cl. 42—69 R 4 Claims

1. For use with a rifle action of the type having a trigger mechanism; a firing pin; a hammer mounted for pivotal movement from a cocked position forwardly through a half-cocked position into a fired position against said firing pin, said hammer including a tooth projecting rearwardly from the rear edge thereof and means defining an upwardly-facing ledge above said tooth; and, spring means biasing said hammer forwardly into its fired position, said trigger mechanism comprising: a pivot pin positioned behind the hammer; a sear loosely mounted on said pivot pin for relative movement rearwardly thereof and for pivotal movement from a retracted inoperative position forwardly into either of two extended operative positions, said sear including a forwardly-extending projection positioned and adapted in the first of its forwardly-extended operative positions to engage the upwardly-facing ledge of the hammer and releasably latch the latter in its cocked position, said sear having a forwardly-opening notch positioned and adapted in the second of its forwardly-extended operative positions to receive the tooth of the hammer when in its half-cocked position and prevent the latter from engaging the firing pin, said sear when in its first extended position having a first cam surface in sliding engagement with the tooth of the hammer as the latter moves from its cocked position toward its fired position, and said sear including a second cam surface located beneath the notch therein positioned for engagement by the hammer tooth upon movement of the hammer from extended into retracted position; a sear return spring connectable to the sear for normally biasing it into one of its extended positions; a trigger mountable for pivotal movement from a released position rearwardly into a triggered position, said trigger being positioned and adapted in its released position to engage the sear in its first extended operative position and prevent retraction thereof, said trigger being operative upon actuation thereof from its released position into its triggered position to disengage said sear for movement from its first extended operative position into its second extended or retracted positions, and said trigger being inoperative in either its released position or its triggered position to retract said sear in the second extended operative position thereof; and, means comprising a trigger spring connectable to the trigger for normally biasing it into its released position, said first cam surface being shaped to coact with the hammer tooth as the latter slides forwardly therealong under the unrestrained bias of the hammer spring to retract said sear far enough and for an interval long enough to permit said hammer tooth to by-pass the notch in said sear before the sear return spring can return said sear to either of its extended positions upon actuation of the trigger with said sear in its first extended operative position, and said second cam surface and hammer tooth coacting upon movement of the hammer from extended into retracted position to move said sear rearwardly relative to its pivot pin into a position where it will by-pass the trigger in triggered position.

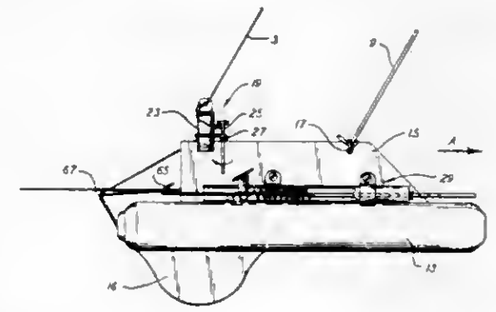


4,028,836
COCKING MECHANISM FOR HAND FIREARMS
Dieter Keppeler, Langenau, Germany, assignor to Carl Walther, Sportwaffenfabrik, Ulm (Danube), Germany
Filed Apr. 7, 1976, Ser. No. 674,624
Claims priority, application Germany, Apr. 17, 1975, 2517002
Int. Cl.² F41C 19/14
U.S. Cl. 42—69 B 1 Claim

1. In a cocking mechanism for small firearms, the combination of a pivotally mounted hammer engageable with a firing pin and having a roller thereon, a trigger rod pivotally connected to a trigger and having a notch engagable by said hammer roller, spring means acting upon said trigger rod to urge said notch into temporary engagement with said roller during cocking of the hammer said trigger rod having a surface and said notch is in said surface, and a laterally projecting pin on said hammer and engageable with said trigger rod surface during cocking to urge said trigger rod away from said roller to disengage said notch therefrom.



4,028,837
RELEASE MECHANISM FOR FISHING APPARATUS
Norman E. Clark, 59 E. Utica St., Oswego, N.Y. 13126
Filed June 3, 1976, Ser. No. 692,447
Int. Cl.² A01K 91/00, 95/00
U.S. Cl. 43—43.12 11 Claims

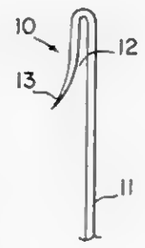


1. A release mechanism for securing a fishing line to fishing apparatus, for releasing the fishing line from the apparatus in response to a strike by a fish, said release mechanism comprising:
fishing line holding means having a gripping condition for gripping the fishing line and a releasing condition for releasing the fishing line from restraint by the fishing apparatus;
ejection means actuable for transferring said fishing line holding means from the gripping condition to the releasing condition; and
trigger means responsive to forces exerted on the fishing line and actuable for actuating said ejection means in response to the sensing of a release force on the fishing line corresponding to a strike by a fish.

4,028,838
CLAMPER FISHHOOK
Alva E. Flower, 603 S. 14th Ave., Bozeman, Mont. 59715
Filed Dec. 2, 1975, Ser. No. 637,101
Int. Cl.² A01K 83/00
U.S. Cl. 43—43.16 9 Claims

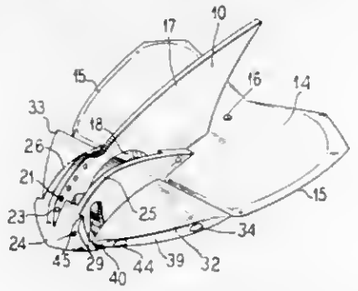
4. A fishhook having a shank end and a hook end connected thereto,
said hook end comprising
a wire bent back upon itself to form a narrow constricted throat or passage between the ends of said wire with a first portion of said wire extending from a pointed end to a connecting bent portion and a second portion of said wire extending from said connecting bent portion to said shank end with an intermediate portion of each

said first and second portions of said wire forming said narrow constricted throat or passage,



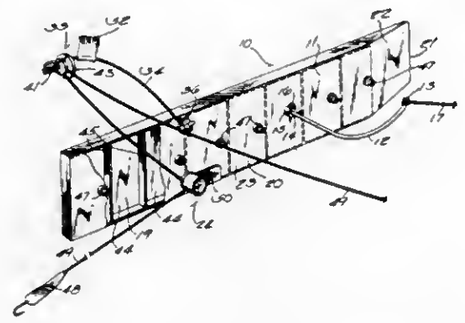
and means to wedge and hold the tissue of a fish in said narrow constricted throat or passage when a fish is caught on the fishhook.

4,028,839
DEPTH CONTROL DEVICE FOR USE WHILE FISHING
Robert A. Stubblefield, 539 W. 300 North, Salt Lake City, Utah 84116
Filed Oct. 21, 1975, Ser. No. 624,438
Int. Cl.² A01K *95/00*
U.S. Cl. 43—43.13 **11 Claims**



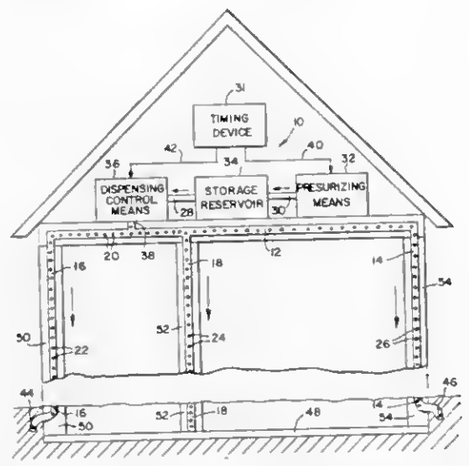
1. A trolling depth control device for use in troll fishing comprising,
a body portion,
first vertical fin means extending out of said body portion and forming fixed vertical water action surfaces to stabilize the device,
said vertical fin means having formed thereon attaching means for connecting said device to trolling lines,
second horizontal fin means extending out of said body portion and forming fixed horizontal hydrofoil surfaces,
a depth control fin,
means rotatably mounting said depth control fin on said body portion so that said depth control fin forms a movable control surface adjacent to said horizontal hydrofoil surfaces which is movable through a common plane relative to said horizontal fin means,
said depth control fin being rotatably movable to selectively inclined positions relative to said hydrofoil surface to change the angle to attack of the device during trolling, and
thermal control means connected between said depth control fin and said body portion to adjustably move said depth control fin automatically as a function of the thermal variations of the water,
whereby said device may be used to tow a fishing line to selected depths of water.

4,028,840
TROLLING SKI
Mark E. Wille, 2954 N. 124th St., Wauwatosa, Wis. 53222
Filed Apr. 23, 1976, Ser. No. 679,827
Int. Cl.² A01K *93/00*
U.S. Cl. 43—43.13 **8 Claims**



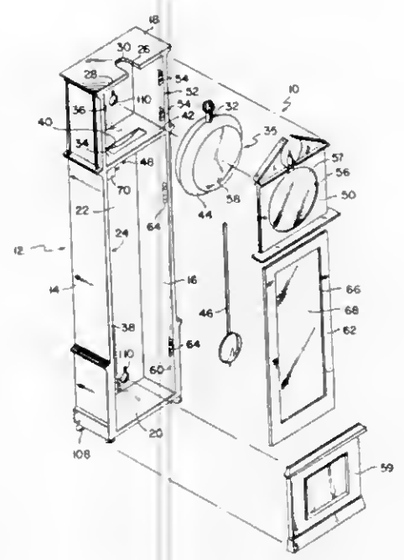
1. A trolling ski adapted to be towed by a boat and to carry a fishing line laterally away from the boat comprising:
a. a buoyant elongated body;
b. first means on the body for attaching a tow line extending from the boat thereto;
c. second means on the body for demountably attaching a fishing line at a point on the line intermediate the boat and the end of the line;
d. at least a portion of the body defining a hollow closed interior; and,
e. closure means providing communication with the hollow closed interior for the addition and removal of ballast.

4,028,841
DISTRIBUTION SYSTEM FOR VERMIN CONTROL COMPOSITION
Carl Lundwall, Maspeth, N.Y., assignor to Lawrence Peska Associates, Inc., New York, N.Y., a part interest
Filed May 24, 1976, Ser. No. 689,567
Int. Cl.² A01M *1/24*
U.S. Cl. 43—124 **7 Claims**



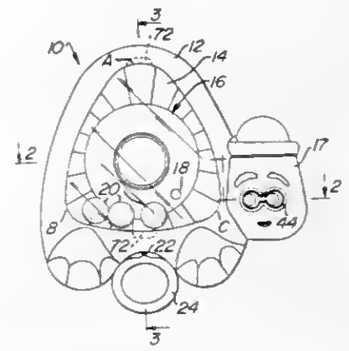
1. A distribution system for a fluid vermin control composition comprising pipe means disposed in a building, said pipe means operatively connected to means for automatically and periodically delivering a fluid vermim control composition through said pipe means, means in said pipe means for releasing said fluid from said pipe means.

4,028,842
POCKET WATCH DISPLAY KIT
John W. Adams, 4901 Riverton Lane, Bowie, Md. 20815
Filed May 4, 1976, Ser. No. 683,009
Int. Cl.² A63H *33/00*
U.S. Cl. 46—1 R **8 Claims**



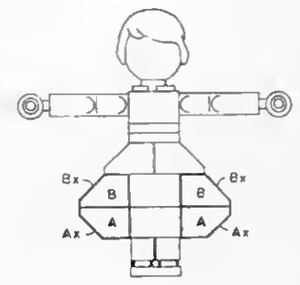
1. Pocket watch display kit comprising:
a hollow box like housing including lateral side portions, an upper lateral portion and a lower lateral portion each fixedly secured to a back portion and to adjacent portions forming an open ended chamber therein, said upper lateral portion having a semioblongitudinal notch in the free edge thereof extending toward said back portion, the internal edges of said notch adapted to accommodate a pocket watch crown therebetween, said internal edges permitting the free rotation of said crown;
a lateral support shelf affixed within said chamber substantially parallel to said upper lateral portion and adjacent thereto, said latcral support shelf dividing said chamber into an upper chamber and a lower chamber, said lateral support shelf having an arcuate groove disposed in the surface thereof opposite said upper lateral portion, said arcuate groove adapted to accommodate the circular edge of a pocket watch, said lateral support shelf thereby supporting said pocket watch within said first chamber when said circular edge thereof is placed in said arcuate groove and said crown is placed within said notch;
a pendulum element disposed within said lower chamber and pivotally affixed by a pivot to said lateral support shelf, the longitudinal axis of said pivot substantially normal to said back portion;
a first door element hingedly affixed over the opening in said upper chamber by first hinge means, said first door element having an opening and a first transparent window element disposed therein, said first window element permitting visual access to the face of said pocket watch;
a lower panel element fixedly secured to said housing partially covering the opening in the lowermost portion of said lower chamber; and
a second door element hingedly affixed by second hinge means to said housing over the opening in said lower chamber above said front panel, said second door element having an opening and a second transparent window element therein, said second transparent window permitting viewing of said pendulum element.

4,028,843
CHILD'S TOY
Mel Appel, Livingston, N.J., assignor to Gabriel Industries, Inc., New York, N.Y.
Filed May 12, 1976, Ser. No. 685,562
Int. Cl.² A63H *33/00*
U.S. Cl. 46—1 R **17 Claims**



1. A child's toy, comprising:
a frame having a recess therein;
a hub rotatably mounted on said frame within said recess, said hub having a flexible projecting member for yieldingly striking at least one ball located within said frame recess upon rotation of said hub with respect to said frame;
means for rotating said hub from a rest position with respect to said frame;
means for automatically returning said hub to said rest postion; and
a dome secured to said frame, said dome covering said recess and said hub.

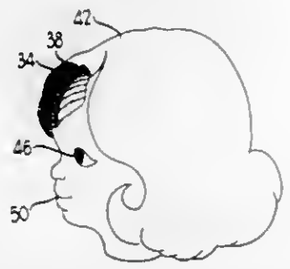
4,028,844
TOY BUILDING BLOCK FOR SUPPLEMENTING EXISTING BLOCK SETS
Erling Thue Dideriksen, and Jens Nygaard Knudsen, both of Billund, Denmark, assignors to Interlego A.G., Switzerland
Filed May 17, 1976, Ser. No. 687,218
Claims priority, application Denmark, May 23, 1975, 2288/75
Int. Cl.² A63H *33/08*
U.S. Cl. 46—22 **2 Claims**



1. A toy building block having means for joining with other blocks of known design having complementary means, said block having a square face, a pair of opposing trapezoid end faces disposed at right angles to the bottom face, a rectangular side face disposed at right angles to the bottom face and the trapezoid end faces, a rectangular top face extending parallel to the bottom face, an inclined face extending from the top face towards the bottom face intermediate the trapezoid end faces, said joining means including four projections extending normally from said bottom face and disposed symmetrically with respect to the center of said square, a rectangular recess in the top face and a projection within said recess extending co-axially with the centre of said recess, the width of said

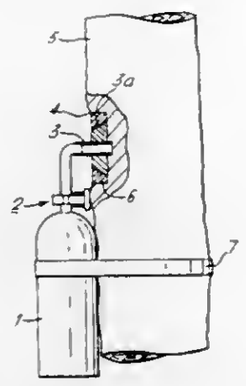
projection being equal to the spacing between the projections in the bottom face and the width of the latter projections being equal to the width of the recess in the top face.

4,028,845
LAYERED SKIN DOLL
Gunars Licitis, Lombard, Ill., assignor to Marvin Glass & Associates, Chicago, Ill.
Filed Jan. 21, 1976, Ser. No. 650,894
Int. Cl.² A63H 3/00
U.S. Cl. 46—164 8 Claims



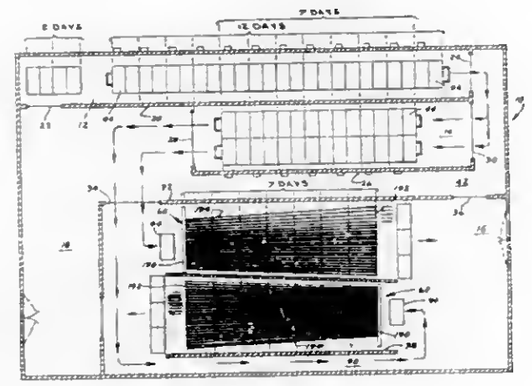
1. A multiple layered figure toy, comprising:
a pliable impervious outer smooth molded plastic skin of predetermined shape defining the exterior features of the figure toy; and
a substantially rigid impervious inner molded plastic layer of similar material, interiorly cured with said outer skin retaining said outer skin in its predetermined shape and defining an internal cavity within the figure toy.

4,028,846
PLANT TREATMENT
John Francis Leslie Floyd, and James Robert Charles Elliott, both of 3 Woodside Ave., Chesham Bois Amersham, Buckinghamshire, England
Filed Jan. 13, 1976, Ser. No. 648,718
Int. Cl.² A01G 29/00
U.S. Cl. 47—57.5 2 Claims



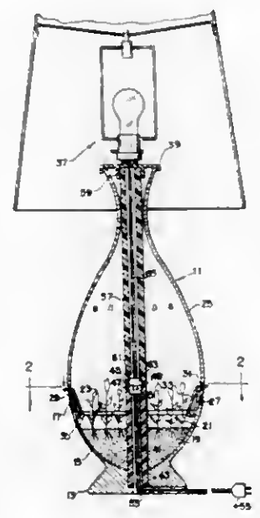
1. A method of treating a plant to combat disease or pest infestation comprising the steps of:
producing an opening in said plant;
inserting a wedge-shaped collar in said opening of the plant;
hermetically securing a pipe having an annular sloping plug thereabout in said collar;
connecting a pressurized container having a spring biased nozzle valve to said pipe for delivering energized droplets of a liquid to said plant with said spring biased valve compressed against said plant and thereby releasing said energized droplets through said pipe into said plant.

4,028,847
APPARATUS FOR PRODUCING PLANTS
Noel Davis, Wayzata; William M. Dreier, and Stanley C. Rustad, both of Golden Valley, all of Minn., assignors to General Mills, Inc., Minneapolis, Minn.
Filed Feb. 19, 1976, Ser. No. 659,311
Int. Cl.² A01G 31/02
U.S. Cl. 47—65 30 Claims



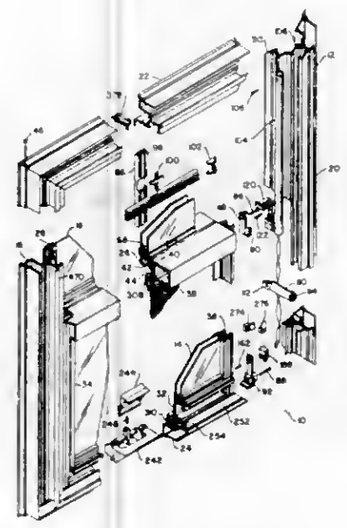
1. Apparatus for growing plants comprising an elongated housing having at least one chamber therein, said chamber having first and second ends, a plurality of elongated track means having an inlet end and a discharge end, means for mounting said track means within said chamber so that they extend generally longitudinally therein, said track means being arranged relative to each other so that they diverge outwardly so as to form a fan-shaped array of pathways extending from one end of the chamber to the other end, the discharge ends of said track means being spaced apart a greater distance than the inler ends, means for holding said plants in a prescribed manner so that they can be introduced into the inlet end of the track means, and means for moving said plants from said inlet end of said track means to the discharge end at a prescribed speed.

4,028,848
LAMP PEDESTAL WITH TERRARIUM BOWL
David E. Murray, Detroit, Mich., assignor to Michael D. Murray, Farmington, Mich., a part interest
Filed May 21, 1976, Ser. No. 688,845
Int. Cl.² A01G 9/02
U.S. Cl. 47—69 5 Claims



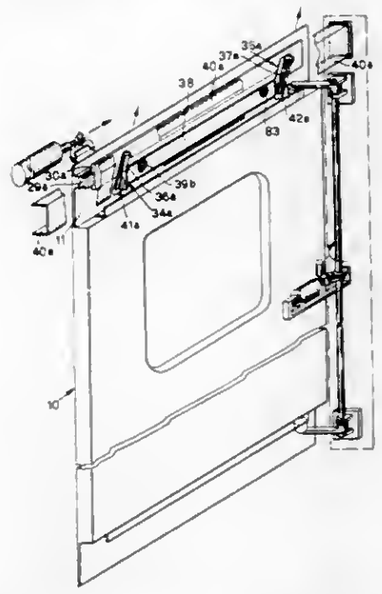
1. In a lamp including a base, a bowl, a bulb socket, and wiring joined to said socket and adapted for connection to a power source; the improvement comprising:
a terrarium lower bowl of transparent material forming a part of and projecting from said base terminating in an annular rim defining an open end;
said bowl adapted to hold soil material and growing plants;
an upper bowl of transparent material open at its lower end and formed with an inset annular flange bearing against and extending into said lower bowl annular rim with said upper bowl supported upon and forming a continuation of said lower bowl;
said wiring extending through said upper and lower bowls and exiting from said base;
an annular bead upon the interior of said lower bowl rim below its open end;
said base flange being formed with an external groove retainingly receiving said bead.

4,028,849
WINDOW STRUCTURE
Richard N. Anderson, Owensboro, Ky., assignor to V. E. Anderson Mfg. Co., Owensboro, Ky.
Division of Ser. No. 121,985, March 8, 1971, Pat. No. 3,795,076, and a continuation-in-part of Ser. No. 36,303, June 22, 1970, Pat. No. 3,711,995. This application Mar. 5, 1974, Ser. No. 448,257
Int. Cl.² E05D 15/22
U.S. Cl. 49—181 22 Claims



1. Window structure for installation both as a single-hung window or as a hopper window and as a right or left hand glider window including a frame having a fixed frame rail, guiding frame rails, a locking frame rail and a frame check rail, at least one movable sash secured within the frame for selective movement in the plane of the window frame and tilting out of the plane of the window frame about one edge of the sash including a tilt rail, guide rails having longitudinal recesses therein and a lock rail, and sash guide and pivot structure positioned at least partly within the longitudinal recesses of the sash guide rails and secured to opposite corners of the movable sash, spacing the movable sash from the frame rails, finishing the ends of the movable sash guide rails at the ends of the sash lock rail to prevent damage to weather stripping on pivoting of the movable sash about the lock rail thereof and providing a pivot axis for the movable sash on pivoting thereof, which sash guide and pivot structure is operable to lock the movable sash in a pivoted position with respect to movement of the movable sash along the frame, which sash guide and pivot structure includes a rectangular portion adapted to fit within the movable sash guide rail at the end thereof adjacent an end of the sash lock rail, an L-shaped flange extending over perpendicular sides of the rectangular portion for engaging the side and one end of the guide rail of the movable sash and an elongated pivot portion extending on the opposite side of the flange from the rectangular portion of the sash guide and pivot structure and away from the sash guide rail and into the guiding frame rail in installation on a movable sash installed in the window structure and having a larger dimension in the plane of the window structure than transversely of the window structure whereby on tilting of the movable window sash the pivot portion of the sash guide and pivot member extending within the guiding frame rail engages portions of the rail to lock the movable sash in the frame with respect to movement of the sash along the frame.

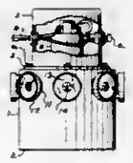
4,028,850
SLIDING-WING DOOR FOR VEHICLES
Alessandro Marzocco, Milan, Italy, assignor to Socimi Societa Costruzioni Industriali Milano S.p.A., Milan, Italy
Filed Oct. 16, 1975, Ser. No. 623,083
Claims priority, application Italy, May 7, 1975, 23115/75
Int. Cl.² E05D 15/10
U.S. Cl. 49—212 2 Claims

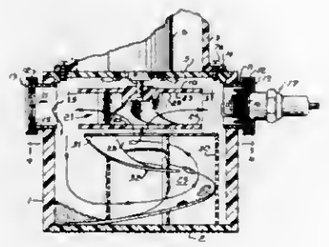


1. A sliding-wing door for vehicles, comprising at least one door panel suspended to a first member of a telescopic guide, a second member of which is carried by at least two liner ejectors having a slidable member fixed to said second member and a stationary member attached to a rigid structure affixed to the vehicle, rolling bearings being inserted between said members of the telescopical guide and between said members of each linear ejector, each bearing being mounted on a pin which is solid with one of said members and is slidingly coupled to and guided by a rectilinear pathway of the other member through said bearing, the stationary members of said linear ejectors being fixed to a supporting structure which is attached to said rigid structure by means of a swingable arm equipped with a clamping member and mounted on a vertical pin carried by said rigid structure and by means of a locking bolt spaced from said arm, the structures being equipped with passageways, with side clearance, for said arm and said bolt and with respective curved resting surfaces faced to said passageways, the resting surface for the locking bolt being adjustable by means of a spreading member which is screwed in the supporting structure and is axially passed through with side clearance by the locking bolt, the locking bolt being also arranged to axially pass with side clearance through an abutting member with curved surface engaged with said spreading member and through a further member which is displaceable along an opposite surface of said abutting member, the locking bolt having a head and an associated

locking nut which rests on said displaceable member and said spreading member through respective washers having a spherical seat.

4,028,851
SPARKPLUG CLEANER
Roy A. Fricke, 1034 Ashland Ave., River Forest, Ill. 60305
Filed June 3, 1976, Ser. No. 692,341
Int. Cl.² B24C *3/34*
U.S. Cl. 51—412 **15 Claims**

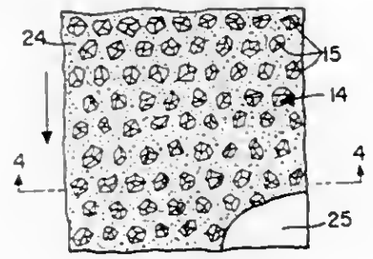




1. In a portable sparkplug cleaner a closed cylindrical vessel having a vertical axis and comprisng two communicating but functionally separate, vertically aligned cylindrical chambers, a driving motor having a vertical shaft disposed in the upper chamber and having a centrifugal, rotatably mounted impeller in the upper chamber, there being a series of tubular radially disposed flexible self-sealing sparkplug holders mounted radially in the cylindrical walls of the first chamber and being arranged in a concentric array and being adapted to receive and hold the threaded electrode ends of sparkplugs to be cleaned, said centrifugal impeller in the upper part of said vessel being journaled in said vessel and being driven by said motor, and having means for discharging particulate against the electrodes of the sparkplugs from various tangential directions, the lower part of the vessel providing a receiving chamber for receiving spent particulate gravitating into said chamber.

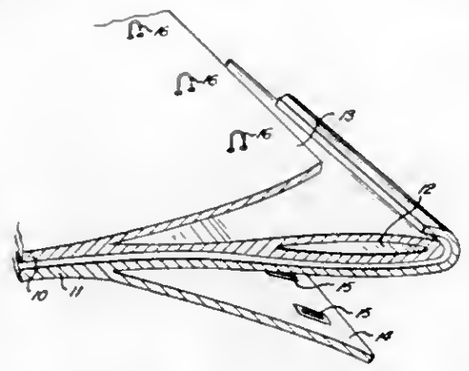
4,028,852
ABRASIVE SEED DEFIBERIZATION
Cecil F. Harrington, Corinth, Miss.; James M. Johnson, and Howard T. Prince, both of Memphis, Tenn., assignors to The Procter & Gamble Company, Cincinnati, Ohio
Division of Ser. No. 516,514, Oct. 21, 1974, Pat. No. 3,943,604. This application Nov. 10, 1975, Ser. No. 630,384
Int. Cl.² B24D *5/02*
U.S. Cl. 51—206 R **3 Claims**

1. A defiberizing cylinder having a seed delinting face on a radially outwardly facing cylindrical surface, said face comprising an open pattern of unpiled, spaced apart abrasive particles which abrasive particles are adhered in contacting relation with said cylindrical surface and with spaced apart relations among said abrasive particles, said open pattern comprising from about 40 to about 80 said abrasive particles



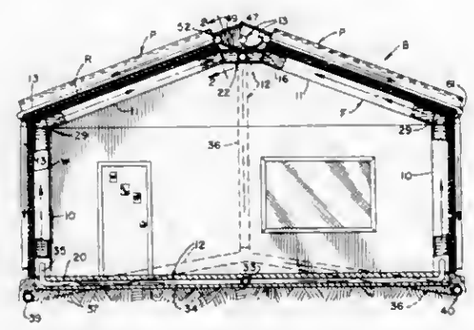
per square inch which abrasive particles are in the size range of U.S. Sieve Series numbers of from about 12 to about 40.

4,028,853
SEALING TOGETHER OF FLEXIBLE SHEETS
Christopher Daniel Dowling Hickey, 5 Heathside, Hinchley Wood, Esher, Surrey, England
Filed June 16, 1976, Ser. No. 696,721
Claims priority, application United Kingdom, July 17, 1975, 30087/75
Int. Cl.² E04B *1/34*
U.S. Cl. 52—2 **16 Claims**



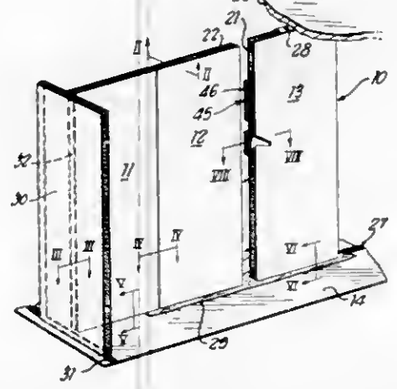
1. A method of sealing together peripheral portions of two flexible sheets comprising the steps of putting together the peripheral portions of the two sheets in overlying relationship together with an inflatable tube extending along the whole length of said peripheral portions, securing the peripheral portions in this position and then inflating the tube.

4,028,854
FIREPROOF MODULAR BUILDING
Richard E. Diggs, 12A Road, Carthage, Mo. 64836
Division of Ser. No. 577,359, May 14, 1975, Pat. No. 4,000,850. This application May 14, 1976, Ser. No. 686,274
Int. Cl.² E04B *1/92*
U.S. Cl. 52—93 **11 Claims**



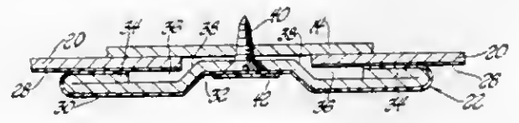
1. A fireproof modular building, comprising a frame including prefabricated non-flammable tubular wall columns and prefabricated non-flammable tubular roof beams supported on the columns, the columns and the beams being adapted to pass non-flammable fluid therethrough, first fluid circulating means connected with the columns and beams to circulate a first non-flammable fluid therethrough, a plurality of rigid, fireproof prefabricated insulated panels secured to and supported on the columns and beams in spanning relationship defining wall and roof structures, respectively, enclosing the building, and load bearing column plates secured to said columns and load bearing roof plates secured to said roof beams, said plates being secured to said columns and roof beams at ends thereof which are adjacent each other and connecting those columns and beams to adjacent structure of the building in a load supporting manner, the plates each having fluid flow passages defined therein which cooperate with flow passages in adjecent plates, said fluid flow passages being aligned to fluidly connect the end adjacent columns and beams via said plate fluid flow passages.

4,028,855
PARTITION WALL JOINTS
John R. Prewer, London, England, assignor to Pallisade Domain Limited, London, England
Filed Dec. 22, 1975, Ser. No. 643,137
Claims priority, application United Kingdom, Dec. 24, 1974, 55670/74
Int. Cl.² E04B *1/38*
U.S. Cl. 52—272 **4 Claims**



1. A method of erecting a partition wall in a building, comprising the steps of
providing a plurality of substantially rigid, substantially straight self-supporting fibres on the top and bottom horizontal edge surfaces of the panel so that the fibres project from the edge surface substantially normally thereto;
providing a plurality of substantially rigid, substantially straight self-supporting fibres in a lower band along the floor surface of the building and in an upper band along the ceiling surface of the building so that said fibres on the floor and ceiling surfaces project substantially normally thereto;
aligning the panel between the upper and lower bands of fibres;
moving the floor and ceiling surfaces relative to one another so as to clamp the panel between the floor and ceiling surfaces and cause the fibres on the top edge surface of the panel to intermesh with the fibres on the ceiling surface and the fibres on the bottom edge surface of the panel to intermesh with the fibres on the floor surface, whereby shear movement between the top and bottom edge surfaces of the panel and the ceiling and floor surfaces, respectively, are substantially prevented.

4,028,856
COVER WALL CONSTRUCTION
Peter M. Dalbec, Clawson, Mich., assignor to Mallyclad Corporation, Madison Heights, Mich.
Filed Jan. 26, 1976, Ser. No. 652,567
Int. Cl.² E04B *2/76*
U.S. Cl. 52—281 **1 Claim**

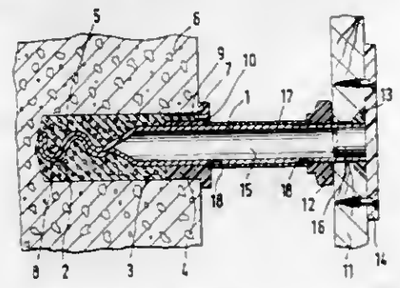


1. Cover wall construction for shipboard modernization and other uses, and comprising;
cribbing for providing a wall supporting structure in front of an older wall to be modernized and including channel members of relatively greater width than depth disposed at baseboard levels, overhead heights and vertically therebetween,
panel members for covering and enclosing said cribbing therebehind and including aluminum sheet stock having a vinyl clad exterior surface and a relative size for spanning baseboard to overhead heights and between next adjacent vertically disposed channel members, means for retaining said panel members in engagement with said cribbing including panel retaining members of extended length and minimal width formed to provide, in cross-section, an inwardly offset center portion for fastener engagement to said channel members and reversely bent side edges for overlapping fastenerless engagement with a panel member edge received thereunder,
fastener means for engaging said panel retaining members to said channel members at spaced intervals both between next adjacent panel members and at baseboard and overhead heights for both a functional and decorative use,
said panel retaining members being formed from like vinyl clad aluminum stock as said panel members and having said vinyl cladding provided over the reversely bent side edges thereof,
the center portion of said panel retaining members being set inwardly sufficiently to extend rearwardly less than a panel thickness beyond the reversely bent side edges thereof for both double and single panel edge engagement use,
inside and outside corner covering members having each right angle portion of comparable cross-section to said panel retaining members,
and pressure-sensitive adhesive coated decorative tape for use with said retaining and corner covering members in obscuring and protecting the headed ends of said fastener means as used within the inwardly set center portions thereof.

4,028,857
METHOD AND ARRANGEMENT FOR MOUNTING AN OBJECT AT A DISTANCE FROM A SUPPORT STRUCTURE
Artur Fischer, Weinhalde 34, D-7241 Tumlingen Gde. Waldachtal, Germany
Continuation-in-part of Ser. No. 616,072, Sept. 23, 1975. This application Apr. 8, 1976, Ser. No. 675,053
Claims priority, application Germany, Sept. 26, 1974, 2445897; Apr. 12, 1975, 2516015; Apr. 22, 1975, 2517761; Sept. 10, 1975, 2540197
Int. Cl.² E04B *1/56, 1/40*
U.S. Cl. 52—309.2 **16 Claims**

1. An arrangement for mounting an object at a distance from a support structure, particularly a low-strength structure having a mounting surface and an anchoring hole, comprising

an anchoring member having a leading anchoring portion for insertion into said hole with clearance, and a trailing elongated mounting portion extending outwardly of said hole in a predetermined orientation relative thereto beyond said mounting surface upon insertion; means for fixing said anchoring portion in said hole, including means for admitting a hardenable substance into said clearance so as to form a plug about the exterior of said anchoring portion and thereupon fix the anchoring member in position in said hole upon hardening of the substance, and a cap member mounted in said hole and



having a cover part which overlies and seals said hole from escape of hardenable substance, and a retaining part which surrounds and retains the anchoring member in said orientation so as to hold the anchoring member against displacement out of said orientation by gravity while said substance is hardening; and means for mounting an object on said mounting portion at any of a plurality of locations spaced lengthwise of said mounting portion, said mounting means comprising means for positioning the object at a predetermined distance from the support structure and means for holding the object in place at a selected predetermined distance.

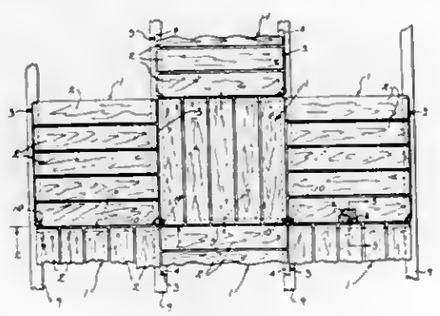
DECK BLOCK

Erwin G. Rehbein, P.O. Box 80A, Waupaca, Wis. 54981

Filed Mar. 5, 1976, Ser. No. 664,156
Int. Cl.² E04F *13/08*; **E04C** *1/10*
U.S. Cl. 52—384 **4 Claims**



1. A deck block comprising a plurality of strips of wood of equal length disposed side by side in loosely spaced relation with their ends in a common plane, and channel members extending one each across the corresponding aligned ends of said strips each of said channel members including a body and internal side flanges with one inturned side flange of said member frictionally embedded in a groove substantially parallel to the common plane of the strips and extending inwardly from the ends in all of said strip ends and with the body of each said member bearing substantially tightly against the corresponding aligned ends of said strips, and with the other inturned side flange of each of said members frictionally engaging said strips, whereby each said channel member totally engages and retains said strips in spaced position.

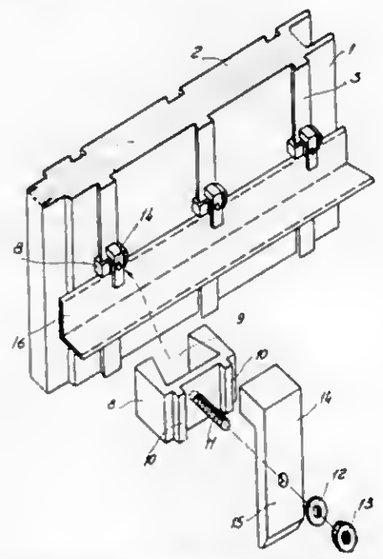
HEAT-INSULATING PANELS

Pietro Bellagamba, Via A Porta 4, 29100 Piacenza, Italy

Filed May 6, 1976, Ser. No. 683,856
Claims priority, application Italy, May 14, 1975, 23335/75
Int. Cl.² E04B *2/32, 2/88*
U.S. Cl. 52—393 **6 Claims**



1. A heat-insulating panel, particularly adapted for walls of buildings, including two parallel thin ribbed metal sheets covering an intermediate layer, consisting of a heat-insulating resin, in which the said covering metal sheets show in positions corresponding to each other and at a regular distance undercut reliefs projecting on one face whereat there are inserted coupling organs of the said metal sheets, consisting of material having a low thermal conductivity, and one each projecting relief there are fixed movably fastening means to the support structures and the end portions of the two metal sheets are folded over and shaped so as to build a concave edge and a convex edge, which may be coupled by embedding with each other and provided on their inner surfaces with gaskets having a series of longitudinal lamellar reliefs, placed in intercalated positions.

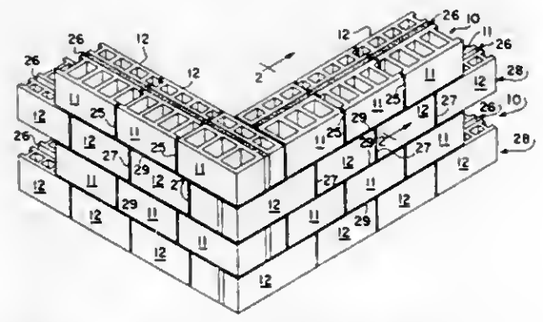
WALL CONSTRUCTION

Henry F. Hope, and Stephen F. Hope, both of 2548 Wyandotte Road, Willow Grove, Pa. 19090

Filed Jan. 15, 1976, Ser. No. 649,224
Int. Cl.² E04B *1/02*
U.S. Cl. 52—565 **5 Claims**



1. A masonry wall construction comprising
a plurality of successive vertically disposed horizontal courses of masonry blocks,
one of said horizontal courses having on the exterior thereof in succession a plurality of first hollow rectilinear blocks of a predetermined size with flat faces on the top and bottom thereof and vertical interior openings connecting said flat faces and with vertical mortar joints between the ends of said first blocks,
said first blocks having vertical ribs bounding said interior openings,
said first blocks having their outer exposed side faces in a vertical outer wall plane,
said one horizontal course having in succession a plurality of second rectilinear blocks of a small predetermined size spaced from the first blocks with flat faces on the top and bottom thereof and vertical interior openings connecting said flat spaces and with vertical mortar joints between the ends of said second blocks,
said second blocks having vertical ribs bounding said interior openings,
said second blocks having their exposed side faces in a vertical inner wall plane spaced from the outer wall plane,
the next succeeding horizontal course having on the interior thereof in succession a plurality of said first blocks with vertical mortar joints between the ends thereof and in transversely overlapping relation to the first blocks of said one course and with their exposed faces in the vertical outer wall plane,
said succeeding horizontal course having in succession a plurality of second blocks with vertical mortar joints between the ends thereof spaced from said first blocks of said succeeding course and with their exposed side faces in the vertical inner wall plane,
the ribs of blocks of successive horizontal courses being offset and out of contact with each other.

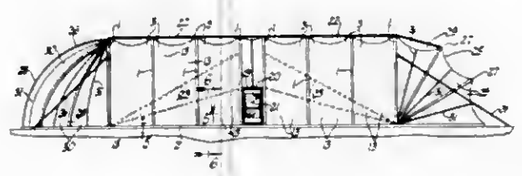
ERECTION METHOD FOR A VAULTED MEMBRANE STRUCTURE

Carl Frederick Huddle, Pleasant Ridge, Mich., assignor to Tension Structures Co., Pleasant Ridge, Mich. and Jon D. Vredevoogd, Lansing, Mich., part interest to each

Continuation-in-part of Ser. No. 597,970, July 21, 1975, which is a continuation-in-part of Ser. No. 399,333, March 8, 1973, abandoned, which is a continuation-in-part of Ser. No. 93,293, Nov. 27, 1970, abandoned. This application June 29, 1976, Ser. No. 700,846
Int. Cl.² E04G *21/00*
U.S. Cl. 52—745 **20 Claims**



1. A method of constructing a vaulted membrane structure comprising a frame of substantially vertical arches with curved bights spaced apart with their respective ends aligned and mounted on a base to permit horizontal movement; a flexible roof membrane extending between and operatively attached to said arches and said base that is tensioned to a stiffened state with an inward concave curvature between the bights of said arches, said inward concave curvature having been formed by said membrane having a shorter circumference in a vertical plane midway between adjacent arches than its circumference where it is operatively attached to said adjacent arches and means to fix said arches in their erected position to maintain tension in said roof membrane; said method of erection comprising the following steps:
a. Prefabricating said roof membrane in sections or as a whole such that its circumferential length is a vertical plane midway between adjacent vertical arches is less than its circumferential length where it is operatively attached to said adjacent vertical arches,
b. Assembling and disposing said vertical arches, comprising at least one section of said shelter frame, on the base in recumbent positions with their corresponding ends aligned and their crowns similarly oriented but spaced apart sufficiently to facilitate attaching said membrane,
c. Operatively attaching said roof membrane to at least a portion of the crown of said arches,
d. Raising at least two arches, while abutting each other, to an upright position,
e. Moving said arches apart and tensioning the membrane as the arches are moved to their final position,
f. Fixing said arches apart to maintain tension in said membrane,
g. Securing the lower portion or edge of said membrane between said adjacent arches.

4,028,862

PACKAGING CLAMP AND METHOD

John L. Harris, Bettendorf, Iowa, and Bror H. Nelson, Moline, Ill., assignors to Aluminum Company of America, Pittsburgh, Pa.

Division of Ser. No. 493,383, July 31, 1974, Pat. No. 3,971,469. This application Jan. 2, 1976, Ser. No. 646,062
Int. Cl.² B65B *27/00*
U.S. Cl. 53—3 **1 Claim**

1. A packaging method, comprising the steps of placing clamps at a plurality of locations on a material to be packaged, with each clamp bearing against a bottom portion and a top portion of the material to be packaged, and tying lines between the clamps for securing the clamps on the material; wherein the material to be packaged is a plurality of curved plates, the step of placing clamps including arranging clamp lower halves at desired locations on the bottom of the plate which is to form the bottom plate of the final package, the inside of the curvature of the bottom plate facing downwards, the step of tying lines including tying lines between the bottom halves of the clamps, the lines passing over the outside of the curvature of the bottom plate, the step of placing further including placing the remainder of the plates over the bottom plate, the insides of the curvatures of said remainder of the plates facing downwards, putting clamp top halves in position against the top plate of the package, and connecting the top and bottom halves of each clamp together for maintaining the bearing relationship of the top and bottom halves of the clamps against the top and bottom portions of the piled plates, and the step of tying lines further including tying lines between the clamps and passing over the outside of the curvature of the top plate.

4,028,863

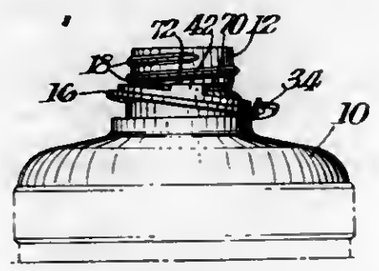
METHOD OF MANUFACTURING CONTAINER SAFETY CLOSURE SYSTEM

Frank S. Nixdorff, Baltimore, Md., assignor to Anchor Hocking Corporation, Lancaster, Ohio

Division of Ser. No. 522,619, Nov. 11, 1974, Pat. No. 3,958,709. This application Feb. 25, 1976, Ser. No. 661,272
Int. Cl.² B65B *7/28*
U.S. Cl. 53—15 **8 Claims**

1. A method of assembling a safety closure system on a container having an open neck through which the contents are dispensed comprising mounting a locking ring around the container neck for rotation in only the locking direction, providing a locking tooth on a hinged portion of the locking ring, providing a cap for closing the neck with the cap having complementary locking elements for engagement by the hinged tooth on the locking ring, providing complementary

contact elements on the cap and locking ring, mounting the cap on the container neck by rotation in the locking direction until the complementary contact elements contact each other, continuing the locking rotation of the cap while simultaneously rotating the ring in the locking direction with the locking tooth properly registered with respect to the complementary locking elements until the cap has closed the neck dispensing opening.

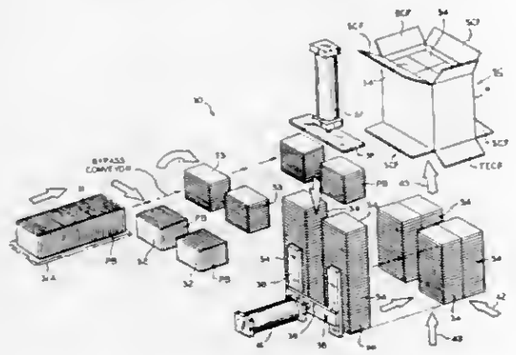


4,028,864

MACHINE AND METHOD FOR PACKAGING FLAT ARTICLES SUCH AS PAPERBACK BOOKS OR THE LIKE

John T. Bell, St. Charles, Ill., assignor to Container Corporation of America, Chicago, Ill.

Filed Mar. 16, 1976, Ser. No. 667,253
Int. Cl.² B65B *5/06, 35/50, 63/02*
U.S. Cl. 53—24 **16 Claims**



1. Apparatus for packaging flat articles, such as books or the like, arranged in one or more adjacent stacks of equal numbers in a shipping container, said apparatus comprising:

a. means for placing said articles in side-by-side stacks with the sides of said articles in contact with each other;

b. means for imposing a controlled pressure load on the stacks to compress the articles so that a predetermined number of articles of each stack has a constant dimension;

c. means for removing a predetermined number of articles from said stacks thus constituting removed articles, said means including means for restraining the articles remaining in said stacks;

d. means for enclosing the removed articles in a shipping container having closure flaps thereon;

e. means for selectively adding additional articles to said enclosed removed articles to provide a desired number of articles within said container;

f. means for closing the closure flaps of said shipping container.

12. The method of packaging flat articles such as books or the like in a shipping container with a base number of said articles or in multiples of said base number in said container, said articles being stacked in said container in a plurality of side-by-side individual stacks, said method comprising the steps of:

a. placing said articles in side-by-side stacks with the sides of said articles in contact with each other;

b. imposing a load of a controlled amount whereby the number of articles within a given dimension of the stack is a constant;

c. removing a constant number of articles from said stacks and restraining the articles remaining in said stacks for subsequent removal;

d. enclosing the removed stacks in a container having a closure flaps thereon;

e. adding articles to said enclosed stacks selectively to provide a desired number of said articles within said container;

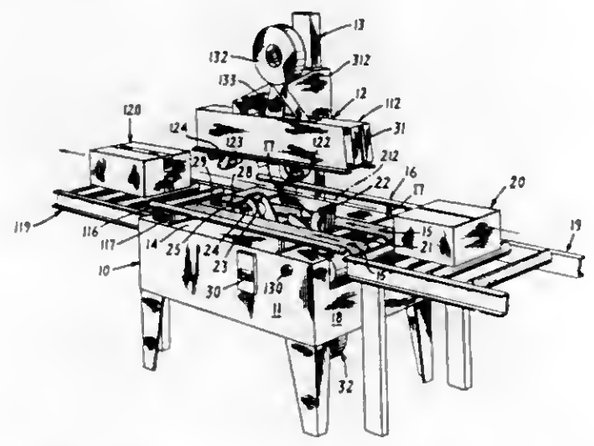
f. closing the closure flaps of said container.

4,028,865

CONTROL MECHANISM FOR CARTON SEALING MACHINE ELEVATOR HEAD

Winton Loveland, Fort Salonga; Horst J. Hanemann, Manhasset, both of N.Y., and Saul Warshaw, Hawley, Pa., assignors to The Loveshaw Corporation, Deer Park, N.Y.

Filed Jan. 14, 1976, Ser. No. 648,916
Int. Cl.² B65B *57/02*
U.S. Cl. 53—76 **5 Claims**



1. A tape sealing machine elevator head control equipment which avoids tipping up a loaded and tape-sealed carton as it is being advanced to the machine discharge end for withdrawal of its trailing end from beneath the lowered elevator head which bears by forces including gravity down on the flaps closing top of this carton during the application of the tape thereto, comprising

(1) powered means to raise the elevator head above the forward travel path of said flaps closing carton top and then to dictate the gravity loading thereof down on the carton top as the carton is being advanced through the machine for application of tape thereto, and

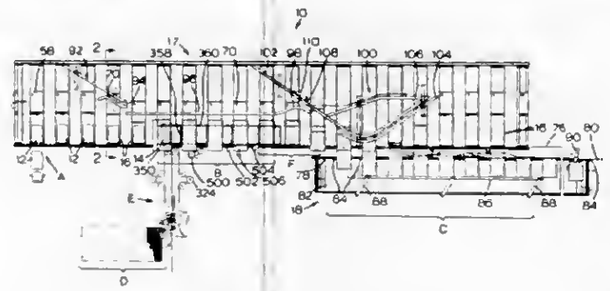
(2) control means responsive to the forwardly traveling carton in the vicinity of the machine discharge end section to activate said powered means for raising the elevator head up from the taped carton top for a relatively short period of time sufficient to relieve the carton back end of the load of the head as this carton back end is withdrawn from therebeneath and then as this taped carton travels beyond said head, drop the latter back down to its initial position for cooperation with the succeeding carton.

4,028,866

WRAP-AROUND CARTON FORMING MACHINE

Marinus J. M. Langen, Rexdale, Canada, assignor to H. J. Langen & Sons Ltd., Rexdale, Canada

Division of Ser. No. 553,269, Feb. 26, 1975, Pat. No. 3,968,623. This application Sept. 29, 1975, Ser. No. 617,310
Int. Cl.² B65B *11/22*
U.S. Cl. 53—195 **1 Claim**



1. In a wrap-around forming machine for forming cartons from carton blanks of the type having main body portions of different length and end closure flaps projecting from first and second edges of the main body portion, the improvement of

a. first longitudinally elongated conveyor means having a longitudinally elongated first end flap closure station extending in a first datum plane at a first longitudinal edge thereof, said first longitudinally elongated conveyor means being continuously driven through said first end flap closure station,

b. a second longitudinally elongated conveyor means having a longitudinally elongated second end flap closure station at a longitudinal edge thereof in a second datum plane which is disposed paralell to and laterally spaced from said first datum plane, said second longitudinally elongated conveyor being continuously driven through said second end flap closure station,

c. said first conveyor means having carton forming mandrels extending inwardly from said first datum plane on the side thereof remote from said second datum plane to receive carton blanks of various lengths with said first end edges of said main body portion thereof disposed in said first datum plane,

d. said second conveyor means having a longitudinally elongated upwardly directed support surface extending in an edge-to-edge spaced parallel relationship to said first longitudinally elongated conveyor means and disposed inwardly from said second datum plane on the side thereof remote from said first datum plane for receiving the carton blanks after closure of the first end thereof from said first conveyor and locating said second end edges of said main body portion in said second datum plane,

e. first end closure means in said first end flap closure station and operating in said first datum plane for closing said first end of said cartons as they are moved through said first end closure station by means of said first conveyor means,

f. said second end closure means in said second end flap closure station and operative in said second datum plane for closing said second ends of said cartons as they are moved through said second end closure station by means of said second conveyor means,

g. means for moving said partially closed cartons laterally from said first conveyor means to said second conveyor means, and

h. a longitudinally elongated rail having a length which is greater than twice the width of the cartons to be formed in the machine, said longitudinally elongated stop rail being disposed above said second conveyor means and extending longitudinally thereof parallel to said second datum plane, said stop rail being located inwardly from said second datum plane for engaging the first closed end of the carton as it is transferred onto said second conveyor means, and restraining the carton against lateral movement away from the second datum plane as the carton is driven continuously through the second end closure station,

i. support means supporting said guide rail for movement towards and away from said second datum plane whereby the second end edge of main body portions of different lengths may be located in said second datum plane as said second conveyor moves said cartons through said second end closure station.

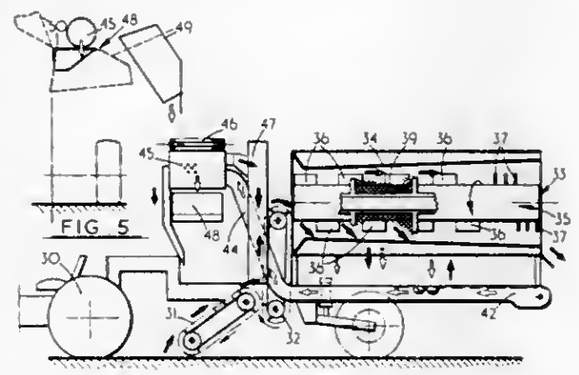
VINERS

Harold Wolstenholme, Bolton, England, assignor to Mather & Platt Limited, Manchester, England

Continuation of Ser. No. 589,828, June 24, 1975, abandoned, which is a continuation of Ser. No. 487,403, July 10, 1974, abandoned, which is a continuation of Ser. No. 386,901, Aug. 9, 1973, abandoned, which is a continuation of Ser. No. 208,266, Dec. 15, 1971, abandoned. This application Apr. 9, 1976, Ser. No. 675,407
Int. Cl.² A01D *45/24*
U.S. Cl. 56—12.8 **7 Claims**



1. In a mobile viner comprising coaxial rotatable riddle and beater drums defining therebetween a riddling and beating chamber for separating the edible crop from the vines, other vegetable matter, stones, and soil (hereinafter simply called "non-crop material"), the improvements wherein:

a. the non-crop material is discharged directly from the riddling and beating chamber onto the ground and

b. the ratio of the riddle drum diameter to the riddle drum length is between 1:2.60 and 1:3.20.

4,028,868

TOWABLE LAWN COMBER

Claude D. Zehrung, Jr., Lakewood, Colo., assignor to Bluebird International, Inc., Englewood, Colo.

Filed Feb. 23, 1976, Ser. No. 660,109
Int. Cl.² A01D *35/24*
U.S. Cl. 56—17.2 **6 Claims**

1. In a towable yard maintenance apparatus connectable to a tow bar which includes a transversely disposed powered shaft carrying rotatable working elements, with the shaft being supported in bearings at opposite end walls of an openbottom transverse hood, the improvement comprising:

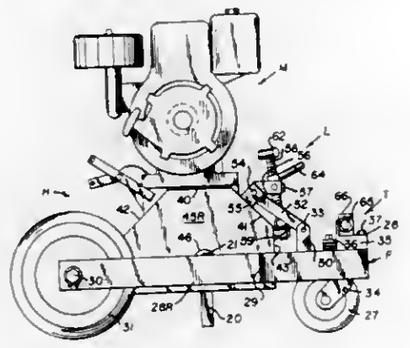
a. a wheel mounted frame structure embracing the hood, having a front member in front of the hood whose width is essentially the same as the width of the hood;

b. side members having forward portions extending rearwardly and outwardly from the ends of the front member and rearward portions extending alongside and rearwardly beyond the ends of said hood, with each side member forming a deflector to engage and to deflect the maintenance apparatus around obstructions encountered as the apparatus is being towed, and with the rearward

portion of each side member being spaced laterally and outwardly from the adjacent end wall of the hood to space the working elements away from the base of an obstruction which may be encountered;

c. front caster wheels underneath the front member supporting the front end of the frame;

d. rear wheels supporting the rear end of the frame mounted within structural pockets in the aforesaid side spaces formed by placing the side members laterally and outwardly from the adjacent end wall of the hood whereby to protect the rear wheels from engagement with obstructions alongside the apparatus;



e. means to lower and raise the hood and working element therein with respect to the frame and

f. a transversely axised tow bar connector at the front member permitting a tow bar connected thereto to swing in a vertical plane whereby the apparatus will ride upon the front and rear wheels at all times as it is pulled over uneven ground.

4,028,869

SPINNING MACHINE WITH AUTOMATIC SERVICE CARRIAGE

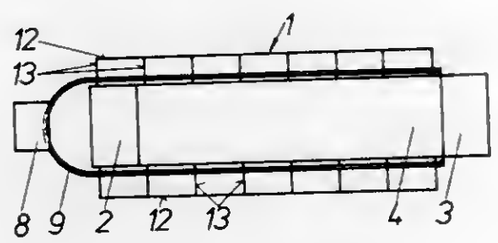
Augustin Schäfer, and Klaus Mogg, both of Ebersbach, Germany, assignors to Zinser Textilmaschinen GmbH, Ebersbach, Germany

Filed Nov. 24, 1975, Ser. No. 634,336

Claims priority, application Germany, Nov. 23, 1974, 2455495

Int. Cl.² D01H *13/16, 13/14, 15/00*

U.S. Cl. 57—34 R **6 Claims**



1. In a spinning machine which includes a plurality of spinning locations and including at least one servicing device capable of movement along said spinning locations, the improvement comprising:

control means for sending control signals from said spinning machine to said servicing device for effecting the movement of the servicing device including optionally servicing said locations during the movement; whereby the operation of said servicing device is dependent on operational states of said spinning machine.

4,028,870

METHOD AND DEVICE FOR PREVENTING CREATION OF FUZZY FIBERS OF YARN DURING TWISTING OPERATION OF THE MULTIPLE TWISTER

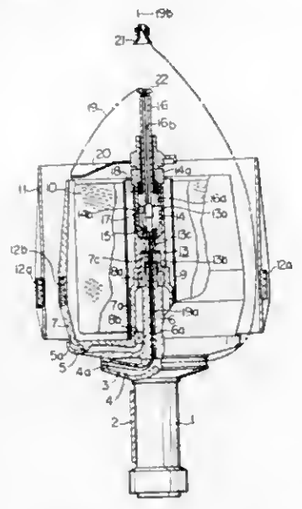
Nobumitsu Kawasumi, Nagoya; Shigeru Muramatsu, Okazaki; Mamoru Suzuki, Aichi, and Yoshiharu Yasui, Kariya, all of Japan, assignors to Kabushiki Kaisha Toyoda Jidoshokki Seisakusho, Japan

Filed Aug. 4, 1975, Ser. No. 601,300

Claims priority, application Japan, Aug. 3, 1974, 49-89309; Dec. 27, 1974, 49-3645; Dec. 28, 1974, 49-2078

Int. Cl.² D01H *7/86*

U.S. Cl. 57—58.84 **18 Claims**



5. In a multiple twister provided with at least a first twisting zone and a second twisting zone successively arranged, a disc for reserving yarn on the peripheral surface thereof, means for introducing a yarn into said first twisting zone, said first twisting zone defined by a spindle provided with a hollow yarn passage coaxially arranged at a position below said yarn introducing means, said second twisting zone defined by said reserve disc rigidly mounted on said spindle and a yarn guide member disposed at a position above said yarn introducing means, said second twisting zone of said reserve disc being connected to a bottom of said hollow yarn passage of said spindle and provided with an outlet opening formed at an outer edge of said reserve dics, a device for eliminating the presence of fuzzy fibers of yarn during a twisting operation comprising, in combination, means for imparting tension to said yarn introduced into said yarn introducing means at a position upstream of said spindle, means for stroking fuzzy fibers projecting from a main body of said yarn against said main body while said yarn in said first twisting zone at a downstream position thereof with said tension imparting means, and second means for stroking fuzzy fibers projecting from a main body of a first twisted yarn delivered from said first twisting zone in said second twisting zone.

4,028,871

PROCESS AND APPARATUS FOR PRODUCING SPUN YARN

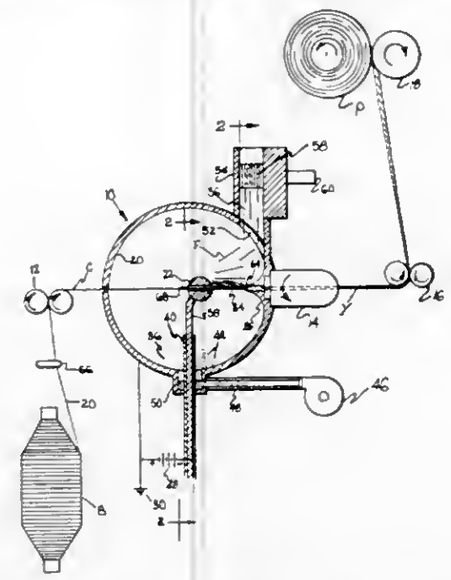
Frank A. Aschenbrenner, Matthews, N.C., assignor to Cor, Inc., Charlotte, N.C.

Filed Aug. 23, 1976, Ser. No. 716,824

Int. Cl.² D01H *1/12*

U.S. Cl. 57—58.89 **37 Claims**

16. Apparatus for producing spun yarn from staple fibers comprising means for producing an electrostatic field having a linear zone of increased field intensity, means for continuously feeding fibers to said electrostatic field for electrostatic migration of fibers by said field to said zone, said electrostatic field producing means including means for physically and electrically shielding said fibers in said linear zone from external disturbances, and means for twisting and withdrawing said fibers from said zone in the form of a spun yarn.



4,028,872

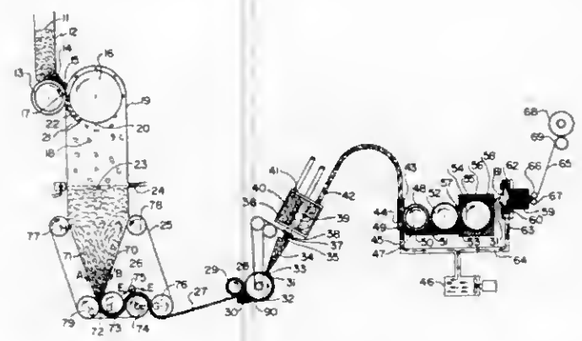
METHOD AND APPARATUS FOR PRODUCING YARN FROM FIBROUS TUFTS

James I. Kotter, Mandeville, and Craig L. Folk, New Orleans, both of La., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.

Filed Apr. 30, 1976, Ser. No. 681,961

Int. Cl.² D01H *1/12;* **D01G** *15/00, 21/00*

U.S. Cl. 57—58.91 **9 Claims**



4. Apparatus for continuously producing yarn from fibrous tufts comprising in combination:

a. a means of forming textile fibers and tufts into a fibrous mass,

b. a means of plucking said fibrous mass from said textile forming means, thereby producing smaller tufts of fibrous material and separating foreign matter from said tufts,

c. a vertical chute with a minimum of air generated to receive and form small tufts into a verticle column of fiber tufts;

d. electronic sensors to maintain the density of said tufts of column (c) said sensors controlling a feed cylinder in an on-off mode of operation, thus controlling the tuft height and thus the density;

e. a low-force lap forming means to transform the column of fiber tufts of (c) into a lap;

f. a licker-in type intermediate opener means where said lap of (e) is drawn into and converted into opened fibers;

g. a pneumatic cleaning means to receive and clean the opened fibers of (f);

h. a pneumatic doffing means to doff said fibers of (g);

i. a transitional duct to feed said opened fibers by means of balanced equal air velocity gradients across said duct;

j. a distributing means to receive and equally disperse said fibers of (i);

k. a chamber to receive said dispersed fibers and wherein said fibers are blended and subdivided in said chamber;

l. said chamber comprising in combination a plurality of outlets to subdivide and equally disperse said fibers;

m. a multiplicity of mini-condensers to condense the fibers, said condenser comprising a means of separating the air stream from the fibers and allowing the air to be exhausted through a suction source;

n. an assembly means to assemble said fibers into identical fibrous ribbons;

o. open end spinners for further processing the ribbons into yarn.

4,028,873

RING SPINNING OR TWISTING MACHINE

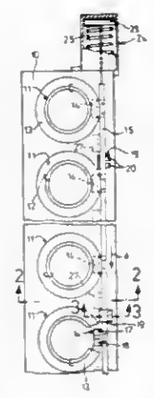
Günter Schulz, and Wolfgang Igel, both of Ebersbach, Germany, assignors to Zinser Textilmaschinen GmbH, Ebersbach, Germany

Filed Aug. 20, 1976, Ser. No. 716,152

Claims priority, application Germany, Aug. 29, 1975, 2538420

Int. Cl.² D01H *7/56*

U.S. Cl. 57—124 **12 Claims**



1. In a ring spinning or twisting machine which includes at least one row of rotatably mounted spinning or twisting rings having flanges, and including permanent magnet devices associated with the rings for generating eddy currents in said flanges when said rings are rotating to effect a reduction in the speed of rotation thereof, the improvement comprising:

movable carrier means for mounting thereon said permanent magnet devices, said carrier means being movably attached to said spinning machine so as to permit displacement of said permanent magnet devices in such a manner that the magnetic field from said permanent magnet devices penetrates said flanges in a first position during maximum eddy current generation and can be moved to at least one second position located substantially laterally adjacent to said flanges.

4,028,874

ROVING AND PROCESS FOR ITS MANUFACTURE

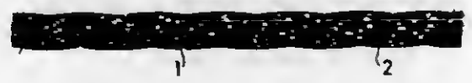
Fritjof Maag, Kelkheim, Taunus; Friedrich Unger, Hofheim, Taunus, and Wilhelm Mohr, Kelkheim, Taunus, all of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

Filed Oct. 6, 1975, Ser. No. 620,149

Claims priority, application Germany, Oct. 7, 1974, 2447715

Int. Cl.² D02G 3/26, 3/38

U.S. Cl. 57—144 7 Claims



1. A roving consisting of a strand of spun fibers and at least one filament yarn wrapped around said strand, wherein the spun fibers are untwisted and unsized and the strand has a total titer of from about 1,000 to 30,000 dtex and the filament yarn has an elongation at break of less than 50%, the roving has a cohesion length of 15 to 500 meters and the number a wrappings of the filament yarn around the fiber strand is in the range of from 20 to 300 times per meter.

4,028,875

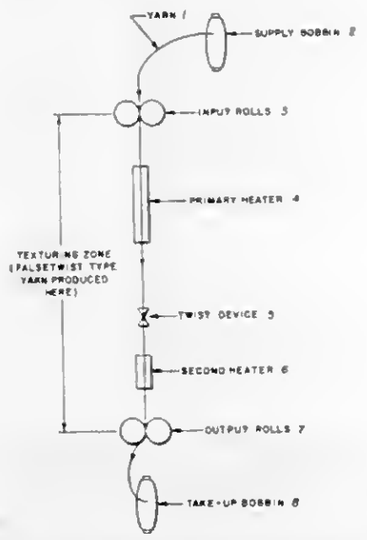
FALSE-TWIST TEXTURING PROCESS

Jing-Pelr Yu, and Donald G. Gilmer, both of Pensacola, Fla., assignors to Monsanto Company, Decatur, Ala.

Filed Mar. 13, 1975, Ser. No. 558,033

Int. Cl.² D01H 7/92; D02G 1/02

U.S. Cl. 57—157 TS 25 Claims



1. A method of processing thermoplastic multifilament feed yarn comprising first heatsetting the yarn in a twisted state at a given temperature under correlated tension to preclude ductility in the cooled yarn, thereby producing a torque yarn; thereafter, continuously and at a tension varying with the correlated tension only to the extent caused by heating and twisting, permitting the yarn to cool, causing the yarn to detwist, and thereafter reducing the torque with a second heat treatment the said yarn not being subjected to tension control between said first heatsetting and said second heat treatment.

4,028,876

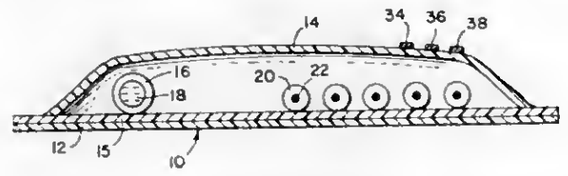
APPARATUS FOR VISUALLY INDICATING ELAPSED TIME BY A COLOR CHANGE

Jorge M. Delatorre, Leisure City, Fla., assignor to Lawrence Peska Associates, Inc., New York, N.Y.

Filed Mar. 5, 1976, Ser. No. 664,307

Int. Cl.² G04F 13/00

U.S. Cl. 58—1 R 7 Claims



1. Apparatus for visual indication of elapsed time by a color change comprising a transparent flexible enclosed receptacle means having a ruptureable sealed container therein, a first fluid chromophoric compound in said container, second chromophoric compound enclosed in a transparent organic film matrix within said receptacle, said first compound and said second compound comprising reactants that form a color body when contacted with one another, said organic film matrix being permeable by said first compound.

4,028,877

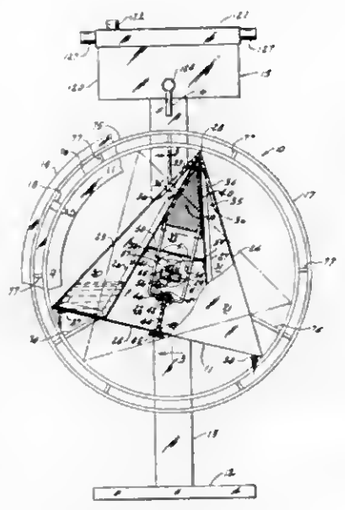
FLUID OPERATED CLOCK

Oskar F. Vatterott, Pacific, Mo., assignor to Jackson J. Shinkle, St. Louis, Mo.

Filed May 3, 1976, Ser. No. 682,713

Int. Cl.² G04B 45/00

U.S. Cl. 58—2 10 Claims



1. A fluid clock comprising:

a. support means.

b. pallet means including opposed fluid compartments each having an inlet opening and a discharge opening and a balance weight means,

c. pivot means mounting said pallet means to said support means for oscillative movement about a pivot center disposed below the combined center of gravity of said pallet means including the balance weight means,

d. a pair of limit means operatively engageable by said pallet means to determine the oscillative travel of said pallet means,

e. fluid supply means disposed to supply fluid to one of said inlet openings when the pallet means engages one of said limit means and to supply fluid to the other of said inlet openings when the pallet means engages the other of said limit means,

f. indicator means mounted in movable relation to the support means, and

g. drive means actuated by the pallet means to move the indicator means in time indicating relation.

4,028,878

CONTROL DEVICE FOR AN ELECTRONIC WRIST WATCH

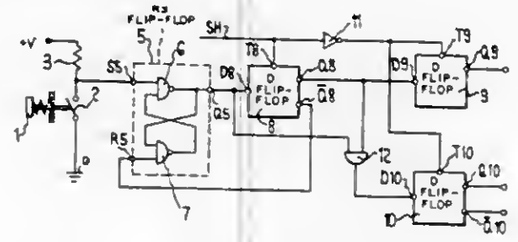
Willy Droz, Hauterive, and Jean-Luc Beguin, Neuchatel, both of Switzerland, assignors to Ebauches S.A., Neuchatel, Switzerland

Filed Nov. 25, 1975, Ser. No. 635,090

Claims priority, application Switzerland, Dec. 11, 1974, 16372/74

Int. Cl.² G04C 3/00

U.S. Cl. 58—23 R 6 Claims



1. A control device for electronic watches, comprising a push-button switch for providing a control signal, memory means having an input for receiving said control signal and an output, a memory signal appearing at said output of the memory means at least as long as said control signal is applied to said memory means, clock-controlled transfer means connected to said output of said memory means, said transfer means having output means connected to a reset input of said memory means for clock-controlled resetting of said memory means upon release of said switch and disappearance of said control signal, respectively, said output of said memory means and said output means of said transfer means being connected to a signal-combining circuit, and a first output circuit connected to said signal-combining circuit and a second output circuit connected to the output means of said transfer means, the state of the two output circuits varying in accordance with the duration of actuation of the pushbutton.

4,028,879

SWITCHING ARRANGEMENT FOR SETTING TIME-MEASURING APPARATUS

Gerhard Moegen, Neubaldham, Germany, and Edward Y. Tang, Los Altos, Calif., assignors to Eurosil G.m.b.H., Munich, Germany

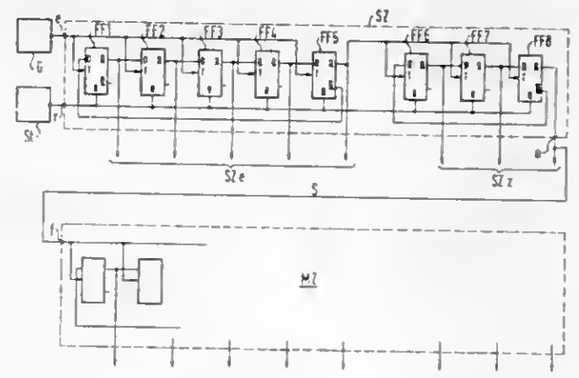
Filed July 24, 1975, Ser. No. 598,849

Claims priority, application Germany, July 26, 1974, 2436129

Int. Cl.² G04C 3/00

U.S. Cl. 58—23 R 14 Claims

1. A switching arrangement for setting or respectively adjusting a time-measuring device comprising at least two counters connected one after the other, of which a first counter changes counter position by count-pulses emitted by a generator circuit at successive intervals of time and the second counter receives a signal from the first counter upon transition of the first counter from one defined counter position into another defined counter position to cause an onward count of the second counter, and a control device for resetting the first counter, characterized in that the counting-range of the first counter is divided into two partial ranges of preferably at least approximately equal size, in one of which the first counter emits a defined first output signal and in the other of which the first counter emits a defined second output signal, and the control device being connected for resetting of the first counter out of a counter position lying in the first partial range into a first reset counter position lying in this first partial range for setting the time measuring device backward and resetting



of the said first counter out of a counter position lying in the second partial range into a second reset counter position likewise lying in the first partial range for setting the time-measuring device forward.

LIFE DISPLAY DEVICE OF A CELL INCORPORATED INTO AN ELECTRONIC TIMEPIECE

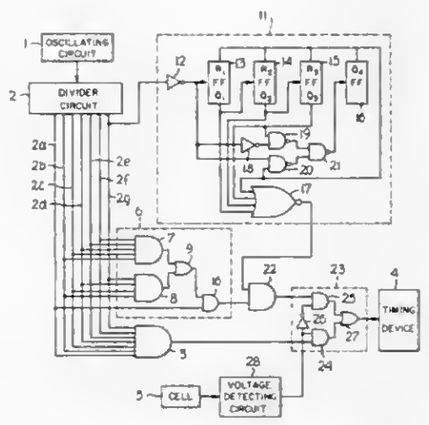
Takashi Ueda, Tokyo, Japan, assignor to Kabushiki Kaisha Daini Seikosha, Japan

Filed Dec. 19, 1975, Ser. No. 642,338

Claims priority, application Japan, Dec. 25, 1974, 50-3562

Int. Cl.² G04C 3/00; G08B 21/00

U.S. Cl. 58—23 BA 6 Claims



1. In an electronic timepiece powered during use by a cell: an oscillating circuit for generating a high frequency output signal; a multi-stage divider circuit connected to said oscillating circuit for receiving therefrom the high frequency output signal and dividing it at successive stages to lower frequency output signals and providing at its last stage standard pulses suitable as a time standard; first gate circuit means connected to the stages of said multi-stage divider circuit for receiving the divided signals therefrom and gating therethrough higher frequency pulses than that of said standard pulses; control pulse generating circuit means for generating a given number of control pulses having a predetermined pulse width in successive predetermined periods; second gate circuit means connected to receive at its input both the higher frequency pulses and said control pulses and operative to gate therethrough a number of higher frequency pulses corresponding in number to said predetermined period within the duration of said predetermined pulse width; a timing device responsive to pulses applied thereto for indicating time; voltage detecting

circuit means connected to the cell for detecting the cell output voltage and providing one signal when the cell voltage is above a predetermined voltage level and another signal when the cell voltage drops below said predetermined voltage level; and third gate circuit means responsive to said one signal for gating said standard pulses to said timing device and responsive to said another signal for gating said higher frequency pulses to said timing device.

4,028,881

MECHANISM FOR CORRECTING CALENDAR IN A WATCH

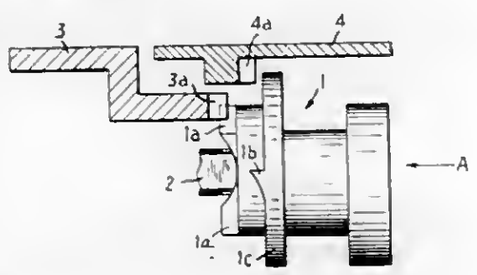
Yasuichi Nakagawa, Kashiwa, Japan, assignor to Kabushiki Kaisha Daini Seikosha, Japan

Filed July 17, 1975, Ser. No. 596,607

Claims priority, application Japan, July 26, 1974, 49-85899[U]

Int. Cl.² G04B 19/24

U.S. Cl. 58—58 2 Claims



1. In a calendar watch: a rotatable date wheel having teeth therearound; a rotatable day wheel having teeth therearound; an axially slidable winding stem mounted for rotation; and means including a correcting wheel mounted for axial sliding movement on said winding stem and having a first set of teeth engageable with teeth on said date wheel when said winding stem is in a predetermined axial position for effecting rotational movement of said date wheel to make a date correction in response to turning of said winding stem in one rotational direction and having a second set of teeth engageable with teeth on said day wheel when said winding stem is in said predetermined axial position for effecting rotational movement of said day wheel to make a day correction in response to turning of said winding stem in the other rotational direction.

4,028,882

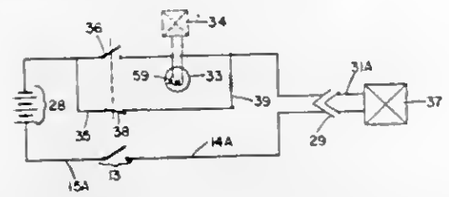
AWAKENING SYSTEM WITH MEANS ADAPTED TO RELAX TENSE MUSCLES

Hrand M. Muncheryan, 1735 N. Morningside St., Orange, Calif. 92667

Filed Feb. 19, 1976, Ser. No. 659,323

Int. Cl.² G04B 47/00; G04C 23/12

U.S. Cl. 58—152 B 21 Claims



1. An awakening system with means adapted to relax tense muscles, comprising: a first electrical unit and a second electrical unit connected theretogether through an elongated connecting means; said first electrical unit comprising a housing having therein a timing mechanism provided with a movable lever means actuated thereby, said timing mechanism receiving a current for operation thereof from an external current source, a current-switching means disposed in said housing and mechanically connected to said movable lever means for actuation thereby and electrically connected to said elongated connecting means; said timing mechanism having means adapted to set the timing of said timing mechanism to any predetermined time of the day; said second electrical unit having a housing containing therein an electrical circuit and means for producing resonant pulsations disposed in said electrical circuit and intimately connected to said housing; an electric source disposed within the electric circuit of said means for producing resonant pulsations and connected thereto for providing an energization current transmitted thereto through said current-switching means, said means for producing resonant pulsations comprising, in the circuit thereof, a vibratory means and a current interrupter means; a current bypass means is connected in the circuit of said means for producing resonant pulsations in electrically parallel relation to said current interrupter means; said current-switching means actuated by said movable lever means is provided with means to electrically connect and disconnect the current to said means for producing resonant pulsations in the housing of said second electrical unit; a current control means having a current-channeling means is disposed in one wall of the housing of said first electrical unit and connected in the electrical circuit of said means for producing resonant pulsations and is adapted to switch the current supplied thereto from one of interrupted mode of operation through said current interrupter means to one of continuous mode of operation by disconnecting the current in said current interrupter means and channeling said current through said current bypass means into said means for producing resonant pulsations; said means for producing resonant pulsations is adapted to be placed under the pillow of a sleeper desirous of waking up at a predetermined time of the day, whereby when said current-switching means located within the housing of said timing mechanism is actuated by the movable lever means of said timing mechanism at the predetermined time of the day to which said timing mechanism has been set to actuate said movable lever means, said means for producing resonant pulsations receives a current from the electric source, disposed within the circuit thereof, through said current interrupter means and produces repeated resonant pulsations which are transmitted through the pillow to the sleeper, and, when said current control means is switched in a manner to electrically isolate said current interrupter means from the circuit of said means for producing resonant pulsations, said latter means receives through said current bypass means a continuous current transmitted thereto from said electric source in the circuit thereof and resonants with a steady, recurring vibratory pulsations, which when transmitted to the tired muscles of a person produces in the muscles microcontractions and relaxations and thereby soothes the muscles thereof to a relaxed physical condition.

4,028,883

GENERATING PLANT AND METHOD OF STARTING UP A GENERATING PLANT

Helmut Meyer-Kahrweg, Wuppertal-Langerfeld, Germany, assignor to Steag Aktiengesellschaft, Essen, Germany

Filed July 28, 1975, Ser. No. 599,384

Claims priority, application Germany, Aug. 6, 1974, 2437782

Int. Cl.² F02C 3/26, 7/26

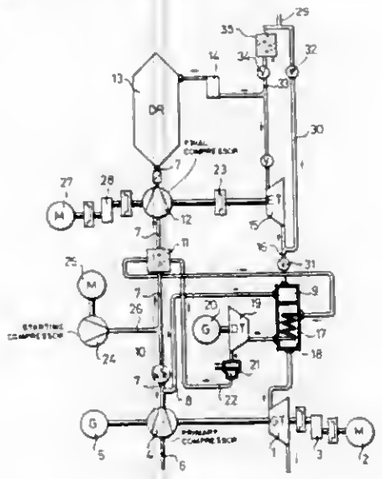
U.S. Cl. 60—39.04 9 Claims

1. A method of starting up a generating plant, a generator of which is driven by a gas turbine operable by combustion gases produced from gas coming from a carbon pressure reactor, the carbon pressure reactor obtaining the combustion air necessary for its operation from a primary compressor driven by the gas turbine and a final compressor connected at the outlet side of the primary compressor and driven by an external power source and an expansion turbine connected between the pressure reactor and a combustion chamber which produces the combustion gases, said plant having a starting compressor for providing combustion air to the final compressor during start up, said method comprising the steps of:

energizing the starting compressor to compress auxiliary air for the carbon pressure reactor;

energizing the final compressor with the external power source independently of the expansion turbine to further compress the auxiliary air and provide same to the carbon pressure reactor;

operating the carbon pressure reactor responsive to the supply of compressed auxiliary air to produce combustible gases;



accelerating the expansion turbine toward operating speed with the combustible gases;

supplying the combustible gas to the combustion chamber when the quantity of gas produced exceeds a predetermined level and burning it there to produce combustion gases;

driving the gas turbine and primary compressor with the combustion gases from the chamber;

deenergizing the starting compressor; and

transferring the energization of the final compressor from the external power source to the expansion turbine in accordance with the supply of combustible gases from the carbon pressure reactor.

4,028,884

CONTROL APPARATUS FOR CONTROLLING THE OPERATION OF A GAS TURBINE INLET GUIDE VANE ASSEMBLY AND HEAT RECOVERY STEAM GENERATOR FOR A STEAM TURBINE EMPLOYED IN A COMBINED CYCLE ELECTRIC POWER GENERATING PLANT

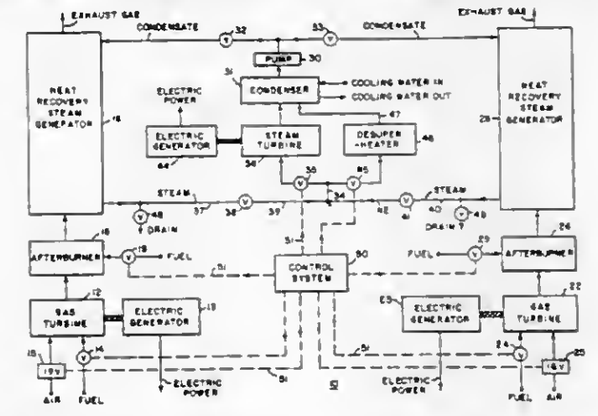
Lyle F. Martz, Verona; Jack R. Smith, Pittsburgh; Francis A. Lebonette, Swarthmore; Robert A. Putnam, Elverson, and Paul A. Berman, Plymouth Meeting, all of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Dec. 27, 1974, Ser. No. 537,036

Int. Cl.² F02C 7/02

U.S. Cl. 60—39.18 B 14 Claims

1. A load control system for a combined cycle electric power plant including a gas turbine having an exit through which heated exhaust gases pass, a variable inlet guide vane assembly for controlling the flow of air to said gas turbine and actuating means therefor, means for generating steam coupled to said gas turbine exit for transferring heat from the exhaust gases to a fluid passing through said steam generating means, a steam turbine coupled to said steam generating means and driven by the steam by the steam supplied thereby, means for generating electric power by the driving power of each of said turbines, an afterburner for supplying additional heat to the exhaust gases passing from said gas turbine to said steam generating means, and valve means for controlling the fuel flow to said afterburner, said load control system comprising means for controlling the fuel flow to said gas turbine in response to inputs including a plant load demand to provide for plant load changes between gas turbine minimum load and gas turbine base load at a relatively fast rate limited by gas turbine limitations until minimum afterburner firing occurs and at a slower rate limited by steam turbine limitations after minimum afterburner firing, means for controlling the position of said



afterburner fuel valve means to provide steam under predetermined temperature conditions as the gas turbine loading is increased at the gas turbine limited rate between the gas turbine minumum load and a first higher gas turbine load at and above which minimum afterburner firing occurs, means for controlling the position of the gas turbine inlet guide vanes, and means for controlling the flow of steam to said steam turbine in a follow mode.

4,028,885

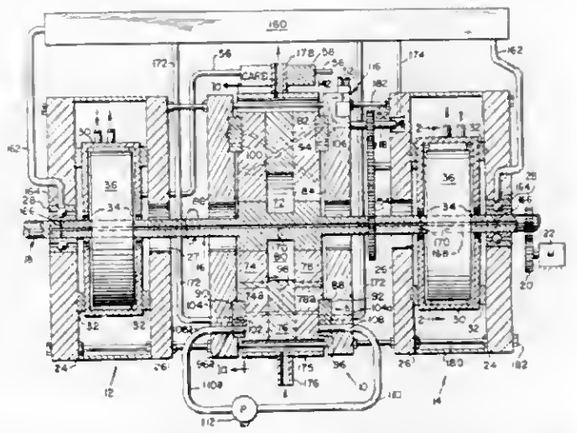
ROTARY ENGINE

Thomas J. Ganley, 46-08 195th St., Flushing, Queens County, N.Y. 11358, and Eamon P. Cronin, 116 Prospeck Park West, Brooklyn, N.Y. 11215

Continuation-in-part of Ser. No. 163,020, July 15, 1971, abandoned. This application Apr. 22, 1974, Ser. No. 463,132

Int. Cl.² F02C 5/06

U.S. Cl. 60—39.75 13 Claims



1. A rotary engine comprising a stationary housing for having a drive rotor and a compressor, a drive shaft journalled in said housing concentrically mounting said drive motor for rotation therewith, said drive rotor comprising at least one rotating plate having a plurality of separate transverse holes extending the entire width of said drive rotor, a rotary compressor mounted on said drive shaft for rotation therewith near said drive rotor, a source of combustible fluid, means connecting said source of combustible fluid with said rotary compressor for directing said combustible fluid to said one rotary compressor, feed means mounted between said rotary compressor and said drive rotor for sequentially feeding discrete portions of said combustible fluid from said one rotary

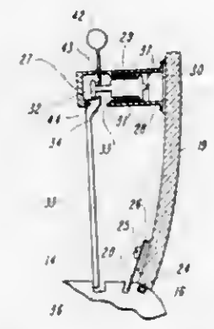
compressor to said drive rotor in timed relationship with the passage of predetermined ones of said holes of said drive rotor, means for igniting the discrete portions of said combustible fluid prior to reaching the associated one of said holes of said drive rotor, said feed means comprising a collector chamber having one movable wall for varying the volume of said collector chamber, a rotatable hollow control shaft having at least one opening formed on the circumference thereof for allowing compressed combustible fluid stored in said collector chamber to enter into the interior of said hollow control shaft upon the alignment of said at least one opening with said collector chamber, first gear means mounted about said hollow control shaft and second gear means mounted about said drive shaft near said first gear means and meshing therewith, whereby the rotation of said hollow control shaft is controlled in timed relation with said drive shaft so that compressed combustible fluid is supplied to said means for igniting in timed sequence, conduit means connecting said means for igniting said combustible fluid with said drive rotor for delivering the ignited fuel to said predetermined ones of said holes rotatably driving said drive rotor, means for lubricating said drive rotor, said drive shaft, and said at least one rotary compressor, and housing means housing said drive rotor and said rotary compressor.

4,028,886

PASSIVE CHAMBER WALL FRAGMENTER

Robert D. Hackett, Florissant, Mo., assignor to McDonnell Douglas Corporation, St. Louis, Mo.

Filed Oct. 23, 1975, Ser. No. 624,784
Int. Cl.² F02K 9/04, 7/10
U.S. Cl. 60—245 **10 Claims**



1. In a chamber separator wall fragmenter, the combination of a body having adjacent chambers subject to different pressure conditions, a separator wall positioned in said body to interrupt communication between said body chambers, releasible means engaged with one surface of said separator wall and with the surface of one chamber, release by said releasible means permitting said separator wall to move bodily into the other of said adjacent chambers, and means carried by said separator wall in position to fragment said separator wall upon predetermined bodily movement thereof into said other chamber.

4,028,887

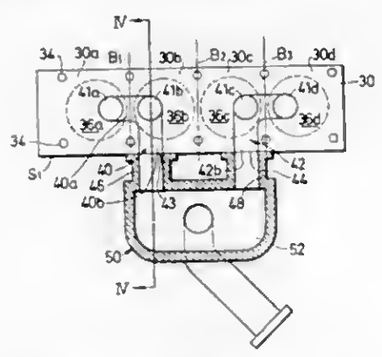
INTERNAL COMBUSTION ENGINE WITH IMPROVED EXHAUST PORT

Saburo Tsutsumi, Yokohama, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Mar. 12, 1976, Ser. No. 666,317
Claims priority, application Japan, Mar. 15, 1975, 50-31571
Int. Cl.² F01N 3/00
U.S. Cl. 60—282 **14 Claims**

1. An internal combustion engine having two cylinders in the cylinder block of the engine, comprising:

a cylinder head secured to the top portion of the cylinder block by head bolts and defining at bottom portion thereof two combustion chambers which are respectively communicated with the two cylinders, said cylinder head having an exhaust port formed therein, said exhaust port including a first portion connectable between said two combustion chambers and a second portion connecting at one end thereof to the first portion and at the other end thereof opening to a longitudinal side of said cylinder



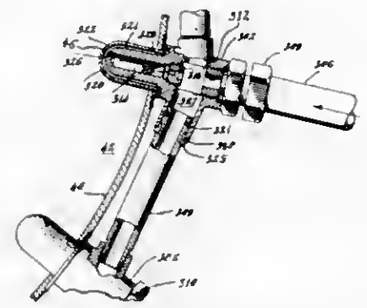
head for forming an opening through which the exhaust gases are emitted out of the cylinder head, the opening being located at one of the two portions of the cylinder head which two last mentioned portions are separated by an imaginary intermediate vertical plane, perpendicular with respect to the longitudinal axis of the cylinder head, between the adjacent two combustion chambers.

4,028,888

FUEL DISTRIBUTION MANIFOLD TO AN ANNULAR COMBUSTION CHAMBER

Karol Pilarczyk, Loudonville, N.Y., assignor to Norwalk-Turbo Inc., Latham, N.Y.

Division of Ser. No. 466,877, May 3, 1974. This application Apr. 25, 1975, Ser. No. 571,791
Int. Cl.² F02C 7/22
U.S. Cl. 60—39.32 **3 Claims**



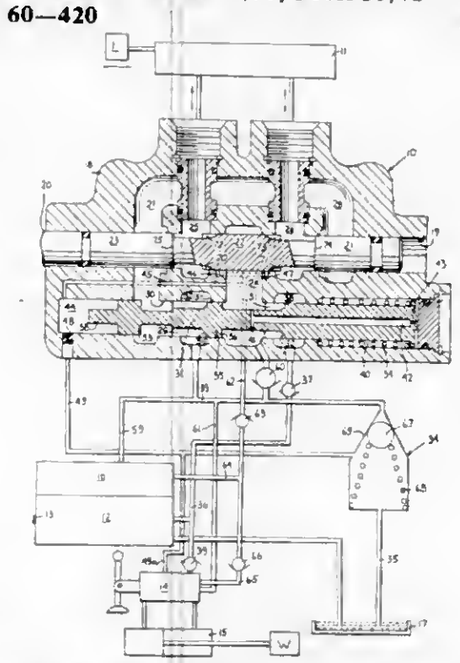
1. A fuel distribution manifold system for feeding fuel to an annular combustion chamber of a gas turbine comprising an assembly of a plurality of individually removable fuel nozzles positioned about the periphery of the combustion chamber, fuel distributing tubes interconnecting the adjacent fuel nozzles for passage of fuel between the removable fuel nozzles, nozzle coupling means integrally formed with the nozzles for slidably receiving the ends of the fuel distributing tubes for sliding movement of the fuel distributing tubes along their longitudinal axes while the nozzles remain in position to permit the ready removal of any individual nozzle means in the assembly by disconnecting it from interconnection with adjacent nozzles without disturbing any other nozzle in the assembly, each nozzle coupling means including two oppositely disposed annular flange means to receive, in sliding arrangement, the ends of fuel distributing tubes, at least one of the annular flange means having sufficient length to allow sufficient sliding movement of the end of the tube received thereby so that the opposite end of the same tube disengages the annular flange means of an adjacent fuel nozzle, and means for feeding fuel to the assembly.

4,028,889

LOAD RESPONSIVE FLUID CONTROL SYSTEM

Tadeusz Budzich, 80 Murwood Drive, Moreland Hills, Ohio 44022

Continuation-in-part of Ser. Nos. 559,818, March 19, 1975, Pat. No. 3,984,979, and Ser. No. 655,561, May 2, 1976. This application Oct. 5, 1976, Ser. No. 729,696
Int. Cl.² F15B 11/16; F16H 39/46
U.S. Cl. 60—420 **26 Claims**



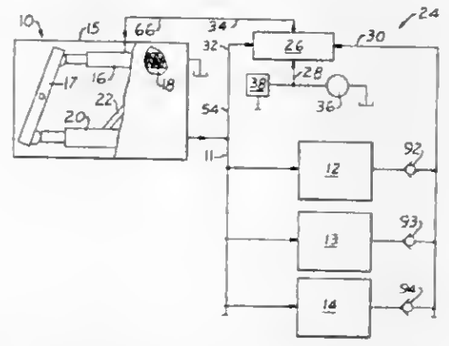
1. Multiple load responsive valve assemblies each comprising a housing having a fluid inlet chamber connected to pump means, a fluid supply chamber, first and second load chambers, outlet fluid conducting means, and fluid exhaust means connected to reservoir means, first valve means for selectively interconnecting said fluid load chambers, said fluid supply chamber and said fluid exhaust means, pressure sensing port means selectively communicable with said load chambers by said first valve means, variable metering orifice means responsive to movement of said first valve means and operable to throttle fluid flow between said fluid supply chamber and said load chambers, second valve means having inlet fluid throttling and fluid isolating means between said fluid inlet chamber and said fluid supply chamber, said second valve means responsive to pressure differential acting across said variable orifice means, fluid replenishing means to interconnect for fluid flow said fluid supply chamber and said fluid exhaust means when said fluid isolating means isolates said fluid supply chamber from said fluid inlet chamber and third control valve means connected to said inlet chambers of said valve assemblies, control line means interconnecting said third control valve means with said control signal passage means of said valve assemblies, control signal direction phasing means in each of said control line means, said third control valve means responsive to highest pressure in any of said load chambers of valve assemblies operating loads and operable to vary fluid flow delivered from said pump means to said load system to maintain a constant pressure differential between pressure in said inlet chambers and said maximum pressure in said load chamber.

4,028,890

PISTON PUMP ASSEMBLY UTILIZING LOAD PRESSURE CONTROL

Cyril W. Habiger, and Donald L. Hopkins, both of Joliet, Ill., assignors to Caterpillar Tractor Co., Peoria, Ill.

Filed Jan. 23, 1976, Ser. No. 651,887
Int. Cl.² F04B 1/26
U.S. Cl. 60—443 **6 Claims**



1. In a piston pump assembly having a housing, an angularly adjustable swash plate for controlling the volume of fluid discharging from the pump to work element, a servo valve having a biasing means and being positioned in contact with the swash plate at a location sufficient for biasing the swash plate toward one of a maximum or minimum fluid discharge position, and means positioned in contact with the swash plate at a location sufficient for biasing the swash plate toward the other fluid discharge position, said means being in communication with fluid discharging from the pump for biasing the swash plate in response to the pressure of the discharging fluid, the improvement comprising:

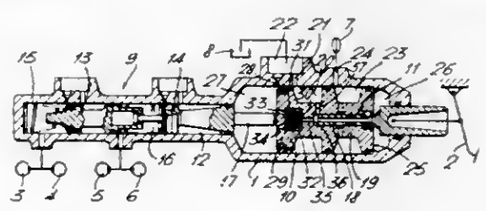
control means for imparting a resultant biasing force directly onto the servo valve of the swash plate for biasing the swash plate through the servo valve in response to the resultant biasing force, said resultant biasing force being a substantially constant pressure control fluid stream as modified by a load pressure acting in opposition to fluid discharging from the pump.

4,028,891

BOOSTER BRAKE UNIT

Juan Belart, Walldorf, Germany, assignor to ITT Industries, Inc., New York, N.Y.

Filed Nov. 7, 1975, Ser. No. 630,116
Claims priority, application Germany, Dec. 23, 1974, 2461295
Int. Cl.² B60T 13/16
U.S. Cl. 60—550 **10 Claims**



6. A booster brake unit comprising:

a master cylinder having a longitudinal axis;

at least one master-cylinder piston having a given diameter disposed in said master cylinder coaxial of said axis;

a booster housing connected to said master cylinder coaxial of said axis;

a booster piston disposed in said booster housing coaxial of said axis for displacing said master-cylinder piston, said booster piston having a diameter greater than said given diameter and an actuation surface at one end thereof remote from said master-cylinder piston;

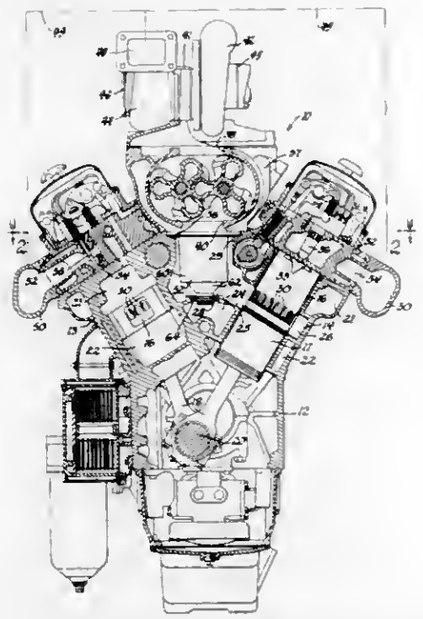
a pressure source;
a brake pedal;
a pressure-control valve coupled between said source and said actuation surface, said pressure-control valve being coupled to said brake pedal to control pressure applied to said actuation surface from said source by said brake pedal;
a pressure chamber disposed within said booster housing coaxial of said axis between adjacent ends of said master-cylinder piston and said boster piston for hydraulic transmission of the force of said booster piston to said master-cylinder piston;
a feed chamber disposed in a wall of said booster housing;
a two-position valve; and
a connection within said booster housing connecting said pressure chamber to said feed chamber via said two-position valve;
said two-position valve being held in a closed position by the force of a spring and said pressure of said source;
said two-position valve including
a spring-loaded member disposed in said booster piston adjacent the other end thereof coaxial of said axis, said member being in pressure communication with said pressure chamber on one side thereof and said valve on the other side thereof.

4,028,892

TURBOCHARGED TWO-CYCLE ENGINE WITH POSITIVE BLOWER AND INTERNALLY MOUNTED AFTERCOOLER

Stanley J. Hinkle, Union Lake, Mich., assignor to General Motors Corporation, Detroit, Mich.

Continuation-in-part of Ser. No. 504,089, Sept. 9, 1974, abandoned. This application Jan. 10, 1975, Ser. No. 540,122
Int. Cl.² F02B *29/04, 33/38, 75/02*
U.S. Cl. 60—599 **1 Claim**



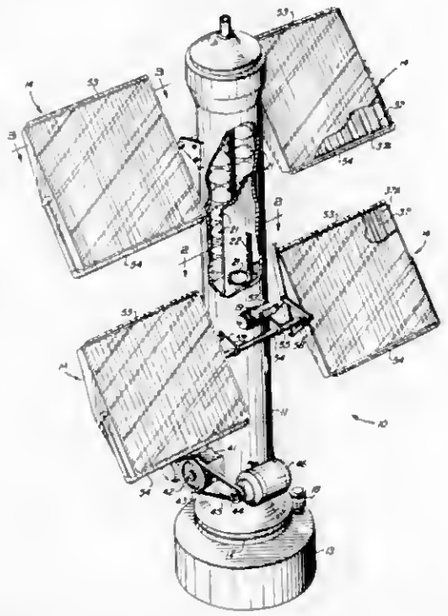
1. A two-cycle diesel engine including a cylinder block,
a plurality of cylinders in said block arranged in two angularly disposed banks, said cylinders having air inlet ports intermediate the ends thereof, said block defining an air chamber adjacent said inlet ports and extending around said cylinders and between said banks above a bottom wall, and a coolant chamber extending around said cylinders and beneath said air chamber bottom wall between said cylinders,
cylinder heads mounted one on each of said banks and closing the ends of said cylinders, said heads having valve controlled exhaust ports connecting with each of said cylinders,
a crankshaft carried for rotation in said cylinder block,
pistons reciprocably disposed in said cylinders and connected with said crankshaft for delivery of power thereto,
a positive displacement blower mounted on said block between said heads and connected with said crankshaft for rotation therewith, said blower having an outlet connected to deliver air directly to said block defined air chamber and operative to supply air thereto upon rotation of said crankshaft,
a turbocharger including a turbine connected with said exhaust ports and a dynamic compressor driven by said turbine and connected to supply pressurized air to said positive displacement blower, and the improvement comprising
an aftercooler mounted in said block beneath said blower at its outlet and within said air chamber to receive air from said blower, said aftercooler being connected with said coolant chamber to receive engine coolant therefrom to cool the air passing from said blower to said air chamber, said after-cooler including a plurality of airflow passages and a plurality of coolant passages arranged in heat exchange relation with said air passages, said airflow passages having a total cross-sectional area not greater than that of said blower outlet so as to provide a high airflow velocity in said air passages to obtain efficient heat transfer and avoid plugging, said air passages being directed toward said bottom wall and terminating thereabove such that the outlet air is directed against said bottom wall for further cooling and then outwardly toward said cylinders, the space between said bottom wall and the ends of said aftercooler passages being small enough to maintain an airflow velocity in said space adequate to prevent pressure pulsations at the cylinder ports from causing flow reversals in the portion of the air chamber under the cooler, thereby avoiding backflow of carbon and other foreign matter from the cylinders to the aftercooler.

4,028,893

OPEN CYCLE SOLAR ENERGY SYSTEM UTILIZING BUOYANCY AS A CONVERSION FORCE

John B. Shaw, 1812 E. Marlette, Phoenix, Ariz. 85016

Filed Apr. 3, 1975, Ser. No. 564,763
Int. Cl.² F03G *7/02*
U.S. Cl. 60—641 **8 Claims**



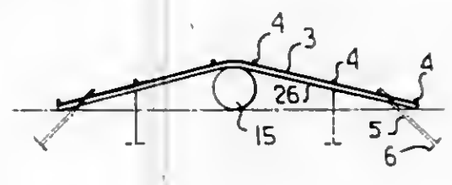
1. A method of generating mechanical movement from the buoyancy effect of a gas comprising the steps of:
compressing a relatively low temperature gas in a sequence of containers as they move from substantially the top to substantially the bottom of a conveyor through a substantially vertically positioned first liquid containing column means,
removing most of the heat energy of compression from the gas as it is being compressed in its movement from the top to the bottom of the first liquid,
extracting the compressed gas from the first liquid containing column means,
adding heat energy to said gas, and
injecting the compressed and heated gas into a second liquid containing column adjacent its base and into a sequence of interconnected gas retaining containers mounted on an endless conveyor positioned in said second column longitudinally of its length and moving from the bottom to the top of said second liquid containing column,
said gas buoyantly expanding in the containers casuing said containers and said endless conveyor to move around a fixed path thereby generating useful mechanical movement, and
releasing the expanded gas from said containers at a substantially topmost point along the fixed path of movement of the conveyor to atmosphere.

4,028,894

APPARATUS FOR PREVENTING EROSION OF THE SEABED IN FRONT OF HYDRAULIC STRUCTURES

Ole Fjord Larsen, 62-Fasanvaengent P.O. Box 604 DK 6700, Eshjerg, Denmark

Filed Aug. 14, 1975, Ser. No. 604,837
Int. Cl.² E02B *3/04*
U.S. Cl. 61—3 **7 Claims**



1. A device for producing and protecting deposits of sedimentary material on the floor of a body of water and specifically preventing the undermining of an elongated marine structure, said device including at least a single longitudinally extending sheet, said single longitudinally extending sheet being composed of at least two layers of perforate material, means joining said layers together at selected points, and said single longitudinally extending sheet having first and second opposite longitudinally extending side portions, a first of said longitudinally extending side portions being contiguous of said elongated marine structure remote from said floor, a second of said longitudinally extending side portions being contiguous of said elongated marine structure adjacent said floor, said sheet diverging in a direction toward said floor away from said elongated marine structure at an angle to said floor of between generally 10–30 degrees, means for maintaining said side portion so positioned relative to said floor, and an uppermost of said layers being taut relative to a looser lowermost of said layers whereby relative upward movement of the lowermost layer toward the upper most layer is permitted.

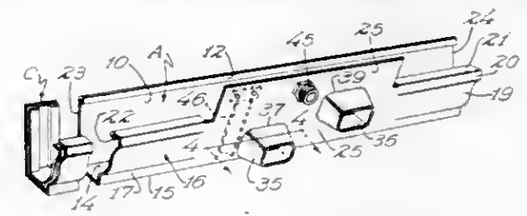
4,028,895

RAIN GUTTER ATTACHMENT

Alvin W. Franzmeier, 1042 E. Jenks Ave., St. Paul, Minn. 55106

Filed Nov. 14, 1975, Ser. No. 631,819
The portion of the term of this patent subsequent to June 17, 1992, has been disclaimed.
Int. Cl.² E02B *9/04;* **E04D** *13/06*
U.S. Cl. 61—14 **10 Claims**

1. An attachment for a rain gutter of substantially uniform cross section and including an inner side adapted for attachment to the eaves of a building, a bottom side, and an outer side of other than flat form, said attachment including a gutter section including end portions conforming to the cross sectional shape of the rain gutter, and a flat central portion on the outer side of said attachment, said flat central portion having



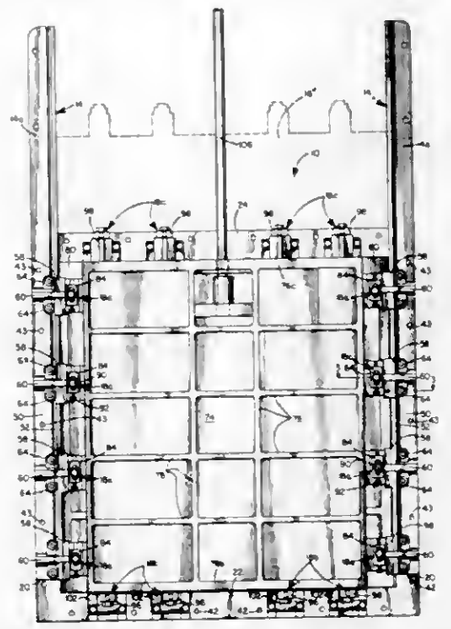
a pair of spaced apertures extending therethrough, one of said apertures being adjacent to the bottom wall of said attachment and the other aperture being above the level of, and offset from, the first mentioned aperture.

4,028,896

SLUICE GATE ASSEMBLY

George E. Whipps, Athol, Mass., assignor to Rodney Hunt Company, Orange, Mass.

Filed Mar. 4, 1976, Ser. No. 663,842
Int. Cl.² E02B *7/28*
U.S. Cl. 61—28 **5 Claims**



1. A sluice gate assembly comprising in combination: an integrally cast frame surrounding an opening and having a generally L-shaped cross-section defined by coplanar side, bottom and top flange sections with inner side, bottom and top walls protruding from the inner edges thereof, the inner side walls on said side flange sections extending along opposite sides of said opening, with a plurality of spaced bosses on said frame at the juncture between said inner side walls and said side flange sections; a pair of elongated guide members having base and guide flanges, said base flanges being secured to the upper surfaces of said bosses, said guide flanges having guide grooves formed exclusively thereon and extending along opposite sides of said opening and above said opening along upper sections of said guide members which upper sections protrude above said frame; a gate disc having side edges received in sliding engagement in said guide grooves, said gate disc being movable between an open position in part at least above said opening and closed position lying across said opening; and, wedge members on said gate disc cooperating with seat members on said frame and said guide members for wedging said gate disc into sealing engagement with said frame when said gate disc is in said closed position.

4,028,897

SOIL STABILIZATION COMPOSITION

Donald Alfred Bennett, Nailsworth, England, assignor to The International Synthetic Rubber Company, Limited, Southampton, England

Filed June 7, 1976, Ser. No. 693,929

Claims priority, application United Kingdom, June 10, 1975, 24806/75

Int. Cl.² E02D 3/12

U.S. Cl. 61—36 C 8 Claims

1. A process for stabilisation of soil or other particulate matter which comprises applying a composition formed from a natural or synthetic rubber latex, of solids content at least 40% by weight, and a compatible oil characterised in that the composition is prepared by admixing the oil and the latex in the presence of a non ionic surfactant as additional emulsifier and in the substantial absence of added water.

4,028,898

PIT PROP ASSEMBLY

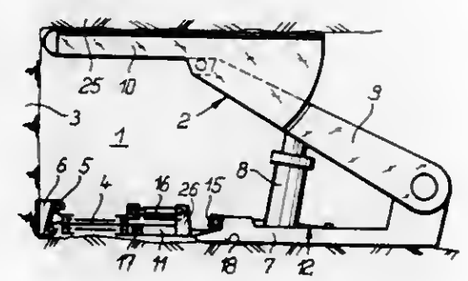
Günter Blumenthal, Westerholt, and Hans-Ferdinand Bemmerl, Herne, both of Germany, assignors to Bochumer Eisenhutte Heintzmann & Company, Bochum, Germany

Filed May 11, 1976, Ser. No. 685,163

Claims priority, application Germany, May 17, 1975, 2522117

Int. Cl.² E21D 15/44

U.S. Cl. 61—45 D 15 Claims



1. In a mining assembly comprising: a face conveyor extending along a mine floor; an elongated slide defining a longitudinal direction transverse to the direction of extension of said conveyor and having a front end pivoted on said face conveyor and a rear end turned away from said face conveyor; a pair of pit props having floor-engaging elongated bases flanking said slide and each having a front end turned said conveyor and a rear end turned away from said conveyor; displacement means including a longitudinally extending fluid-operated ram pivoted on said front ends of said bases and on said rear end of said slide for longitudinally relatively displacing said slide and said bases, whereby when said face conveyor is fixed said ram can longitudinally displace said props and when said props are fixed said ram can longitudinally displace said conveyor; and positioning means on said front end of said slide and connected to said face conveyor for vertically displacing said conveyor relative to said front end of said slide, whereby upward displacement of said conveyor by said positioning means urges said front end of said slide downwardly and said rear end of said slide upwardly and downward displacement of said conveyor by said positioning means urges said front end of said slide upwardly and said rear end of said slide downwardly, the improvement wherein each of said bases has at its rear end a side turned toward said slide and said slide has at its rear end opposite lateral sides each turned toward and forming a pair with the confronting side of the respextive base, each pair of confronting sides having interengaging formations one of which engages over and under the formation of the other side of the respective pair, one of said formations being elongated in said longitudinal direction.

4,028,899

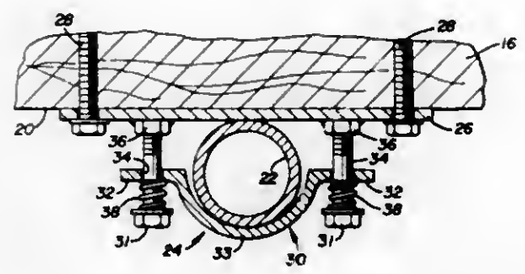
ANCHORING SYSTEM FOR A FLOATING DOCK

Daniel A. Carmichael, III, P.O. Box 112, Cedarville, Mich. 49719

Filed Jan. 14, 1976, Ser. No. 648,976

Int. Cl.² E02B 3/20

U.S. Cl. 61—48 1 Claim



1. In combination; a bouyant floating dock having a substantially horizontal deck and opposite, vertical side walls; a pair of relatively spaced apart parallel and substantially stationary cylindrical piles extending vertically upwardly and closely adjacent the opposite side walls of said dock; vertically elongated substantially flat bearing plates secured to the respective side walls of said dock and arranged for vertically extended line contact with said piles along one side thereof; vertically elongated clamps having inner arcuate bearing surfaces of greater radius of curvature than the cylindrical surface of said piles and disposed in vertically extended line contact with said piles along the sides thereof opposite said bearing plates; and means connecting said clamps with said bearing plates and for maintaining said clamps and bearing plates in sliding, line contact with said piles, said bearing plates and clamps permitting said dock to rise and fall between said piles with gradual changes in water level while holding said dock against rocking movement in response to wave action.

PILE WITH A FOOT

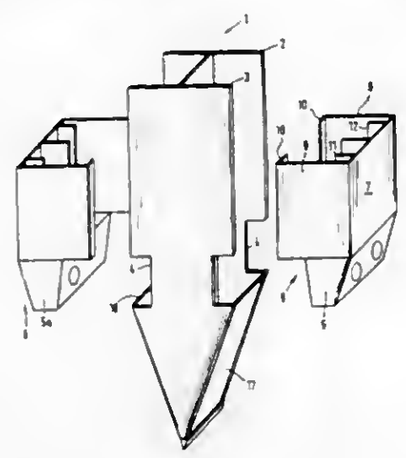
Günther Müller, 3550 Marburg, L-Wehrda, Germany

Filed Feb. 24, 1976, Ser. No. 660,984

Claims priority, application Germany, Feb. 24, 1975, 2507903

Int. Cl.² E02D 5/54

U.S. Cl. 61—53 8 Claims



1. A piling pole for driving into the ground, said piling pole comprising in combination:

an elongate pole terminating at its end to be driven into the ground in a generally wedge-shaped portion; displacement means for laterally displacing ground penetrated upon driving of the pole, said displacement means including at least two parts complementarily shaped and surrounding the pole radially spaced apart therefrom and to be parallel to the lateral surfaces of said wedge-shaped end of the pole; mounting means connecting said displacement parts and securing the same to the pole adjacent to the wedge-shaped end thereof, said mounting means including oppositely disposed cut-outs in the pole adjacent to the wedge-shaped end thereof; and protrustions on said parts inserted into said cut-outs and retained therein.

4,028,901

METHOD AND APPARATUS FOR ASSEMBLING SHEET PILING

Stanley Barber, 3310 S. 27th St., Fort Smith, Ark. 72901

Continuation-in-part of Ser. No. 532,218, Dec. 12, 1974, abandoned. This application Nov. 19, 1975, Ser. No. 633,466

Int. Cl.² E02D 13/04

U.S. Cl. 61—63 19 Claims

1. A method of connecting a loose sheet piling section to a set sheet piling section standing in an upright position, said loose and set piling sections having mating longitudinal margins adapted to telescopically interlock, said method comprising the steps of:

positioning the loose piling section longitudinally alongside the set piling section;

positioning securely a gripping mechanism to the upper end of the set piling section;

engaging continuously and rotatively the loose piling section with said gripping mechanism at a location above the top end of the set piling section to retain the margin of the loose piling section in close proximity to the margin of the set piling section and to permit longitudinal displacement of the loose piling section.

raising longitudinally the loose piling section above the set piling section as the loose piling section is positionally maintained adjacent the upper end of the set piling section by said gripping mechanism;

shifting the loose piling section laterally to vertically align the margin thereof above the mating margin of the set piling section after the bottom end of the loose piling section has cleared the top end of the set piling section; and

lowering the loose piling section to interlock the margin thereof with the margin of the set piling section.

4,028,902

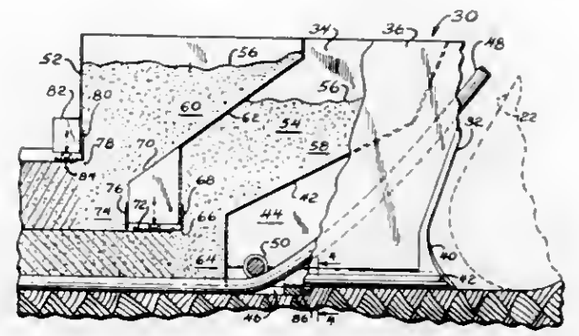
APPARATUS FOR LAYING ELONGATED FLEXIBLE TUBING

Thomas G. Courson, Mansfield; William L. Schlueter, Rantoul, and Thomas T. Kelly, Champaign, all of Ill., assignors to Central Illinois Tile co., Champaign, Ill.

Filed Oct. 1, 1976, Ser. No. 728,556

Int. Cl.² E02F 5/10; E02B 11/00

U.S. Cl. 61—72.6 7 Claims



1. Apparatus for laying elongated flexible tubing in a trench adapted to be secured to a trenching boom carried by a vehicle, said apparatus comprising:

an upwardly open hopper having a forward end adapted to be secured to a trenching boom in trailing relation thereto, and a trailing end;

a first partition adjacent said forward end defining a flexible tubing tunnel, said tunnel opening to the top and bottom of said hopper so that flexible tubing may enter the top of said hopper and exit the bottom thereof behind said trenching boom;

a second partition in said hopper rearwardly of said first partition defining first and second fill material receiving compartments, said compartments opening upwardly to receive fill material such as sand and downwardly to release fill material rearwardly of said tunnel, said second compartment opening downwardly at a level above the downward opening of said first compartment;

a first compactor carried by said hopper rearwardly of said first compartment and forwardly of said second compartment for compacting fill material released from said first compartment;

a second compactor carried by said hopper rearwardly of said second compartment for compacting fill material released from said second compartment; and

a groover carried by said hopper at the bottom thereof forwardly of said tunnel for cutting a groove in the bottom of the trench dug by the trenching boom to which said apparatus may be attached, said groover being configured to cut a groove having a cross section substantially equal to that of the lower third of the flexible tubing being laid.

4,028,903

METHOD AND APPARATUS FOR MANEUVERING PIPE ENDS IN A SUBSEA LOCATION

Dave S. Dietrich, Magnolia, Tex., assignor to HydroTech International, Inc., Houston, Tex.

Filed Nov. 12, 1975, Ser. No. 631,101

Int. Cl.² B23P 19/04

U.S. Cl. 61—110 10 Claims

1. In a method of maneuvering onto general axial alignment the ends of two axially spaced apart pipes supported on the seabottom under a body of water, the combination of steps comprising;

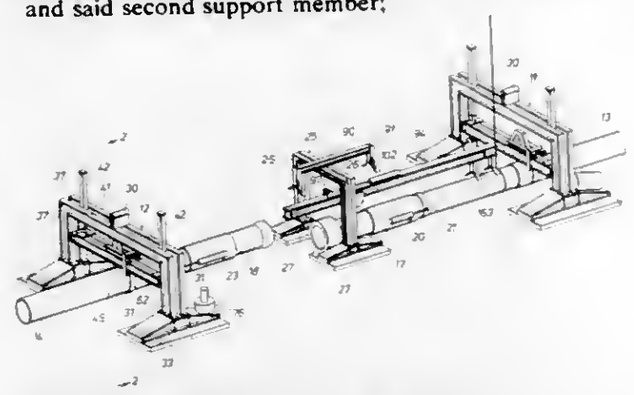
mounting a first support frame adjacent to one of said pipe and supporting said first frame on said seabottom;

securing connecting means between said one pipe and said first support frame;

raising said one pipe by applying a lifting force to said connecting means;

mounting a separate second support frame adjacent to the other of said pipes and supporting said second frame on said seabottom, said second support frame being independent of and axially spaced apart from said first frame;

securing another connecting means between said other pipe and said second support member;



raising said other pipe by applying a lifting force to said other connecting means;

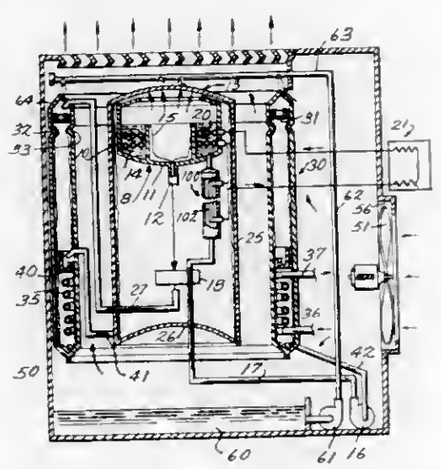
and moving said pipe ends laterally and vertically relative to each other while said pipes are supported by said frames, to thereby move said pipe ends to positions where the axes of said pipes generally intersect.

4,028,904

PREHEATER FOR WEAK ABSORBENT

Philip P. Anderson, Newburgh, Ind., assignor to Arkla Industries Inc., Evansville, Ind.

Filed Dec. 24, 1975, Ser. No. 644,200
Int. Cl.² F25B *15/06*
U.S. Cl. 62—2 4 Claims



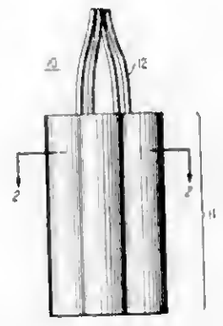
1. In an absorption refrigeration system having a refrigerant condenser, an evaporator, an absorber for absorbing refrigerant vapor from the evaporator into a liquid absorbent to thereby form a relatively cold solution rich in refrigerant, a generator for boiling off refrigerant vapor from the solution obtained from the absorber to thereby form a solution weak in refrigerant, said generator including means for passing a relatively hot stream of heat exchange fluid from a source thereof in heat exchange relationship with the solution in the generator,means for conducting the refrigerant vapor from the generator to the refrigerant condenser, and means for returning the solution weak in refrigerant to the absorber, the improvement which comprises a preheater for passing the solution about to enter the generator in heat exchange relationship with the stream of heat exchange fluid after the latter has left the generator.

4,028,905

PrNi$_5$ AS A CRYOGENIC REFRIGERANT

Klaus Andres, Berkeley Heights, and Paul Herman Schmidt, Chatham, both of N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Oct. 20, 1975, Ser. No. 623,808
Int. Cl.² F25B *21/02*; B01J *23/10*
U.S. Cl. 62—3 9 Claims



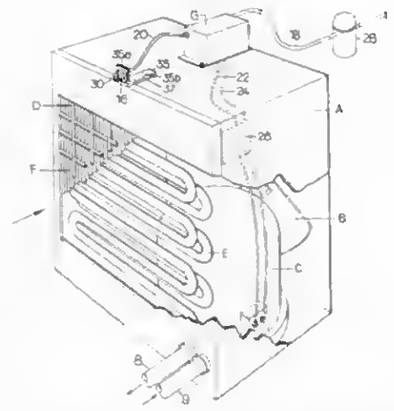
1. A cryogenic cooling sill comprising at least one first body of a refrigerant material, bonded by means of a metallic bonding agent to at least one second body of thermal conductor material extending beyond the first body CHARACTERIZED IN THAT the refrigerant material consists essentially of $PrNi_5$.

4,028,906

FOGGING DEVICE FOR COOLING A CONDENSER COIL

Albert Gingold, Altamont Springs, Fla., and Charles E. Upchurch, Greenville, S.C., assignors to Charles E. Upchurch, Greenville, S.C.

Filed July 14, 1975, Ser. No. 595,379
Int. Cl.² F25B *39/04*
U.S. Cl. 62—183 6 Claims



1. A fogging device for cooling a condenser coil in a central air condition system having an outdoor compressor unit, a housing for said compressor unit containing a fan, an opening in said housing through which a stream of air is created flowing across said condenser coil carried within said housing adjacent said opening and extending thereover, said condenser coil receiving refrigerant fluid from a compressor motor, said device comprising:

a control valve having an inlet port connected to a source of pressurized water;

nozzle means connected to an outlet port of said control valve receiving a flow of water from said source when said is in an open position;

means for moving said control valve to said open position in response to said compressor motor being energized; and

said nozzle means having an opening and orifice formed therein for highly atomizing said water into a mist of finely divided water particles, said nozzle means projecting a metered amount of water in the form of said atomized mist as a fan-shaped curtain across an area substantially coextensive with and adjacent to said housing opening, said curtain of mist being received by said air stream prior to passing across said coil as to be mixed and further atomized therein for fogging and enveloping said condenser coil with said mist;

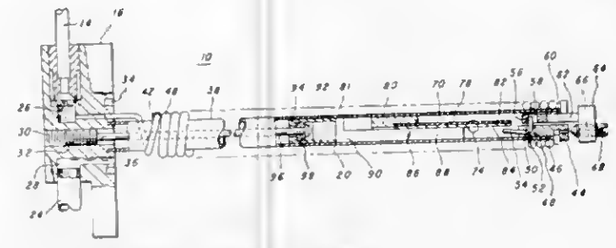
whereby said mist of minute water particles adheres more readily to said coil and is more effectively and completely evaporated by the heat from said condenser coil, cooling said coil more efficiently while reducing the amount of residual runoff water.

4,028,907

ADJUSTABLE-JOULE-THOMSON CRYOGENIC COOLER WITH DOWNSTREAM THERMAL COMPENSATION

Rodney E. Herrington, Dallas, and Carol O. Taylor, Anna, both of Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Filed Dec. 15, 1975, Ser. No. 640,524
Int. Cl.² F25B *41/04*
U.S. Cl. 62—222 12 Claims



1. A cryogenic cooler comprising:

a. source of cryogen;

b. a heat exchanger connected to the source of cryogen;

c. a valve means attached to the heat exchanger for controlling the flow of cryogen from the heat exchanger;

d. an expansion chamber having a cold end, a body portion and a hot end, said cold end connected to the heat exchanger for receiving and expanding the cryogen flowing from the heat exchanger, said body portion having a length sufficient to receive the flowing cryogen for absorbing heat from the heat exchanger to form a thermal gradient between the cold and hot ends, and said hot end formed at the hot end of the body portion for venting the heated cryogen; and

e. a thermal compensation mechanism positioned downstream of the cold end at a preselected location in the body portion of the expansion chamber, said thermal compensation mechanism connected to the valve means for actuating the valve means responsively to a selected temperature of the thermal gradient whereby the thermal compensation mechanism is independent of the pressure forces at the cold end of the expansion chamber and the cold end is maintained at a substantially constant preselected temperature.

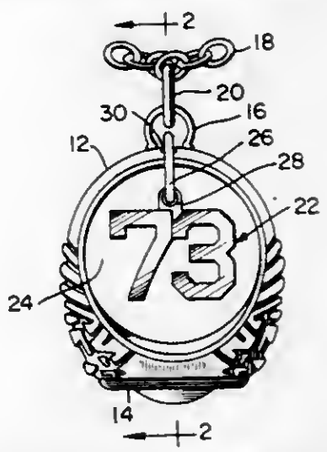
4,028,908

SCHOOL RING CHARM WITH DANGLING SCHOOL INDICIA

John Graham Michael, c/o Brown Wholesale Company, 2095 N. 63rd St., Wynnewood, Pa. 19151

Filed Feb. 21, 1974, Ser. No. 444,335
Int. Cl.² A44C *25/00*
U.S. Cl. 63—23 10 Claims

1. A school ring charm comprising a school ring having a shank and a ring top defining a finger aperture, display means on the ring for displaying information of school-related significance, dangling means for making eye-catching movement in said finger aperture, and mounting means for dangling said dangling means within the finger aperture of said ring, said dangling means being framed and protected in the finger aperture by the ring shank and top to permit said dangling eye-catching movement, said mounting means being connected to said ring shank at a central location thereof to support said dangling means so that said dangling means dangles within the finger aperture of said ring when said ring is in



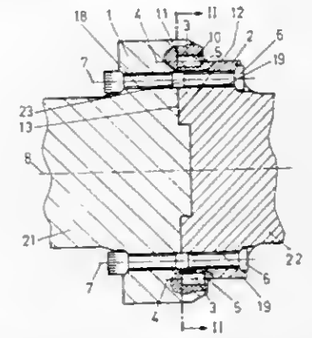
an inverted position with the ring top facing downwardly, said dangling means comprising a dangling member which showcases school indicia.

4,028,909

COUPLING, PARTICULARLY FOR USE IN TURBOGENERATORS

Gojko Jancic, Nussbaumen; Pierre Meylan, Neuenhof, and Alexandre Portmann, Nussbaumen, all of Switzerland, assignors to BBC Brown Boveri & Company Limited, Baden, Switzerland

Filed Oct. 8, 1975, Ser. No. 620,700
Claims priority, application Switzerland, Oct. 25, 1974, 14298/74
Int. Cl.² F16D *8/00*
U.S. Cl. 64—28 R 10 Claims



1. A coupling for connecting together the end of one shaft with the end of another shaft, particularly for use in turbogenerators, comprising:

a large coupling flange fixedly secured to said end of said one shaft;

a small coupling flange fixedly secured to said end of said other shaft;

connecting means for connecting said shafts together and exerting thrust forces upon said coupling flanges, and for transmitting the torques developed during operation,

the free end of said smaller coupling flange being disposed within a bore defined within said larger coupling flange; and

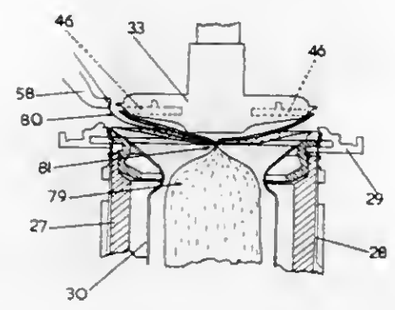
said connecting means comprises a plurality of shear elements extending, in the axial direction of said coupling, within recesses defined within the outer periphery of said small coupling flange and the inner periphery of said large coupling flange and having their longitudinal axes disposed upon a circular locus having a diameter substantially equal to the diameter of said bore and shear areas extending in the axial direction of said shear elements, and a plurality of shearable bolts connecting said two flanges to one another and having axes which define an angle, with the coupling axis, which may be within the range of 0° – 35°.

4,028,910

TUBULAR KNITTED FABRIC

Harry Wignall; William Ewart Alan Shelton, and John Michael Klee, all of Leicester, England, assignors to The Bentley Engineering Company, Ltd., England

Filed Oct. 23, 1968, Ser. No. 769,840
Claims priority, application United Kingdom, Oct. 27, 1967, 48922/67
Int. Cl.² D04B 9/10, 9/40, 9/06
U.S. Cl. 66—26 14 Claims



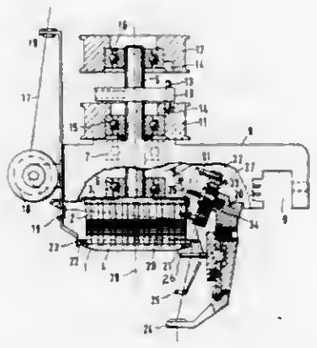
1. A method of knitting an end portion of a tubular knit fabric article using a circular knitting machine, said method comprising knitting an initial portion, knitting a plurality of courses to form a length of tubular fabric while supporting said initial portion above the level of knitting, looping a yarn under tension around said length of tubular fabric while said initial portion is supported to form a constricting loop that confines the portion of said length of tubular fabric thereat to a substantially reduced tubular size, and knitting a subsequent course of said tubular fabric with said initial portion knit therein to form said length of fabric in a two ply construction with an end at which said constricting loop yarn is disposed between said plies.

4,028,911

INCLINED PIN WHEEL FOR YARN STORAGE DRUM

Josef Fecker, Steinhofen-Bisingen, and Gustav Memminger, Freudenstadt, both of Germany, assignors to Firma Gustav Memminger Yerfabrenstechnik fuer die Maschenindustrie, Freudenstadt, Germany

Filed Dec. 19, 1975, Ser. No. 642,655
Claims priority, application Germany, Dec. 28, 1974, 2461746
Int. Cl.² D04B 15/48; B65H 51/20
U.S. Cl. 66—132 R 7 Claims



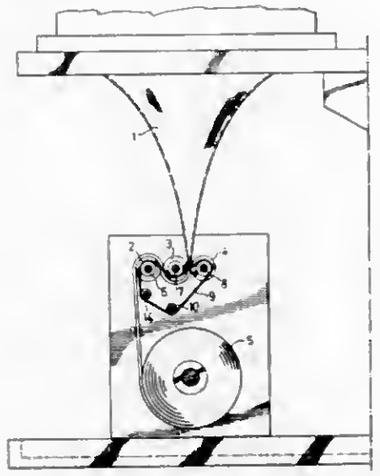
1. Yarn delivery apparatus for textile machines such as a knitting machine having a support (8), a rotatable storage drum (1) journalled on the support to rotate about a driven axis (28) and formed with a corrugated surface for winding thereon a yarn (17) in a plurality of windings to form yarn storage windings (20) upon rotation of the drum, and permitting pull-off of the yarn over an axial end thereof, means (5) rotating said drum,
and means axially moving the storage windings comprising;
a pin-wheel or stub-tooth gear (27) to feed the windings of the yarn about the drum axially thereof, the pin-wheel or stub-tooth gear having projecting pins or teeth (31) extending towards the drum, said wheel or gear having a fixed axis of rotation,
and bearing means (33) freely journalling said pin wheel or stub tooth gear (27) on the support (8) with the axis of rotation (30) thereof being inclined with respect to the axis of rotation (28) of the drum (1) and with the projecting pins or teeth (31) thereof engaging the corrugations of the drum (1)
to provide for free rotation of said pinwheel or stub tooth gear (27) upon engagement with the corrugated surface of the storage drum (1),
the yarn being supplied to the drum (1) beneath the pins or teeth (31) of the pin wheel or stub tooth gear (27).

4,028,912

FABRIC TAKE-UP MECHANISM

Richard Schneck, Deizisan, Germany, assignor to Sulzer Morat GmbH, Bonlanden, Germany

Filed Dec. 17, 1975, Ser. No. 641,652
Claims priority, application Germany, Dec. 27, 1974, 2461638
Int. Cl.² D04B 15/88, 27/34
U.S. Cl. 66—149 R 10 Claims



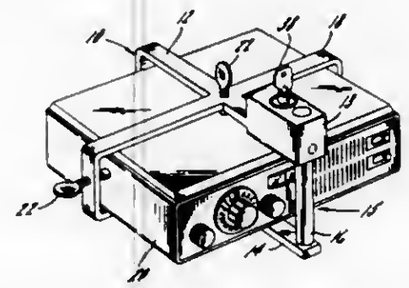
1. A fabric drawing-off mechanism for knitting machines comprising, a first and at least a second draw-off roller, said rollers having parallel axles, a driving means for positively rotating said first and said second draw-off roller, said rollers having parallel axles, a driving means for positively rotating said first and said second draw-off rollers at the same speed; bearing means for at least one of said draw-off rollers, said bearing means providing relative motion between said draw-off rollers in a direction perpendicular to the parallel axles of said rollers during rotation of said rollers, guiding elements fixed to said draw-off rollers, and tightening means for resiliently pressing together said draw-off rollers in said direction, said driving means and said tightening means including a common endless tension member which at least partially passes around said guiding elements, around at least said driving means and around at least one tensioning element so that said tension member will at least drive said second draw-off roller and press both draw-off rollers together so that the distance between said draw-off rollers is variable in dependence on fabrics of varying thicknesses.

4,028,913

CB RADIO LOCKING DEVICE

Sidney Falk, River Grove, Ill., assignor to Fort Lock Corporation, River Grove, Ill.

Filed Aug. 13, 1976, Ser. No. 714,189
Int. Cl.² E05B 73/00
U.S. Cl. 70—58 3 Claims



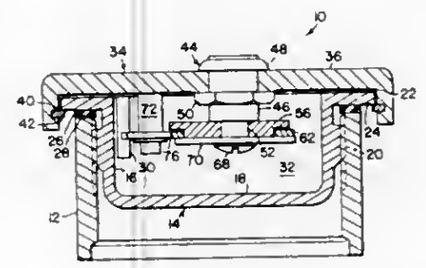
1. A locking device for attachment to a stationary structure of a vehicle for receiving and securing a CB radio and the like comprising, in combination, a frame structure including a C-shaped bar member having first and second free ends with a spaced opening therebetween, a rectangular bar member transversely fixed to said C-shaped bar, one free end of the C-shaped bar including a lock casing having a key actuated lock therein, means defining a transverse passage through said lock casing, a spindle adapted to pass through said lock case passage means and having coupling means at a first end, means disposed in said other free end of the C-shaped bar for receiving said spindle first end coupling means and locking bolt means operated by said key actuated cylinder for securing the spindle to said lock casing.

4,028,914

LOCKABLE CONTAINER SPOUT CLOSURE

Arvid Harlan Saele, and Michael Pier Hutton, both of Dubuque, Iowa, assignors to Deere & Company, Moline, Ill.

Filed June 14, 1976, Ser. No. 695,637
Int. Cl.² B65D 41/04; B67D 5/32; E05B 65/52
U.S. Cl. 70—165 4 Claims



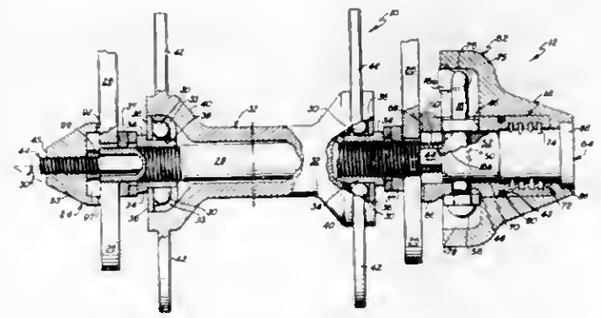
1. In a lockable closure for a container spout including a dished inner cap defined by an upright cylindrical side wall and a bottom wall and having a central axis about which it is adapted for rotation to and from closing relationship relative to an open container spout end, an outer cap completely covering said inner cap and cooperating therewith to define a cavity, connecting means securing the outer cap to the inner cap for preventing separation of one from the other but permitting relative rotation therebetween about the central axis, a key-operable lock mounted in the outer cap and including a cylinder projecting into the cavity and having a key-operable barrel located therein and projecting therethrough into the cavity, a stop means formed integrally with the upright cylindrical side wall of the inner cap and located in said cavity, a lock member, means operatively connecting the lock member to the barrel for radial reciprocation, in response to selected rotation of the barrel, between a lock position wherein it rotates clear of the stop means when the outer cap is rotated and an unlock position wherein it engages its stop means and causes the inner cap to be rotated with the outer cap when the latter is rotated, the improvement comprising: a guide member fixed to the outer cap and projecting into the cavity at a distance from the central axis which is less than the distance the stop means is from the central axis; and said lock member having an elongated guide slot therein and positioned with said guide member located in said guide slot, whereby when the lock member is in its unlock position, the guide member will serve to transmit rotation of the outer cap to the inner cap by way of the locking member.

4,028,915

LEVER ARM LOCK FOR QUICK RELEASE HUB ASSEMBLY

Michael A. Stahl, Miami Beach, Fla., assignor to Far Out Products Ltd., Hollywood, Fla.

Filed Feb. 17, 1976, Ser. No. 658,541
Int. Cl.² B62K 25/00, 25/02
U.S. Cl. 70—233 19 Claims



1. The combination comprising:
a. a quick release mechanism for releasably securing a hub assembly to a vehicle frame member;
b. said mechanism including a lever arm movable between a first position for securing said hub with respect to said frame member and a second position for releasing said hub with respect to said frame member;
c. locking means detachably securable to said mechanism for locking said lever arm in said first position;
d. said hub assembly includes a hub rotatably mounted on an axle;
e. first and second end nuts being located respectively adjacent opposite ends of said axle and spaced apart from said hub for receiving said frame member;
f. said lever arm being operative to adjust a distance between said end nuts; and
g. said locking means is securable to said first end nut with said hub being effective to rotate on said axle.

4,028,916

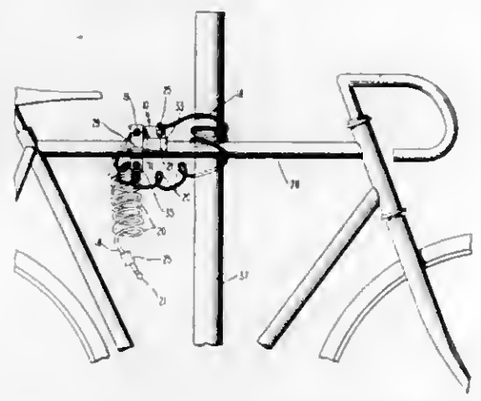
LOCK FOR BICYCLES AND THE LIKE

David R. Pender, 1018 Marion St., Columbia, S.C. 29201

Filed Apr. 13, 1976, Ser. No. 676,636
Int. Cl.² B62H 5/00
U.S. Cl. 70—233 4 Claims

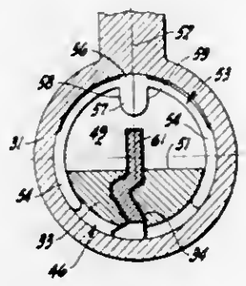
1. In a locking means for a bicycle or the like having a frame member, a key-operated lock unit having a receiver and an active locking element in said receiver, means for securing said lock unit permanently to said frame member, a flexible tether having one end permanently secured to said lock unit, and a passive plug-in element secured to the other end of the tether and adapted to enter said receiver of the lock unit and to interlock therein with said active locking element, said lock unit comprising the body of a removable shackle lock, and

said one end of the flexible tether being engaged through a receiver bore of said lock body, and a fitting on said one end



of the tether abutting a face of said body at one end of said receiver bore.

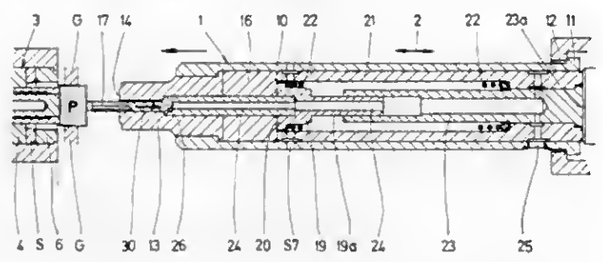
4,028,917
KEY RETAINING CYLINDER FOR A LOCK
Ernest L. Schlage, Burlingame, Calif., assignor to Schlage Lock Company, San Francisco, Calif.
Filed Apr. 12, 1976, Ser. No. 676,213
Int. Cl.² E05B *11/00*
U.S. Cl. 70—389 **13 Claims**



1. A key retaining cylinder lock device comprising a cylinder body having a bore therein extending along an axis, a plug rotatable in said bore about said axis, means in said plug forming a keyway extending in an axial direction and adapted to receive therein a key provided with an edge notch partly defined by an inner wall oriented at least partially transversely of said axis, and blocking means within said body bore and on said plug movable between a first position out of said keyway and a second position in said keyway in the withdrawal path of said inner wall during withdrawal of said key from said keyway.

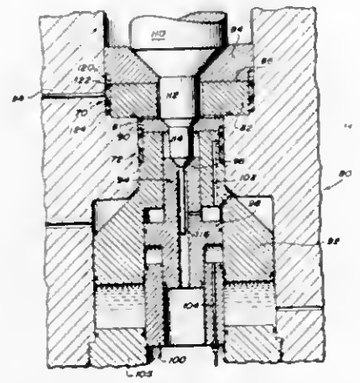
4,028,918
ASSEMBLY FOR APPLYING LUBRICANT TO THE WORKING AREA OF A PUNCHING DEVICE
Hans Kuhn, Hofstetten, Switzerland, assignor to Hatebur Umformmaschinen AG, Basel, Switzerland
Filed Jan. 14, 1976, Ser. No. 649,084
Int. Cl.² B21J *3/00*
U.S. Cl. 72—45 **14 Claims**

1. An assembly for the noncutting forming of metal components wherein lubricant is applied to the working area of a working tool, said assembly comprising:
a. a die,
b. a punch means positioned opposite and coaxial with the die and being reciprocatingly driven to move toward the die during a working stroke and away from the die during a return stroke,
c. said punch means including a working surface, a holding pin means and a punch member having a central bore,
d. said holding pin means being disposed to move within the central bore between an extended holding position and a retracted position in a direction parallel to the reciprocating movement of the punch means,
e. said central bore having a lubricant discharged portion at an outer end of the punch member and a lubricant pumping portion adjacent the lubricant discharge portion,
f. said holding pin means having a front section movably operating in the lubricant discharge bore portion and a rear section movably operating in the lubricant pumping bore portion,
g. channel means extending along the lubricant discharge bore portion,
h. means providing a supply of lubricant under pressure to said central bore, and



i. biasing means being effective to maintain no relative movement between the holding pin means and the punch member during the working stroke of the punch means until said front section engages a workpiece,
j. said punch member being movable forwardly with respect to the holding pin means with the relative movement therebetween causing lubricant to flow into the lubricant pumping bore portion ahead of said rear section of the holding pin means,
k. said biasing means being effective to move said rear section of the holding pin means forwardly with respect to the punch member during said return stroke of the punch means to cause lubricant to flow from the lubricant pumping bore portion through said channel means into said working area.

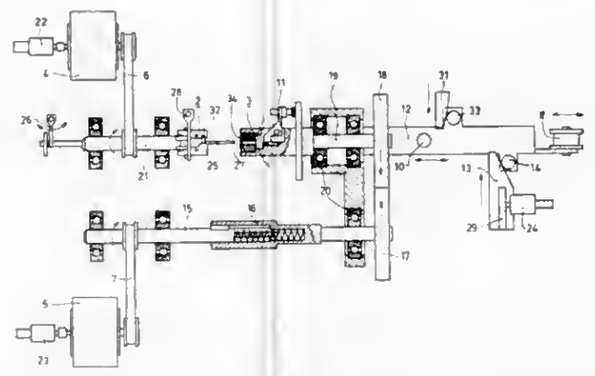
4,028,919
METHOD FOR EXTRUSION
Alfred R. Austen, 744 Georgia Ave., Reading, Pa. 19605
Continuation-in-part of Ser. No. 642,907, Dec. 22, 1975, Pat. No. 3,999,415. This application Aug. 9, 1972, Ser. No. 712,673
Int. Cl.² B21D *26/02*; **B21C** *3/06*
U.S. Cl. 72—56 **12 Claims**



1. A method for hydrostatic extrusion of a billet including the steps of:

extruding a portion of the billet through a first die ths forming a primary extrusion section of the billet;
stopping said primary extrusion followed by extruding the primary extrusion section through a secondary die, thus forming a secondary extrusion defining said desired size and shape of the finished extrusion;
stopping said secondary extrusion while simultaneously initiating extrusion of the billet to form a second primary extrustion section; and
alternately extruding said billet and said primary extrusion sections until said billet is extruded to the desired cross-section size, shape, and length.

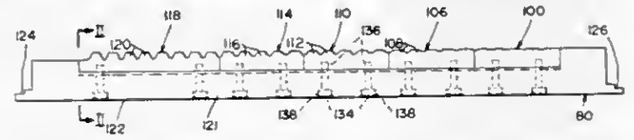
4,028,920
APPARATUS FOR HIGH SPEED WINDING OF COILS
Georg Zander, Stolberg, Germany, assignor to U.S. Philips Corporation, New York, N.Y.
Filed Dec. 8, 1975, Ser. No. 638,509
Claims priority, application Germany, Dec. 12, 1974, 2458721
Int. Cl.² B21D *11/06*; **B21F** *3/04*, *45/00*
U.S. Cl. 72—66 **6 Claims**



1. An apparatus for winding coils in which wire is guided by a winding drum having an eccentric axially extending bore movable in the direction of winding about a retractable mandril to a winding head, comprising
a winding head having an axis,
a slide mounted for relative movement with respect to said winding head in a direction parallel to said axis,
a winding drum mounted on said slide coaxially with said winding head for rotation about said axis, said drum having an eccentric axially extending bore,
means for supplying wire to be wound to and through said bore, at least a part of said supplying means being adjacent said drum
means on said winding head for clamping a wire end thereto,
a mandril mounted coaxially in said winding head,
means connected to said mandril for moving said mandril axially with respect to said winding head, and
means connected to said winding head and said drum for rotating said winding head and said drum about said axis in opposite directions, said winding head being rotated at a speed between approximately 50% and 150% of the speed of the drum.

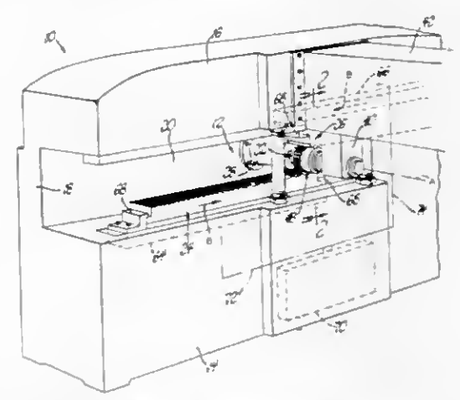
4,028,921
TOOTH FORMING RACK WITH REPLACEABLE INSERTS
Donald E. Blue, Decatur, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.
Filed Feb. 13, 1976, Ser. No. 657,773
Int. Cl.² B21H *5/02*
U.S. Cl. 72—88 **10 Claims**

1. In a tooth forming machine for selectively deforming a rotatably supported cylindrical workpiece, including a housing, a powered member slidably mounted on said housing for movement substantially transversely of such a workpiece, the improvement comprising forming die means mounted on said powered member in tangential tooth forming relation with the periphery of said workpiece including an elongated insert holder defining a top surface and holder mounting means mounting said insert holder on said powered member, a stepped series of descrete tooth forming sections and section



mounting means mounting said tooth forming sections on the top surface of said insert holder, and further including a raised flange on said top surface on one end of said tooth forming sections in contacting relation therewith for lateral retention, whereby individual tooth forming sections may be removed and thrown away when worn thereby saving on tooling costs and prolonging the useful life of the forming die means.

4,028,922
APPARATUS AND METHOD FOR SPLINING POWER TRANSMISSION MEMBERS
James Thomas Killop, Warren, Mich., assignor to Anderson-Cook, Inc., Fraser, Mich.
Filed Oct. 15, 1976, Ser. No. 732,682
Int. Cl.² B21D *9/14*, *53/28*
U.S. Cl. 72—88 **14 Claims**



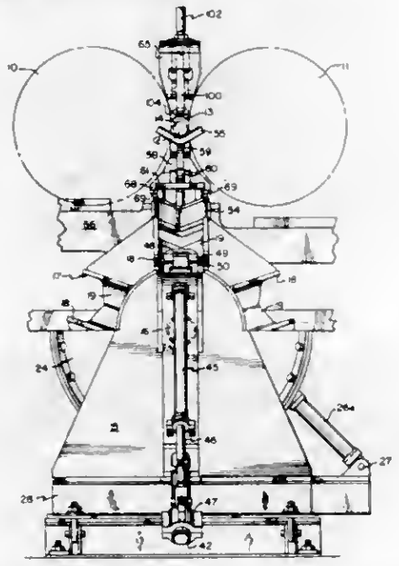
11. A method for splining an annular thin wall power transmission member, the method comprising: positioning the power transmission member on a toothed pinion type mandrel; meshing die teeth and the mandrel with the power transmission member therebetween to form a first set of splines therein; meshing die teeth with the first set of splines in the power transmission member while concomitantly meshing die teeth and the mandrel between the first set of splines with the power transmission member therebetween to form a second set of splines intermediate the first set; and meshing die teeth with the formed splines while skipping at least alternating locations between the splines to correct any out of roundness of the splined member.

4,028,923
PLUG AND SHOE CHANGING IN PIERCING AND REELING MILLS
William R. Scheib, Sewickley, and James W. Schuetz, Pittsburgh, both of Pa., assignors to Aetna-Standard Engineering Company, Ellwood City, Pa.
Filed May 4, 1976, Ser. No. 682,964
Int. Cl.² B21B *19/06*
U.S. Cl. 72—97 **23 Claims**

1. A plug changer mechanism for a piercing or reeling mill

or the like having horizontally opposed working rolls and upper and lower workpiece guide structures, which comprise

a. a plug magazine mounted on the discharge side of said working rolls and below the pass line of the mill,
b. said plug magazine having a plurality of plug pockets therein and being controllably indexable to bring said successive pockets into a predetermined working position below said pass line,
c. said plug pockets, when in said working position being disposed on a sufficiently steep incline to accommodate return by gravity of a used plug,



d. inclined guide trough means leading from said working position toward the pass line of the mill on the discharge side of said working rolls,
e. said guide trough means including a removable transfer trough section adapted for discharge with said lower guide structure to accommodate mandrel plugs of different diameter,
f. a plug pusher ram aligned with the plug pocket in said working position and controllably operable to elevate a plug along said guide trough,
g. said pusher ram having an abutment plate which, when the ram is retracted, effectively forms part of the magazine pocket at said working position.

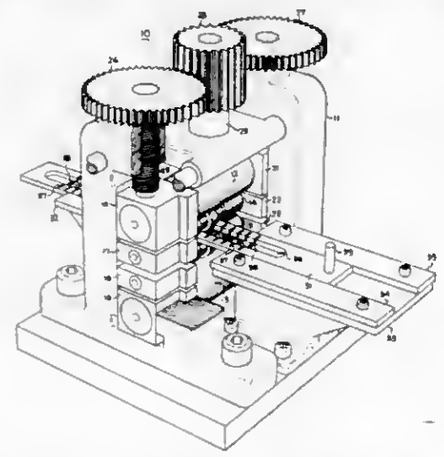
4,028,924

APPARATUS FOR CROSS-ROLLING WIRE LEADS

George J. Calevich, Cleveland; John E. McMillan, and Grant W. Ticknor, both of Kirtland, all of Ohio, assignors to General Electric Company, Schenectady, N.Y.

Filed Apr. 9, 1976, Ser. No. 675,687
Int. Cl.² B21B *39/14*
U.S. Cl. 72—252 **10 Claims**

1. A roll press for forming a lenticular cross section in a portion of a plurality of lead wires comprising:
first and second drive rolls;
first and second work rolls for forming said lenticular cross section positioned between said drive rolls, wherein the axes of said rolls are substantially parallel;
holder means adapted to carry a plurality of lead wires for conveying said lead wires between said work rolls; and
pressure means for causing said work rolls to subject said



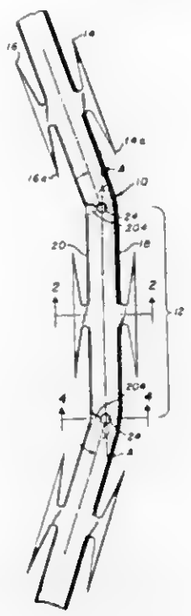
lead wires to a predetermined pressure as said lead wires are conveyed therebetween.

4,028,925

APPARATUS AND METHOD FOR FORMING BARBED TAPE

Michael R. Mainiero, Monroe, Conn., assignor to Man Barrier Corporation, Ansonia, Conn.

Filed Apr. 22, 1976, Ser. No. 679,326
Int. Cl.² B21F *25/00;* **B21D** *28/04*
U.S. Cl. 72—294 **47 Claims**



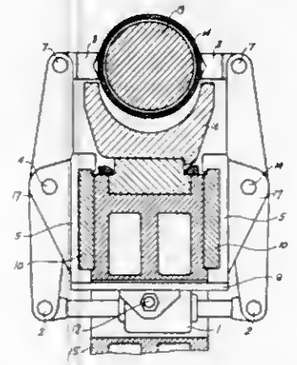
1. A method of making a coil from a strip of metal stock and comprising the steps of providing a substantially planar linear strip of metal stock, forming spaced openings along a longitudinal axis of the strip, positioning the strip by means of its openings for subsequent edge bending, and edge bending the strip in the plane of the strip adjacent its opening to form the strip into angularly displaced adjoining linear segments.

4,028,926

HANDLING DEVICE FOR SLIPPING TUBES ON THE MANDREL OF BENDING MACHINES

Jaroslav Olešovský, Ricmanice, Czechoslovakia, assignor to Prvni Brnenska Strojirna, Narodni Podnik, Brno, Czechoslovakia

Filed Dec. 4, 1974, Ser. No. 529,463
Int. Cl.² B21D *9/05, 43/00;* **B25J** *5/02;* **B65G** *65/02*
U.S. Cl. 72—422 **4 Claims**



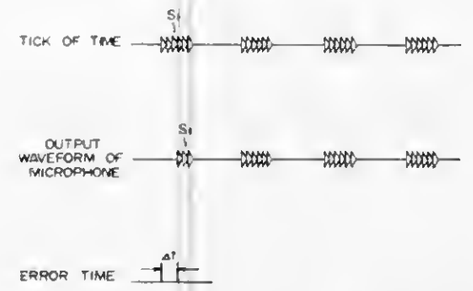
1. A device for slipping a tube to be bent on the mandrel of a bending machine, said device comprising support means, a pair of slide means slidably mounted on opposite sides of said support means for movement in a direction parallel to the axis of said mandrel, a lever pivotally mounted on each of said slide means about axes parallel to said axis, first cylinder means connected between first ends of each of said levers for moving said first ends of said levers in directions perpendicular to the axis of said mandrel independently of the movement of the slide means, a pair of gripping jaws, holder means for mounting a separate one of said gripping jaws to the other end of each of said levers, said holder means being pivotally connected to said other ends of said levers for movement about axes parallel to the axis of said mandrel independently of the pivotal motion of said levers, second cylinder means for moving said slide means in said direction, and further comprising spring means for resiliently bidirectionally biasing said holder means towards determined angular positions with respect to said other ends of said levers, thereby restricting pivotal motion of the jaws and the holder means about said other ends of said levers, said gripping jaws being removably affixed to said holder means.

4,028,927

HIGH PRECISION TIMEPIECE PACE MEASURING DEVICE

Akira Kikuyama, and Kazutoshi Ichinose, both of Ena, Japan, assignors to Ricoh Watch Co., Ltd., Tokyo, Japan

Continuation of Ser. No. 603,302, Aug. 11, 1975, abandoned. This application May 10, 1976, Ser. No. 684,535
Int. Cl.² G04D *7/12*
U.S. Cl. 73—6 **2 Claims**



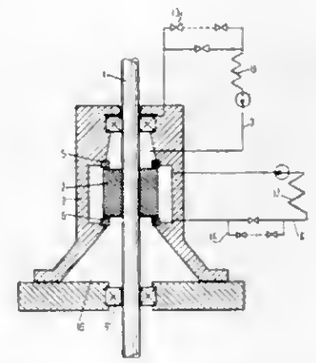
1. A high precision timepiece pace measuring device, comprising:
a first mask circuit for inhibiting a first signal of said timepiece so as to initiate a measurement of said pace of said timepiece from a second signal of said timepiece;
a second mask circuit for inhibiting timepiece signals and external noises from entering during a predetermined period from a time at the initiation of the measurement to a time immediately before termination thereof;
a counter circuit which receives said timepiece signals as its inputs;
a nine's complement presetting circuit, a carry detecting circuit, and normal and nine's complement circuits, said presetting circuit, detecting circuit and normal and nine's complement circuits each being connected to said counter circuit, said normal and nine's complement circuits being respectively selected in accordance with presence and absence of a carry in said counter circuit; and
a counter matrix circuit for feeding back output pulses of said counter circuit so as to set said mask period of said second mask circuit.

4,028,928

METHOD OF DETECTING VERY SMALL GAS LEAKAGES THROUGH A LIQUID SEAL AROUND A PASSAGE

Adrianus van Dalen, Schoorl, and Johannes W. H. van der Bergh, Bergen N. H., both of Netherlands, assignors to Neratoom B.V., The Hague, Netherlands

Filed Mar. 3, 1975, Ser. No. 554,695
Claims priority, application Netherlands, Mar. 11, 1974, 7403213
Int. Cl.² G01M *3/20*
U.S. Cl. 73—40.7 **7 Claims**



1. Method of detecting very small gas leakages through a liquid seal around an element, at which element at the same time a gas space is present, comprising applying a gas or gas mixture capable of being activated by neutrons to one side of the said liquid seal in the gas space, and thereafter determining the concentration of this gas or gas mixture in the sealing liquid as a function of time by means of neutron activation.

4,028,929

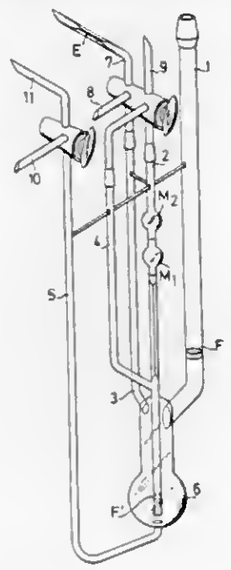
MODIFIED UBBELOHDE VISCOSIMETER

Ludwig Böhm, Mainz, Germany, assignor to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

Filed Mar. 5, 1976, Ser. No. 664,255
Claims priority, application Germany, Mar. 7, 1975, 2509916
Int. Cl.² G01N *11/06*
U.S. Cl. 73—55 **1 Claim**

1. In a viscosimeter including a reservoir, a side tube connected in communication with the reservoir and having an upper end portion for introducing liquid to be measured into the reservoir; a hollow capillary tube communicating with said reservoir including a lower end within the reservoir near its bottom and an upper end above the reservoir; said capillary tube including a measuring bulb and a separate upper bulb therein between said reservoir and said upper end thereof; and

a pressure compensating tube having a lower end communicating with said capillary tube near the top of the reservoir and an upper end communicating with the capillary tube near the upper end thereof; wherein the improvement comprises a separate pressure tube having a lower end communicating with said reservoir near its upper end and extending upwardly therefrom adjacent said capillary tube; and a double three-way cock valve connected to the upper ends of said pressure tube and said capillary tube at its connection with the upper end of said compensating tube and having three short tubes secured thereto, one aligned with the upper end of the capillary tube, one aligned with the upper end of the pressure tube and one in the plane of the pressure tube extending at an angle thereto; said double three way cock valve having two separate port arrays therein respectively associated with *i*) said capillary tube, the short tube associated therewith and the pressure compensating tube and *ii*) the pressure tube and the two other short tubes; to selectively control fluid and gas flow therethrough; and a suction tube connected at one end to the bottom of the reservoir and including, at its other end, a separate three-way cock valve having two short tubes extending therefrom.



4,028,930

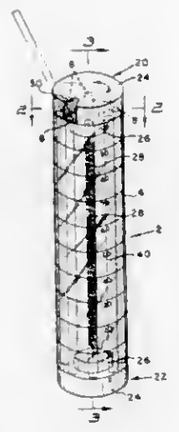
MULTIPLE HOLDER FOR DETERMINING HEMATOCRIT

Enrique Moreno, Box 1750, Mayaguez, P.R. 00708

Filed Apr. 8, 1976, Ser. No. 675,163

Int. Cl.² G01N *33/16*

U.S. Cl. 73—61.4 **1 Claim**



1. A device for receiving and holding a plurality of blood samples for centrifuging to determine hematocrit percent, comprising an elongated transparent annular body defining a central open-ended opening, a plurality of elongated holes formed in the body and arranged in an annular series within the body and extending longitudinally thereof and each having at least one open end, a head at each end of the annular body normally closing the central opening and the ends of the holes, resilient means extending through the central opening and connected at its ends to the two heads to permit rotational movement of at least one of the heads with respect to the annular body, at least one of the rotatable heads having a slot in its edge portion of sufficient radial depth to successively uncover an open end of each hole as the head is rotated with respect to the annular body, and a scale marked on the annular body and extending from end to end of the container holes for direct reading of hematocrit percent after centrifuging.

4,028,931

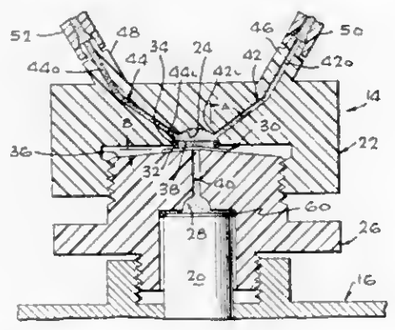
OSMOTIC PRESSURE SENSING HEAD

Jose Bisera, Camarillo; James Howard Carrington, Los Angeles, and Max Harry Weil, Beverly Hills, all of Calif., assignors to Cardio Pulminary Laboratory Research Foundation, Los Angeles, Calif.

Filed Feb. 13, 1976, Ser. No. 657,837

Int. Cl.² G01N *13/04*

U.S. Cl. 73—64.3 **3 Claims**



1. An osmotic sensing head comprising:

first walls forming a sample chamber for holding a sample fluid;

second walls forming a reference chamber for holding a reference fluid, said reference chamber including a passage with a narrow first end which opens toward said sample chamber and with a second end, said narrow first end being narrower than the area of the sample chamber;

an osmotic membrane disposed over said narrow first end of said reference chamber passage; and

pressure measuring means coupled to said second end of said reference chamber passage;

the narrow first end of said reference chamber passage forming a region in contact with said membrane which is narrower than the region of said sample chamber which is in contact with said membrane; and

the walls forming said reference chamber including a pair of conduits for carrying fluid to and from said sample chamber, at least a first of said conduits having an end angled to direct fluid entering said reference chamber against the portion of said membrane which lies directly over said narrow first end of said reference chamber passage, whereby to flush away debris lying on the portion of the membrane which lies over the narrow end of the reference chamber.

4,028,932

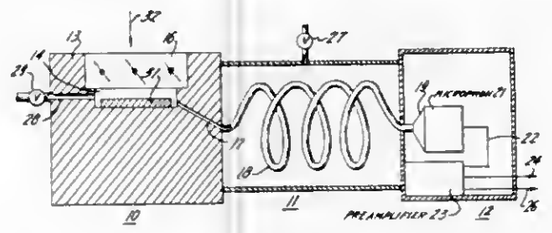
PHOTO ACOUSTIC CELL

Allan Rosencwaig, Summit, N.J., assignor to Hoffman-La Roche, Inc., Nutley, N.J.

Continuation-in-part of Ser. No. 370,526, June 17, 1973, Pat. No. 3,948,345. This application Apr. 14, 1975, Ser. No. 567,640

Int. Cl.² G01N *21/24*

U.S. Cl. 73—67.2 **25 Claims**



1. An apparatus for use in analyzing a solid or quasi-solid sample including:

first means for defining a sample chamber to hold said sample to be analyzed and for enclosing a fluid therein; said sample chamber defining means including a portion thereof for passing radiant energy having a periodically varying magnitude; said sample chamber defined having a predetermined volume;

second means responsive to pressure variations in said fluid for providing an electrical signal;

third means for fluidly connecting said sample chamber to said second means; said third means having a volume between one half and ten times said predetermined volume; and

said predetermined volume being between 1 and 50 cubic centimeters.

4,028,933

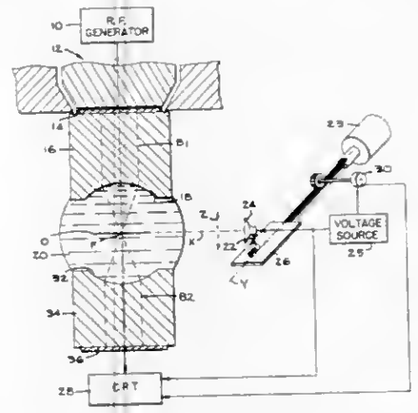
ACOUSTIC MICROSCOPE

Ross A. Lemons, Mountain View, and Calvin F. Quate, Los Altos Hills, both of Calif., assignors to The Board of Trustees of Leland Stanford Junior University, Stanford, Calif.

Continuation of Ser. No. 442,782, Feb. 15, 1974, abandoned. This application June 18, 1975, Ser. No. 587,817

Int. Cl.² G01N *29/04*

U.S. Cl. 73—67.6 **34 Claims**



1. An acoustic microscope for producing an image of an object of interest utilizing high frequency acoustic wave energy, comprising:

a. transducer means for generating acoustic energy at a frequency of at least 100MHz.

b. means forming a first solid acoustic energy propagating medium having a predetermined acoustic velocity C1 disposed adjacent said acoustic energy generating means, said transducer means and propagating medium forming a collimated beam of acoustic energy;

c. a first acoustic lens means disposed adjacent the other end of said acoustic energy propagating medium, said acoustic means forming a focal point outside of said acoustic energy propagating means, said lens having a predetermined *f* number;

d. a fluid acoustic energy propagating medium having a predetermined acoustic velocity C2, disposed adjacent said acoustic lens means and within which an object to be observed may be positioned, said fluid medium having an acoustic velocity to provide a wavelength of said acoustic energy of about 15 microns or less in said medium and substantially less than the acoustic velocity of said acoustic energy propagating medium, said velocity C1 and C2 being chosen such that their ratio produces an acoustical optical system having negligible spherical aberration;

e. means for moving, relatively, said object to be observed with respect to the beam such that the focal point of said acoustic lens occurs on the surface or within the object to be observed;

f. a second solid acoustic energy propagating medium in contact with the fluid medium and having a concavity therein forming a second acoustic lens whose focal point is coincident with said first acoustic lens; and

g. a piezoelectric transducer located on the end of said second acoustic propagating medium remote from said second acoustic lens for detecting the acoustic energy perturbed by said object so that an image of the object of interest is obtainable.

4,028,934

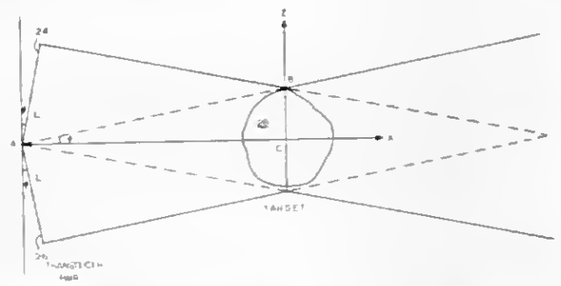
ULTRASONIC STEREOSCOPIC IMAGING DEVICE

Bruce D. Sollish, Rehovot, Israel, assignor to Yeda Research & Development Co. Ltd., Rehovot, Israel

Filed Nov. 4, 1975, Ser. No. 628,751

Int. Cl.² G01N *29/04*

U.S. Cl. 73—67.8 S **7 Claims**



1. An ultransonic imaging device for undistorted three-dimensional visualization of an object comprising:

generating means for producing high voltage electrical signals;

a scanning head containing two, cylindrically focused transducers, each of said cylindrically focused transducers being connected to said generating means, and wherein each of said transducers converts said electrical signals into mechanical energy, transmits said mechanical energy toward the object, receives reflected mechanical energy signals from material of the object, and converts the received mechanical energy into electrical pulses;

scanning means connected to said transducers for scanning the object and producing respective ultrasonic perspectives thereof from each of said transducers;

display means connected to said scanning means for displaying each of said ultrasonic perspectives; and

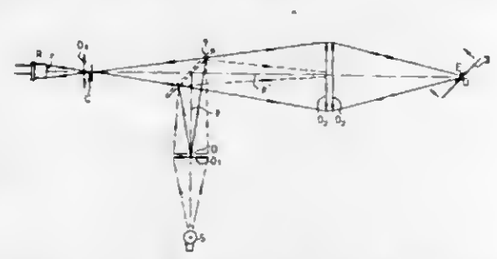
stereo viewing means attached to said display means for visualizing a three-dimensional, undistorted image formed by said ultrasonic perspectives.

4,028,935

METHOD, APPLIANCE AND INSTALLATION FOR THE OPTICAL DETERMINATION OF SMALL DISPLACEMENTS OF POINTS ON THE SURFACE OF A SOLID BODY

Michel Eric Philbert, Paris, and Jean Marcel Surget, Joinville-le-Pont, both of France, assignors to Office National d'Etudes et de Recherches Aerospatiales (O.N.E.R.A.), Chatillon, France

Filed Apr. 1, 1974, Ser. No. 456,888
Claims priority, application France, Apr. 6, 1973, 73.12519
Int. Cl.² G01B *9/00*
U.S. Cl. 73—71.3 **21 Claims**



1. A system for the determination of the displacement along a direction of a "point" on the surface of a solid body comprising:
   a small element whose outer face is constituted of a catadioptric retroreflecting material, said element being applied to the "point" whose displacement is to be measured; an appliance which includes:
   projecting means for projecting onto said element a stationary light beam non-parallel to said direction;
   occultation means in the path of reflected light off of said element concealing a portion of the reflected light which arrives to one side of a given plane while passing light which arrives to the other side of the given plane;
   photosensitive means to the rear of said occultation means for receiving the non-occulted portion of the reflected light; and
   measuring means adjacent to said photosensitive means for measuring the quantity of light occulted by said occultation means.

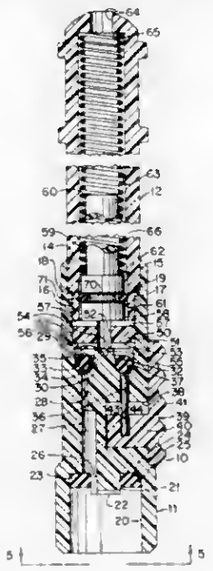
4,028,936

PRESSURE GAUGE

Billy Lynn Guy, 240 Shady Lane, Lexington, Ky. 40503

Filed Sept. 29, 1975, Ser. No. 617,697
Int. Cl.² B60C *23/02*; **G01L** *7/16*
U.S. Cl. 73—146.8 **39 Claims**

1. A pressure gauge for obtaining the fluid pressure at a source of pressure including:
   a body;
   said body having a chamber therein;
   communicating means to provide communication between said body chamber and the source of pressure to supply pressurized fluid from the source of pressure to said body chamber;
   retaining means to retain the pressurized fluid within said body chamber when communication between said body chamber and the source of pressure is stopped;
   said communicating means including:
      means in said body to open a valve controlling communication to the source of pressure;
      and fluid conveying means in said body to convey fluid from the source of pressure to said body chamber;
      said fluid conveying means including:
         a receptacle in said body to receive the pressurized fluid from the source of pressure;
         and passage means in said body connecting said receptacle and said body chamber;
   said retaining means including means to block communication between said passage means and said body chamber when fluid is not being supplied to said passage means from the source of pressure, said blocking means comprising a valve;
   release means to release the pressurized fluid from said body chamber;
   said release means including:
      a passage in said body, said passage extending from said body chamber to exterior of said body;
      closing means to close said passage, said closing means being disposed within said body chamber and comprising a valve;
      and means to activate said closing means;
   a first valve seat disposed within said body chamber and surrounding the end of said passage means of said fluid



conveying means, said valve of said retaining means engaging said first valve seat to block communication between said passage means and said body chamber when fluid is not being supplied to said passage means from the source of pressure;
   a second valve seat disposed within said body chamber and surrounding the end of said passage of said release means, said valve of said release means engaging said second valve seat to close said passage of said release means;
   resilient means within said body chamber, said resilient means comprising said valve of said retaining means and said valve of said release means;
   and means to indicate the pressure of the fluid within said body chamber.

4,028,937

NONDESTRUCTIVE TESTING OF TIRE WEAR

Richard N. Crane, Akron, Ohio, assignor to The General Tire & Rubber Company, Akron, Ohio

Continuation-in-part of Ser. No. 578,564, May 19, 1975, abandoned, which is a continuation of Ser. No. 457,041, April 1, 1974, abandoned, which is a continuation of Ser. No. 288,210, Sept. 11, 1972, abandoned. This application Aug. 24, 1976, Ser. No. 717,301
Int. Cl.² G01M *17/02*
U.S. Cl. 73—146 **10 Claims**

1. An apparatus for qualitatively determining relative tread wear of pneumatic tires comprising:
   a. a flat bearing surface plate having an opening therethrough:
   b. a pair of spaced apart depending bearing members mounted to the nonbearing surface of said bearing plate and in spaced away aligned relation to said plate opening;
   c. a pair of deflection members, one end of each deflection member being secured to a different bearing member;
   d. a movable follower member positioned within said plate opening to contact the tread of a tire resting on the plate and secured to each of said previously nonsecured ends of each deflection member; said follower being pivoted to prevent motion in the radial direction of the tire but to allow the translation of lateral motion; and

   e. a strain gauge or gauges mounted on at least one of said deflection members and capable of detecting the lateral deflection of the movable follower member.

4,028,938

ACOUSTICAL FLOW METER

Calvert F. Eck, Osterville, Mass., assignor to Ocean Research Equipment, Inc., Falmouth, Mass.

Filed Jan. 26, 1976, Ser. No. 652,291
Int. Cl.² G01F *1/66*
U.S. Cl. 73—194 A **14 Claims**

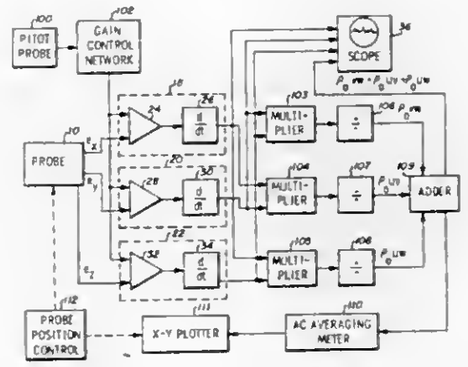
1. Apparatus for determining the flow rate of a fluid medium through a channel of the type comprising first and second transducer means for transmitting and receiving acoustical signals along a path through the fluid medium, the acoustical signals oscillating in magnitude with a series of positive-going and negative-going peaks, said first transducer means being positioned upstream relative to said second transducer means, means for measuring the difference between upstream and downstream transit times of the acoustical signals transmitted between said first and second transducer means, said measuring means being responsive to a selected one of the peaks of the acoustical signals received by said first and second transducer means, respectively, and means responsive to said measuring means for deriving an output signal indicative of the flow rate of the fluid medium through the channel, said apparatus being characterized by
   A. Means for determining whether the selected peak in the acoustical signals received by said first and second transducer means respectively, has a magnitude at least equal to a predetermined normal level, and
   B. Means for generating a flag signal indicative of the presence and absence of said predetermined normal magnitude in the selected peak.

4,028,939

SYSTEM FOR MEASURING THREE FLUCTUATING VELOCITY COMPONENTS IN A TURBULENTLY FLOWING FLUID

James C. Fletcher, Administrator of the National Aeronautics and Space Administration, with respect to an invention of Dah Yu Cheng, Palo Alto, Calif.

Filed Mar. 15, 1976, Ser. No. 667,010
Int. Cl.² G01P *5/02*
U.S. Cl. 73—189 **10 Claims**



1. A system for measuring Reynolds stress wave in a turbulent fluid comprising:
   an electromagnetic sensor with a probe movable about a mainstream direction x and about two orthogonal transverse directions y and z, said sensor having means for generating first, second, and third signals representative of the time varying drag forces on said probe about said x, y, and z directions, respectively; and
   circuit means for converting said first, second and third signals into a signal proportional to the Reynolds stress wave $\rho_0 vw + \rho_0 \mu v + \rho_0 \mu w$ wherein ρ_0 is the average density of the fluid, u is the instantaneous velocity of the fluid in the x direction, v is the instantaneous velocity of the fluid in the y direction, and w is the instantaneous velocity of the fluid in the z direction.

4,028,940

LEVEL SENSOR

William T. Sweeney; Dennis F. Keller; Gary R. Harris, and Calvin N. Armstrong, all of Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla.

Filed July 19, 1976, Ser. No. 706,987
Int. Cl.² G01F *23/14*
U.S. Cl. 73—299 **11 Claims**

1. A sensor apparatus for determining fluid levels and pressures in a fluid-containing vessel, said sensor comprising:
   a. a mounting means including a first fluid passageway positioned therethrough, said first fluid passageway having a first and a second end;
   b. a pressure sensing means in pressure sensing contact with said first end of said first fluid passageway;
   c. a pressure fluctuation dampening means positioned in fluid communication with said second end of said first fluid passageway, said dampening means comprising:
      1. a second fluid passageway having a first and a second end and positioned in fluid communication with said second end of said first fluid passageway so that said second end of said first fluid passageway joins said second fluid passageway between said first and second ends of said second fluid passageway;

2. a third passageway, having a first and a second end, positioned in fluid communication with said first end of said second fluid passageway so that said first end of said second fluid passageway joins said third fluid passageway between said first and second ends of said third fluid passageway;

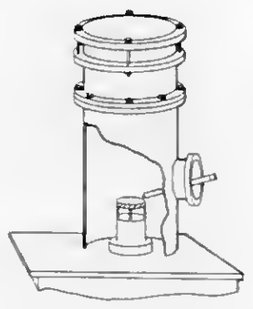
3. a fourth fluid passageway, having a first and a second end, positioned in fluid communication with said second end of said second fluid passageway so that said first end of said second fluid passageway joins said fourth fluid passageway between said first and second ends of said fourth fluid passageway; so that fluid pressure is communicated through said third and fourth fluid passageways, said second fluid passageway, and said first passageway to said pressure sensing means.

4,028,941

SENSORS FOR LOW TEMPERATURE APPLICATION

Timothy M. Henderson, and Gilbert H. Wuttke, both of Ann Arbor, Mich., assignors to KMS Fusion, Inc., Ann Arbor, Mich.

Filed Oct. 4, 1974, Ser. No. 513,333
Int. Cl.² G01K 11/02
U.S. Cl. 73—339 R 4 Claims



1. A method of determining the temperature of a body or of a specific region of a system or component of a system which comprises:

a. disposing a plurality of gas filled glass microspheres in an observation area on a part, the temperature of which is to be determined, the spheres being selected to have varying phase change characteristics by reason of differences in gas and pressure of contained gas, and

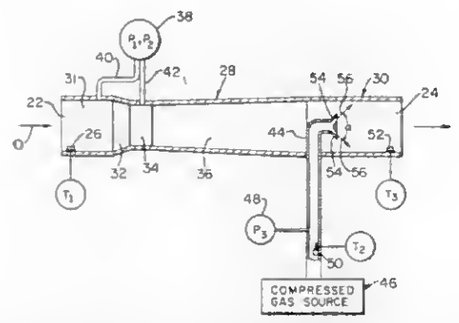
b. observing any change of phase from gas to condensate in the respective spheres to determine the ambient temperature of the part.

4,028,942

HYGROMETER

Frank J. Gardiner, 3 Ledge Road, Cumberland Foreside, Maine 04110

Filed Jan. 19, 1976, Ser. No. 650,115
Int. Cl.² G01N 25/56
U.S. Cl. 73—335 21 Claims



1. A device for measuring the absolute humidity in a sample stream of gas, said device comprising:

means for measuring the mass flow rate of said sample,

means for changing the heat energy per unit mass of said sample stream of gas by a predetermined amount;

means for measuring the temperature of said sample before the heat energy per unit mass of said sample is changed; and

means for measuring the temperature of said sample after the heat energy per unit mass of said sample is changed;

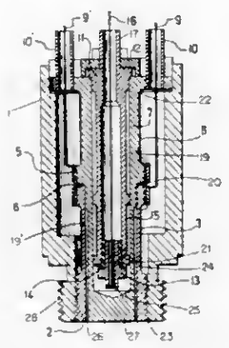
whereby said absolute humidity is determinable as a function of the measurements of (1) said mass flow rate, (2) said temperature of said sample before the heat energy per unit mass is changed, (3) said temperature of said sample after the heat energy per unit mass is changed, and (4) said predetermined amount of heat energy per unit mass of said sample stream.

4,028,943

PRESSURE AND TEMPERATURE SENSING DEVICE

Blanka Hyanova, No. 1 Sazavska, and Vladimir Plasil, No. 25 Narodni, both of Prague, Czechoslovakia

Filed July 28, 1975, Ser. No. 599,532
Claims priority, application Czechoslovakia, July 30, 1974, 5420/74
Int. Cl.² G01K 1/26
U.S. Cl. 73—345 3 Claims



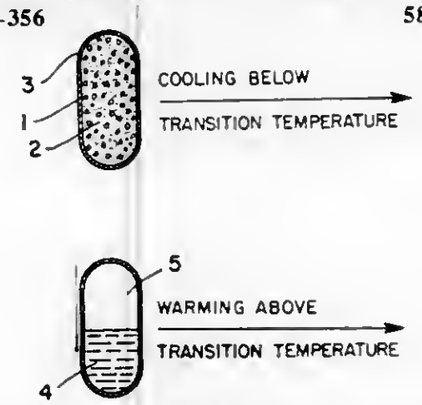
1. In a device for simultaneously sensing pressure and temperature of a test apparatus, an elongated case having a lower end, means for connecting the lower end of the case to the test apparatus, a measuring tube extending downwardly within the case, the measuring tube having a lower portion in contact with the lower end of the case and terminating flush with the lower end of the case, the measuring tube having a central portion disposed above the lower portion thereof and spaced from the case, and active strain gauge winding disposed on the central portion of the measuring tube, a protecting tube extending downwardly within the case and having a lower portion disposed within and spaced from the lower portion of the measuring tube, the lower end of the protecting tube terminating in alignment with the lower end of the measuring tube to define, between the lower portions of the measuring tube and the protecting tube, a gap providing open and unobstructed communication between the interior of the test apparatus and the central portion of the measuring tube, a compensating strain gauge winding disposed on an upper portion of the protecting tube, and sensing means disposed inside and in contact with the protecting tube for detecting the temperature of the test apparatus when the lower end of the case is connected thereto.

4,028,944

DEVICE FOR RECORDING TEMPERATURE MINIMUMS

Robert Allan Erb, Valley Forge, Pa., assignor to The Franklin Institute, Philadelphia, Pa.

Filed Oct. 31, 1975, Ser. No. 627,697
Int. Cl.² G01K 11/16, 11/18; C09K 3/00
U.S. Cl. 73—356 58 Claims



1. In a device for determining a drop below a temperature threshold point which includes a container holding a polymer-containing aqueous gel in a continuous phase,

the improvement which comprises a dispersed phase in the continuous gel, which gel liquifies from gel to liquid below a first temperature point and is reversible from liquid to gel above a temperature point,

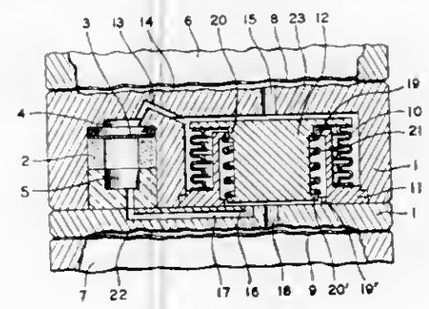
the device being thereby capable of detecting a decrease of the temperature below the first temperature point by liquifying and by a change of position of the dispersed phase relative to the gel in the continuous phase.

4,028,945

PROTECTION SYSTEM FOR THE OVERPRESSURES OF A SILICIUM WAFER SENSOR USED IN A DIFFERENTIAL PRESSURE TRANSMITTER

Giorgio Bergamini, Corso Sicilia, Italy, assignor to Nuovo Pignone, S.p.A., Italy

Filed Nov. 20, 1975, Ser. No. 633,858
Claims priority, application Italy, Nov. 21, 1974, 29682/74
Int. Cl.² G01L 7/08, 9/06
U.S. Cl. 73—395 8 Claims



1. A protection system for a silicium wafer sensor used in a differential pressure transmitter which prevents the pressure difference from reaching values which can damage the sensor, comprising:

a transmitter having a body with two opposed, spaced seats,

two wave protection membranes connected to said body and normally spaced from said seats for protecting the sensor from the fluids to be measured and for transmitting the pressure of the fluids in contact with said membranes to the sensor,

two spaced zones within said body between said seats and between which the sensor is mounted for measuring the pressure differential of the fluids,

a cavity in said body spaced from said zones and between said seats having housed therein expansion bellows polarized by a single spring within said bellows which is precharged to a prefixed value and which is always in compression when said bellows are moved in either direction, said cavity being in communication with said spaces between said membranes and said seats and with said zones, and

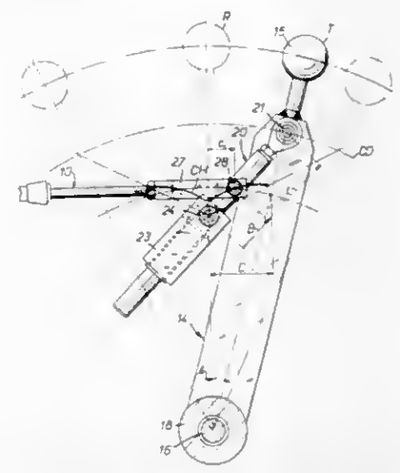
an inert liquid in said zones and cavity which transmits the fluid pressure on said membranes to said sensor and which causes said bellows always to move toward the low pressure side of the system to allow said wave separation membrane on the high pressure side of the system to move to its seat when the pressure differential exceeds the value of the pre-charge of said spring under compression, to thereby prevent the pressure differential in said zones from reaching values which can damage the sensor.

4,028,946

CONTROL LEVER ASSEMBLY

Michel Paramythioti, Chantilly, France, assignor to Albaret S.A., France

Filed Feb. 18, 1976, Ser. No. 659,030
Claims priority, application France, Feb. 20, 1975, 75.05245
Int. Cl.² G05G 1/04, 7/04
U.S. Cl. 74—522 9 Claims



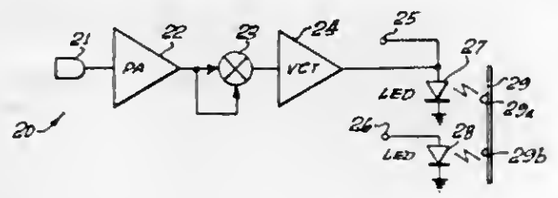
1. A control lever assembly for controlled reciprocation of an operating member, comprising a control lever pivotally mounted about a first fixed pivot, an intermediate lever, first pivot means pivotally connecting said intermediate lever to said control lever, second pivot means pivotally connecting said operating member to said intermediate lever, a sleeve member pivotally mounted about a second fixed pivot spaced from the first fixed pivot, said intermediate lever being received for relative sliding movement in said sleeve member.

4,028,947

FILM-RECORDING NOISE DOSIMETER

Steven J. Cowen, San Diego, Calif., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed May 10, 1976, Ser. No. 684,527
Int. Cl.² G01H 3/12
U.S. Cl. 73—557 **7 Claims**



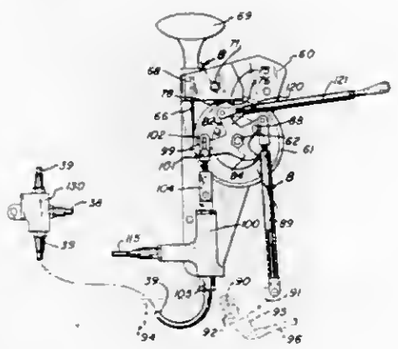
1. An apparatus for determining the exposure to noise energy over a period of time comprising:
means responsive to the noise level for generating representative voltage signals;
means coupled to the generating means for creating current signals from the representative voltage signals; first means coupled to creating means for radiating electromagnetic energy proportional to the current signals;
means disposed to receive the radiated electromagnetic energy for changing its transmissivity in a first location proportional to the quantity of the radiated electromagnetic energy impinging thereon to thereby provide an indication of the exposure to noise energy; and
second means for radiating a datum level of electromagnetic energy on a second location on the changing means to create a preestablished transmissivity thereby providing a basis from which the relative magnitude of the radiated electromagnetic energy of the first radiating means is compared.

4,028,948

ACTUATING MECHANISM FOR SEAT RESTRAINT DIVESTMENT SYSTEM

Richard H. Frost, Littleton, and Ronald L. Criley, Lake City, both of Colo., assignors to Frost Engineering Development Corporation, Englewood, Colo.

Division of Ser. No. 509,253, Sept. 25, 1974, Pat. No. 3,954,234. This application Jan. 23, 1976, Ser. No. 651,733
Int. Cl.² G05G 17/00, 9/00; B64D 17/30
U.S. Cl. 74—2 **14 Claims**



1. A single point actuating mechanism for use in sequentially actuating a multiple unit system, comprising in combination, a rotary rewind spring biased cable driven sheave having a pull cable secured thereto and terminating in a pull bandle, a stiffly releasable detent means engaging said sheave for initially restraining said sheave against unintended rotation, a rotatable multi-armed bell crank mounted for coaxial rotation with respect to said sbeave, lug means on said sheave for operative driving engagement with said bell crank after partial rotation of said sheave, link means operatively coupling said bell crank arm to selected units of the system to be actuated as said bell crank is turned by said cable driven sheave, and said detent means engaging and locking said bell crank to positively bold said bell crank in its fully rotated position upon completion of the pull on and subsequent release of the pull handle.

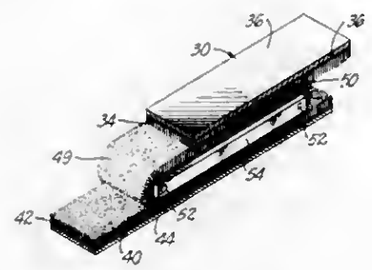
6. An actuating mechanism as defined in claim 1 further including a firing mechanism for igniting a rapid deflagrating cord comprising, in combination, a tubular housing, means at one end of said housing for receiving the ignition end of a rapid deflagrating cord, a firing pin slideably mounted in said housing for operative engagement with said ignition end, a spring for driving said firing pin into igniting relationship with said ignition end, means for releasably holding said firing pin in cocked position, and means coupling said releasably holding means to said bell crank for releasing said firing pin in response to rotation of said bell crank by said pull cable driver sheave.

4,028,949

METHOD AND MEANS FOR OPERABLY INTERCONNECTING MOVABLE PARTS

Magnus F. Hagen, 3713 Twilight Drive, Fullerton, Calif. 92632

Continuation of Ser. No. 466,782, May 3, 1974, abandoned. This application Dec. 3, 1975, Ser. No. 637,414
Int. Cl.² F16H 21/44, 7/00
U.S. Cl. 74—25 **20 Claims**



1. A synchronizing mechanism comprising:
a flat strip of friction material;
means operably supporting said strip;
a second flat strip of friction material in spaced substantially parallel, aligned relationship to the first mentioned strip;
means operably supporting said second strip of friction material;
interconnecting means operably disposed between said strips;
said interconnecting means including a longitudinally extending endless flexible planar belt of friction material;
and spaced means operably supporting said endless belt of friction material planarly for effecting random engagement and operable mesning of respective planar parts of said endless belt of friction material with both strips of friction material, and for disengagement with said strips of friction material.

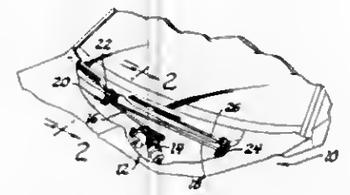
4,028,950

DEPRESSED PARKING LINKAGE FOR WINDSHIELD WIPER MECHANISMS

John R. Osterday, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich.

Filed Jan. 28, 1976, Ser. No. 652,908
Int. Cl.² F16H 21/40
U.S. Cl. 74—70 **3 Claims**

1. A windshield wiper drive mechanism comprising: a drive motor; a transmission link operatively connected to said drive motor; a wiper drive shaft; and a parking linkage disposed between said transmission link and said wiper drive shaft including an idler link rotatably supported on said wiper drive shaft, a control link pivotally connected to said idler link, a drive member secured to said control link and being drivingly connected to said transmission link, a drive link drivingly connected to said wiper drive shaft and operatively drivingly connected to said control link through said drive member, and means for selectively connecting said drive link directly to said control link and disconnecting said drive link from said control link whereby said drive shaft, idler link, control link and drive link are oscillated in unison by said transmission link and drive motor through a predetermined arc about the axis of said drive shaft when said drive link and control link are selectively connected and said drive link and said drive shaft are driven through an additional arc about the axis of said drive shaft and angularly displaced relative to said idler link by said transmission link and drive motor when said drive link and said control link are selectively disconnected.

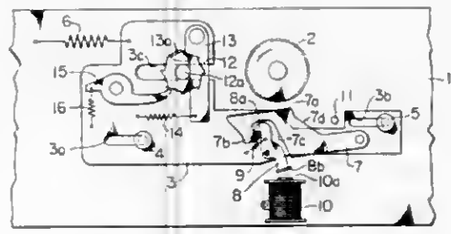


4,028,951

MOTION TRANSFORMING MECHANISM

Nobuyoshi Matsuzawa, Tokyo, Japan, assignor to Copal Company Limited, Tokyo, Japan

Filed May 8, 1975, Ser. No. 575,696
Claims priority, application Japan, May 9, 1974, 49-52483[U]; July 12, 1974, 49-82320[U]; Nov. 11, 1974, 49-136407[U]
Int. Cl.² F16H 27/02
U.S. Cl. 74—128 **6 Claims**



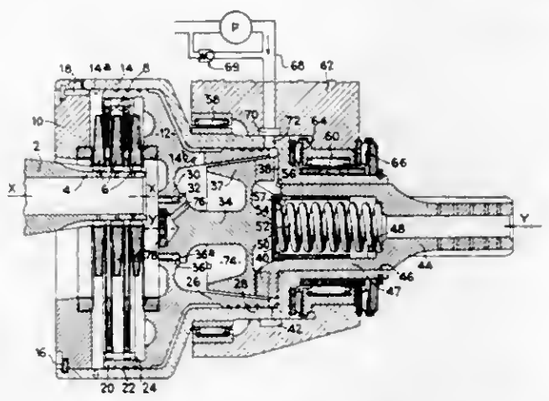
1. A motion transforming mechanism comprising a base plate, a driving gear rotatably borne by said base plate, a sliding plate slidably supported on said base plate, a spring connected between said base plate and sliding plate to bias said sliding plate to its rest position, a rack lever supported rotatably on said sliding plate and having a rack portion capable of meshing with said driving gear, a trigger lever supported rotatably on said sliding plate and engageable with said rack lever, an electromagnet secured on said base plate and capable of attracting said trigger lever, said rack lever being arranged so as to be meshed with said driving gear when said electromagnet is energized with one electric pulse and arranged so as to be disengaged from said driving gear only when said rack lever is pushed by an external force after de-energization of said electromagnet, and a member provided on said base plate and engageable with said rack lever, said rack lever being pushed by said trigger lever with only the force of rotation of said trigger lever and thereby said rack portion being meshed with said driving gear, when said trigger lever is attracted by said electromagnet, said rack portion being disengaged from the driving gear when said rack lever engages with said member, and said rack lever being held as disengaged by said trigger lever and said sliding plate being returned by said spring to its rest position when said rack lever is disengaged from said driving gear;
a ratchet wheel rotatably borne by said base plate, a ratchet lever supported rotatably on said sliding plate and engageable with said ratchet wheel, and a holding lever supported rotatably on said sliding plate and engageable with said ratchet wheel, said holding lever engages with said ratchet wheel while said sliding plate is stationary, and said holding lever is disengaged from said ratchet wheel and said ratchet wheel is rotated by one tooth by said ratchet lever when said sliding plate is moved.

4,028,952

SPEED VARIATOR EMPLOYING FRICTION HAVING AN IMPROVED FRICTION ELEMENTS-TIGHTENING DEVICE

René Leveque, Orgeval, France, assignor to Automobiles Peugeot, Paris, France

Filed Nov. 18, 1975, Ser. No. 633,095
Claims priority, application France, Nov. 18, 1974, 74.37871
Int. Cl.² F16H 15/08
U.S. Cl. 74—199 **9 Claims**



1. In a speed variator comprising a housing, a first shaft, a second shaft parallel to the first shaft, friction elements, a first series of said friction elements connected to rotate with the first shaft, a second series of said friction elements connected to rotate with the second shaft, the first series of elements being tightenable between the second series of elements, means for varying the eccentricity between the axes of rotation of the two shafts, and a device for tightening the friction elements against each other comprising a support member fixed to the housing at a first end of the friction elements, a tightening member mounted to be movable in the housing in a direction parallel to the shafts and located adjacent a second end of the friction elements opposed to said first end and movable to exert a pressure on said second end of the friction elements to urge the friction elements against the support member, pre-tightening means cooperable with the tightening member to exert a pre-tightening force on the tightening member substantially just enough to tighten the friction elements together and render them sufficiently effective when starting to transmit torque through the variator, and main tightening means cooperable with the tightening member for exerting a force on the tightening member which is proportional to the torque transmitted; the improvement comprising for constituting the pre-tightening means at least one piston and cylinder arrangement defining a chamber and interposed between the housing and the tightening member, a source of lubricating oil for the variator, lubricating oil path means putting said source in communication with surfaces of the variator which need to be lubricated, means connecting said lubricating oil path means to the chamber, a lubricating oil discharge path means connected to the chamber, the discharge path means having a sufficiently small cross section

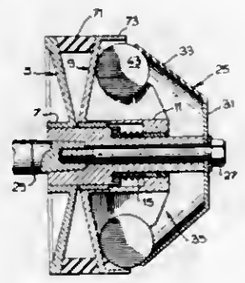
with respect to the rate of flow of the lubricating oil from the source to ensure that the lubricating oil contained in the chamber is maintained under pressure for exerting a pre-tightening force on the tightening member prior to the exertion of the tightening force by the main tightening means.

4,028,953

VARIABLE DIAMETER PULLEY

Real Lavallee, Drummondville, Canada, assignor to Gilles Soucy, Drummondville, Canada

Filed Jan. 7, 1976, Ser. No. 646,999
Int. Cl.² F16H *55/56*
U.S. Cl. 74—230.17 E **5 Claims**



1. A centrifugally-operated, variable diameter pulley, including:
a rotatable axle;
a first pulley flange fixed on said axle;
a second pulley flange rotatably mounted on said axle outwardly of said first pulley flange, and movable axially therealong toward and away from said first pulley flange;
a cover member fixed to said axle outwardly of said second pulley flange, and including an outer annular wall portion arranged to angle inwardly toward said axle and the periphery of said second pulley flange;
means on the outer face of said second pulley flange defining at least two circumferentially spaced sets of radially extending grooves arranged to face said cover member, each of said grooves including a pair of generally parallel, axially extending side walls, and a base wall inclined toward said axle and said cover member, at least the radially outer portions of said base walls being inclined toward said axle and said cover member at an angle that differs for each set of grooves;
and a circular disc received in each groove of a selected one of said sets of grooves, said circular discs being unattached to said second pulley and said cover member, and being constrained by said generally parallel side walls of their associated grooves to movements only in a radial direction;
said circular discs being moved radially outwardly in their respective grooves by centrifugal force when said axle is rotated in engagement with said inclined base walls of their respective grooves and said inclined annular wall portion of said cover member, whereby said rotatable and slidable second pulley flange is moved toward said fixed first pulley flange.

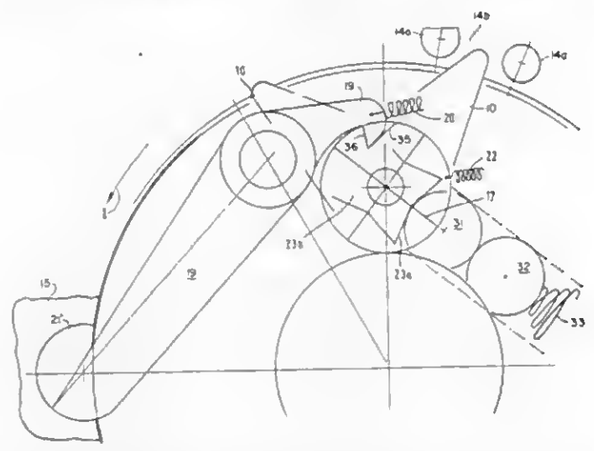
4,028,954

SLIP-FREE SHEAVE OR PULLEY

Walter Mehnert, Ottobrunn, Germany, assignor to Institut fuer Industrielien Fortschritt AG, Liechtenstein

Filed Mar. 15, 1976, Ser. No. 666,675
Claims priority, application Germany, Mar. 19, 1975, 2511889
Int. Cl.² F16H *55/36;* **G05G** *1/00;* **F16D** *13/04*
U.S. Cl. 74—230.01 **11 Claims**

1. A rope or belt pulley comprising, a housing (15), a circumferential groove in said housing, a cavity located centrally in said housing, a control ring (14) in said cavity, gear means (14*a*) in said control ring, force ring means (21) supported for limited angular movement in said cavity substantially adjacent to said control ring, pawl means (19) having a latching end and a locking end, journal means journaling said pawl means intermediate said ends, control means also journaled in said cavity for cooperation with said gear means of said control ring and with said latching end of said pawl means, inwardly facing recesses in said force ring means (21) for cooperation with said locking end of said pawl means, first spring bias means (20) biasing said pawl means (19), second spring bias



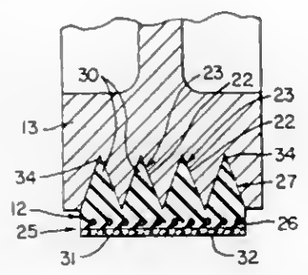
means (22) biasing said control means, said circumferential groove having walls with inwardly protruding curved ridges for controlling the position of the rope or belt means in said circumferential groove depending on the direction of rotation of said pulley housing, whereby a pull on said rope or belt means in the respective reverse direction changes an existing state of the pulley into the opposite state so that such states may be rapidly changed by repeated pulling on said rope in the respective reverse direction.

4,028,955

ENDLESS POWER TRANSMISSION BELT DRIVE SYSTEM

David G. Fisher, and Robert G. Gladden, both of Springfield, Mo., assignors to Dayco Corporation, Dayton, Ohio

Division of Ser. No. 551,477, Feb. 20, 1975, Pat. No. 3,951,006, which is a continuation of Ser. No. 390,448, Aug. 22, 1973, abandoned. This application Apr. 2, 1976, Ser. No. 673,181
Int. Cl.² F16G *5/00*
U.S. Cl. 74—234 **10 Claims**



1. A method of driving a plurality of driven sheaves disposed in a single plane with a driving sheave arranged coplanar therewith, said method comprising the steps of, providing a plurality of grooves in said driving sheave and at least one of said driven sheaves, providing a right circular cylindrical surface free of side flanges on at least another of said driven sheaves, operatively engaging an endless power transmission belt with said sheaves, providing said belt with a flat driving portion and an oppositely arranged driving portion which has a plurality of spaced projections, wrapping said flat driving portion against said right circular cylindrical surface through a substantial arc of at least 180°, and disposing said projections

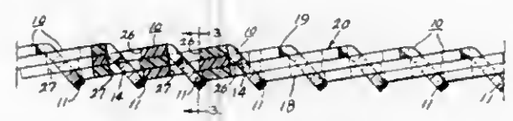
of said oppositely arranged driving portion within said grooves of said grooved sheaves with each of said projections engaging opposed sheave surfaces defining an associated groove, said step of providing a plurality of grooves in said driving sheave and said one driven sheave comprises providing a plurality of circumferential annular grooves in each sheave which are arranged in parallel relation along the axis thereof, said step of providing said belt with said spaced projections comprises providing a plurality of spaced longitudinal ribs extending along the length of the belt, said operatively engaging step comprising disposing each rib within an associated circumferential groove of each of the grooved sheaves, each of said ribs being of substantially uniform cross section at each location throughout its entire length and extending in a continuous uninterrupted manner along the full endless path of said belt, each of said sheaves being arranged so that said belt operates in said single plane, said step of providing said belt comprises providing said belt having a comparatively thin cross section which during said operatively engaging step increases belt life by reducing hysteresis, reduces belt weight which reduces centrifugal tension loss, allows easy flexing around said sheaves, and allows backside bending enabling easy engagement of said flat driving portion against said right circular cylindrical surface through said substantial arc to assure the driven sheave which has said right circular cylindrical surface is driven in a non-slipping manner.

4,028,956

TRANSMISSION BELT

Lawrence M. Thompson, Lancaster, Pa., assignor to The Arbee Corporation, Manheim, Pa.

Continuation-in-part of Ser. No. 616,768, Sept. 25, 1975, Pat. No. 4,009,620. This application Nov. 1, 1976, Ser. No. 731,459
Int. Cl.² F16G *51/80*
U.S. Cl. 74—236 **9 Claims**



1. A transmission belt comprising a series of links arranged in superimposed successive overlapping relation, each of said links having a body portion with at least two longitudinally-aligned apertures, and an integral fastening means comprising a laterally constricted neck portion and a locking tab connected to said body portion through said neck portion, said integral fastening means being longitudinally aligned with said apertures and extending through a forward aperture in the succeeding link and a trailing aperture in the next succeeding link whereby said plurality of links are secured together in overlapping relation to thereby form a belt, said body portion, neck portion and locking tab comprising a homogeneous material consisting of a segmented thermoplastic polyester containing long chain polyester units derived from dicarboxylic acid and long chain glycol and short chain ester units derived from dicarboxylic acid and low molecular weight diol and having a durometer higher than 40D (92A) and lower than 72D.

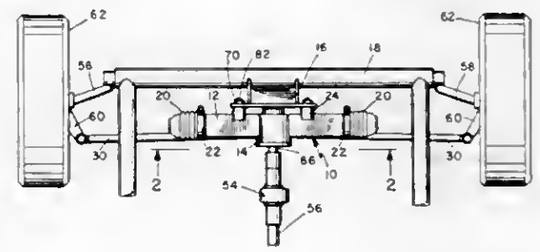
4,028,957

RACK AND PINION STEERING UNIT

Cecil Edward Wright, 8 Prospect Court, Chula Vista, Calif. 92011

Filed Oct. 31, 1975, Ser. No. 627,552
Int. Cl.² B62D *3/12*
U.S. Cl. 74—422 **4 Claims**

1. A rack and pinion steering unit for mounting on the front end of a vehicle and connected to the steering shaft of the vehicle comprising:
housing means adapted for mounting between the steered wheels of a vehicle,
a pinion gear rotatably mounted in said housing means,
a rack adapted to be driven by the steering shaft of the vehicle mounted in said housing means for engagement with said pinion gear and for reciprocal translation within said housing means,
said housing means comprising an elongated rack sub-housing receiving said rack and having a downwardly facing elongated opening,
said rack sub-housing including a bearing plate having an elongated slot mounted at the lower terminal portion of



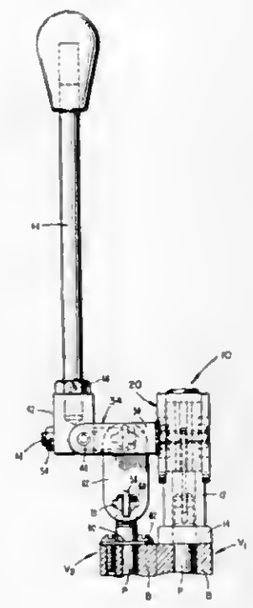
said elongated sub-housing and having a substantial bearing area in contact with said rack,
tie rod mounting means for connection to two tie rods for transmitting the translational movements of said rack into steering movements into the steered wheels of said vehicle,
said tie rod mounting means for being positioned substantially equidistant between the steered wheels of a vehicle and for mounting substantially equal length tie rods,
said tie rod mounting means comprising a flange depending substantially vertically downwardly from the central, lower surface of said rack and through said slot in said bearing plate.

4,028,958

SINGLE LEVER CONTROL FOR ACTUATING CONTROL VALVES AND THE LIKE

Kenneth W. Schuermann, and Vernon C. Slaton, III, both of Perry, Okla., assignors to The Charles Machine Works, Inc., Perry, Okla.

Filed Aug. 14, 1975, Ser. No. 604,657
Int. Cl.² G05G *9/04*
U.S. Cl. 74—471 XY **11 Claims**



1. A single lever control for actuating spaced control devices such as hydraulic valves comprising:
a housing having means to mount it on the body of one

control device and support the actuating mechanism for another adjacent control device exteriorly of said housing, a hub rotatably supported on said housing having a connector interiorly of said housing and pivotally secured to said hub offset from the rotation axis of said hub which connector is connectible to actuate the one control device upon rotation of said hub relative to said housing;

support means on said hub pivotally supporting a control lever remote from said hub on an axis perpendicular to and intersecting the rotation axis of said hub, said lever being pivotable relative to said hub and operable to rotate said hub relative to said housing by movements of said control lever;

an extension member extending generally perpendicular to the pivot axis of said control lever; and

linkage means pivotally connected to said extension member and pivotally connectible to the other control device to actuate such other control device through said linkage means and extension member upon movement of said control lever about its pivot axis.

4,028,959

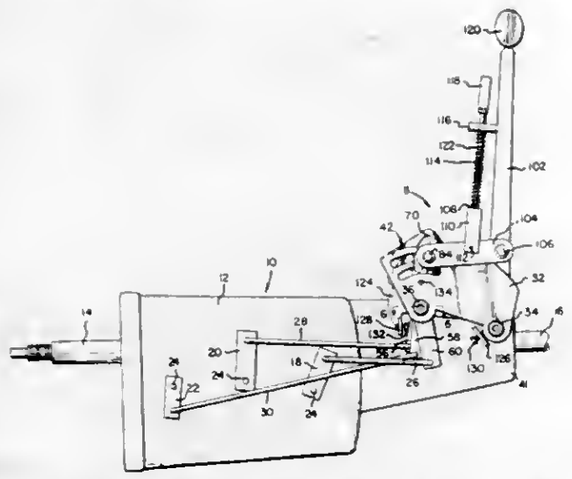
STRAIGHT ACTION GEAR CHANGING MECHANISM

Leonard Clarence Long, R.D. No. 2, Annville, Pa. 17003

Filed June 25, 1976, Ser. No. 699,800

Int. Cl.² G05G 9/08

U.S. Cl. 74—473 R **9 Claims**



1. A gear changing mechanism intended for use on an automative transmission having at least four forward speeds and a reverse speed, said mechanism comprising:

a first, second, and third speed change levers, said levers being pivotally mounted intermediate their ends on a common axis means, each of said levers having an actuator arm portion and a control arm portion, said control arm portions extending in one common direction from said axis, said actuator arm portions extending in another direction from said common axis,

said control arm portion of said first lever having a free end which is at a maximum distance from said common axis, said control arm portion of said second lever having a free end which is at an intermediate distance from said common axis, and said control arm portion of said third lever having a free end which is at a minimum distance from said common axis,

a first lever camming pin slot extending in said control arm portion of said first lever, a second lever camming pin slot extending inwardly from said free end of said second lever, a third lever camming pin slot extending inwardly from said free end of said third lever, said slots extending towards said common axis,

a first lever clearance opening in said control arm portion of said first lever, said first lever camming pin slot extending to said first lever clearance opening, said first lever clearance opening extending laterally in both directions from said camming pin slot and extending towards said common axis to substantially said minimum distance,

a second lever clearance opening in said control arm portion of said second lever, said second lever camming pin slot extending to said second lever clearance opening, said second lever clearance opening extending towards said common axis to substantially said minimum distance and extending laterally in both directions,

a camming pin extending parallel to said common axis, static camming means for guiding said camming pin along a path extending from a first location in said first lever camming pin slot to a second location in said second lever camming pin slot and to a third location in said third lever camming pin slot, said camming means also having means for guiding said pin laterally in both directions when said pin is in any one of said locations, and

manually controllable gear shift lever means for moving said camming pin whereby,

upon mounting said mechanism proximate to a transmission and connecting control means of said transmission to said actuator arm portions of said levers, the gear ratios in said transmission can be rapidly changed upon manipulation of said gear shift lever means.

4,028,960

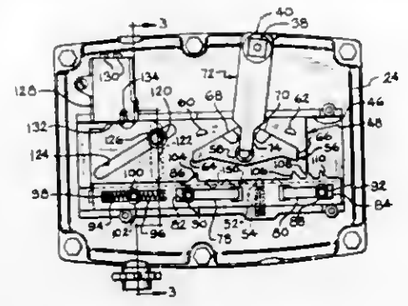
TRANSMISSION SHIFT MECHANISM

Hans Hauser, and Ronald N. Jones, both of Fredericktown, Ohio, assignors to The J. B. Foote Foundry Co., Fredericktown, Ohio

Filed June 23, 1975, Ser. No. 589,479

Int. Cl.² G05G 13/00; B60K 20/08

U.S. Cl. 74—477 **28 Claims**



1. A transmission comprising a housing, a cover on said housing, movable shift means pivotally mounted on said housing within said cover, a pawl carrier movable in a path and having a plurality of positions corresponding in number to the number of in-gear and neutral positions of the transmission, pawl means movably mounted relative to said carrier and engagable by said shift means for movement relative to said carrier, stop means for limiting continuous movement of said pawl carrier in one direction, a shift lever removably connected with said movable shift means and located outside said cover for moving said movable shift means, said pawl carrier, and said pawl means, a plurality of toothed members within said housing, and means responsive to the position of said carrier for individually connecting said toothed members with input and output shafts of said transmission.

9. A transmission comprising a housing, movable shift means, a pawl carrier movable in a path and having a plurality of positions corresponding in number to the number of in-gear and neutral positions of the transmission, pawl means movably mounted relative to said carrier and engagable by said shift means for movement relative to said carrier, a shifter fork within said housing, said fork having projecting means extending through said housing and engagable in a slot in said carrier which is located transversely to the direction of movement of said carrier, a shaft within said housing, a plurality of toothed members rotatably carried on said shaft, and means engagable by said shifter fork for individually connecting said toothed members and said shaft.

4,028,961

SHOCK ABSORBING STEERING ASSEMBLY FOR AUTOMOTIVE VEHICLES

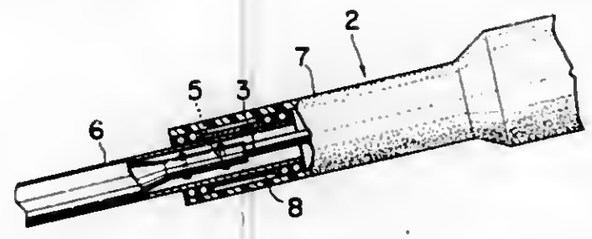
Masatuki Utsumi; Munetaka Toda, and Akitada Kuroda, all of Toyota, Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Japan

Filed Aug. 8, 1974, Ser. No. 495,907

Claims priority, application Japan, Aug. 30, 1973, 48-101065[U]

Int. Cl.² B62D 1/18

U.S. Cl. 74—492 **3 Claims**



1. A shock absorbing steering assembly for an automotive vehicle including a steering wheel and a steering mechanism, said assembly comprising, in combination, a collapsible steering shaft operably interconnected between said steering wheel and said steering mechanism, a first and a second supporting tube for said steering shaft, said first and second supporting tubes extending coaxially about said steering shaft, with the diameter of one of said tubes being larger than the diameter of the other of said tubes, said tubes being interfitted with their ends extending in overlapping relationship with said smaller diameter tube extending to within said larger diameter tube, a shock absorbing tube coaxially interposed between said first and second support tubes along their overlapping portions, said shock absorbing tube having a pair of thicker wall portions at each axial end thereof with a thinner wall portion intermediate said thicker wall portions, and bearing balls mounted in said shock absorbing tube at both said thicker wall portions, said balls having a diameter larger than the thickness of said thicker wall portions to extend beyond the surface of said shock absorbing tube into abutment with the inner surface of said larger diameter support tube and the other surface of said smaller diameter support tube whereby said support tubes may be collapsibly mounted to telescope relative to each other upon impact of a body against said steering wheel.

4,028,962

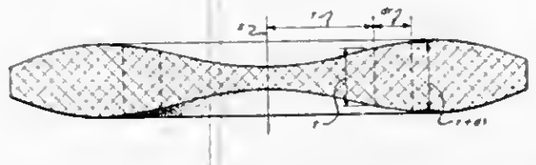
DESIGN AND CONSTRUCTION OF FLYWHEELS FROM ANISOTROPIC MATERIALS

Edwin B. Nelson, 1408 Georgia, N.E., Albuquerque, N. Mex. 87110

Filed Dec. 24, 1975, Ser. No. 644,420

Int. Cl.³ G05G 1/00, 3/00

U.S. Cl. 74—572 **4 Claims**



1. An energy storing flywheel comprised of a body of anisotropic material shaped symmetrically about a central axis of rotation, and in which:

a. the major strength axes of the anisotropic material are oriented circumferentially about the central axis of rotation.

b. the minor strength axes of the anisotropic material are oriented perpendicularly to the central axis of rotation, (i.e., radially).

c. the thickness of the body of anisotropic material is defined by the formula:

$$t = C\, r^{2m} e^{-\alpha^2 r^2}$$

wherein:

$$C = t_m\, \alpha^{2m}\, e^m m^{-m}$$

$$m = \frac{1}{2}\left(\frac{S_\theta}{S_r} - 1\right)$$

$$\alpha^2 = \frac{\rho \omega^2_o}{2S_r}$$

t = the thickness of the body of anisotropic material measured parallel to and at a distance r from the central axis of rotation.

r = the radial distance measured perpendicularly from the axis of rotation, at which distance the thickness of the flywheel is equal to t.

e = the base of "natural" logarithms with the approximate value 2.71828.

S = the maximumallowable unit tensile stress in the circumferential direction of the anisotropic material of which the flywheel is composed, with S_θ having a larger value than S_r.

S_r = the maximum allowable unit tensile stress in the radial direction of the anisotropic material of which the flywheel is composed, with S_r having a lesser value than S_θ.

ρ = the density of the anisotropic material of which the flywheel is composed.

ω_o = the angular velocity sufficient to induce the stresses S_θ and S_r throughout the body of anisotropic material.

t_m = the maximum thickness of the flywheel, which occurs at the radium $r_m = \sqrt{\frac{m}{\alpha}}$

4,028,963

ENGINE BALANCER

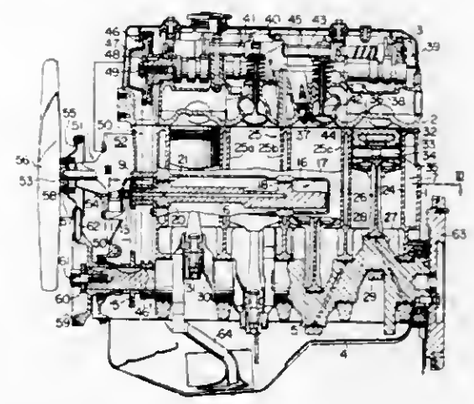
Hirokazu Nakamura; Mitsutaka Kinoshita, and Seizo Iwasa, all of Kyoto, Japan, assignors to Mitsubishi Jidosha Kogyo Kabushiki Kaisha, Japan

Filed July 9, 1975, Ser. No. 594,232

Claims priority, application Japan, July 16, 1974, 49-82043

Int. Cl.² F16F 15/10

U.S. Cl. 74—604 **11 Claims**



7. An engine, comprising;

a cylinder block having cylinders therein;

pistons reciprocatable in the cylinders;

a crankshaft drivably connected with the pistons;

a pair of balance shafts, one disposed on either side of the crankshaft and substantially parallel thereto, to balance loads imposed on the crankshaft by reciprocation of the

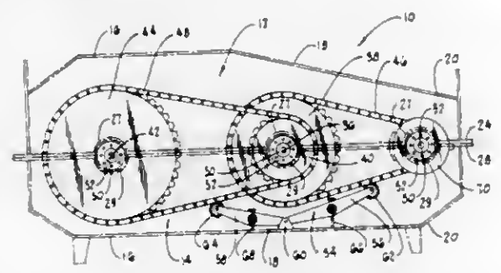
pistons, each balance shaft having two end portions, and having a journal on each end portion;
drive means connected with the crankshaft for rotating the balance shafts, in directions opposite to one another, at a speed equal to twice a speed of the crankshaft;
a bearing for each journal, in the cylinder block; and
a balance weight on each balance shaft, integral with one of the end portions and consisting of two balance weight portions, one portion being disposed on either side of the corresponding journal to minimize vibration of the cylinder block on rotation of the balance shafts.

4,028,964

SPEED REDUCER BOX FOR DRIVING A PUMP JACK

Gomer W. Jones, Rose Hill, Kans., assignor to Bird Oil Equipment Ltd., Calgary, Canada

Filed Jan. 14, 1976, Ser. No. 648,934
Int. Cl.² F16H *57/02, 7/06, 7/12*
U.S. Cl. 74—606 R **4 Claims**



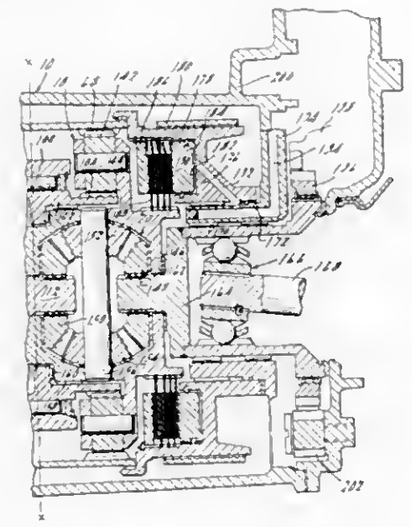
1. A speed reducer box for driving a pump jack, the box attached to a drive motor or the like and reducing the speed therefrom to the pump jack, the box comprising:
an elongated housing having a front portion, a center portion, and a rear portion, said housing further including a separate upper housing and a separate lower housing so that said upper housing can be removed for performing maintenance on the speed reducer box;
an input shaft rotatably attached to the rear portion of said lower housing and said upper housing, said input shaft rotatably attached to the drive motor;
an input shaft sprocket mounted on said input shaft;
an idle shaft rotatably attached to the center portion of said lower housing and said upper housing;
a first idle shaft sprocket and a second idle shaft sprocket mounted on said idle shaft;
an output shaft rotatably attached to the front portion of said lower housing and said upper housing, said output shaft rotatably attached to the pump jack;
an output shaft sprocket mounted on said output shaft;
a first endless sprocket chain connecting said input shaft sprocket and said first idle shaft sprocket for driving said idle shaft;
a second endless sprocket chain connecting said second idle shaft sprocket and said output shaft sprocket for driving said output shaft; and
a chain tightener having a pair of chain tightening arms attached at one end to a pivot housing, said pivot housing attached to the bottom of said lower housing, the other end of said tightening arms attached to chain tightening sprockets, said chain tightening sprockets biased against said first sprocket chain and said second sprocket chain to tighten said chains when the speed reducer box is in operation.

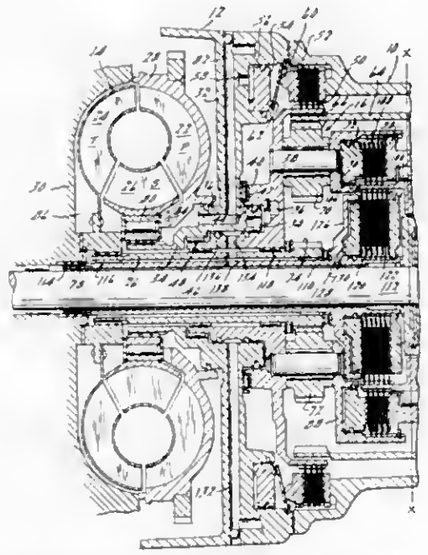
4,028,965

MULTIPLE RATIO POWER TRANSMISSION MECHANISM ADAPTED FOR IMPROVED ENGINE FUEL ECONOMY AND HIGH/LOW RATIO TRACTION

Thomas R. Stockton, Ann Arbor, Mich., assignor to Ford Motor Company, Dearborn, Mich.

Filed Dec. 9, 1974, Ser. No. 531,132
Int. Cl.² F16H *57/10*
U.S. Cl. 74—765 **6 Claims**





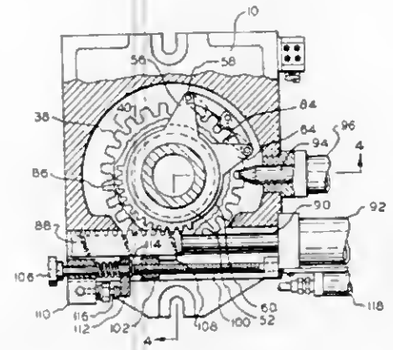
1. A transmission mechanism for an automotive vehicle comprising a hydrokinetic unit having an impeller and a turbine situated in toroidal fluid flow relationship, a pair of planetary gear units, a first of said planetary gear units having compound planet pinions rotatably mounted on a common carrier, a sun gear and a ring gear meshing with said compound planet pinions, the other gear unit being a simple planetary gear unit having a ring gear, a sun gear, a carrier and planet pinions mounted on the carrier in meshing engagement with said last mentioned ring and sun gears, first brake means for anchoring the common carrier of said first gear unit during first and second speed ratio operation, other brake means for anchoring the ring gears of said gear units during operation in the third speed ratio and reverse drive ratio, first coupling means for connecting driveably said compound carrier to the sun gear of said second gear unit during first speed ratio operation, second clutch means for locking up said second gear unit during intermediate speed ratio operation, high speed ratio clutch means for connecting directly said impeller to the sun gear of said second gear unit during third speed ratio operation thereby effecting a solid mechanical drive that bypasses said hydrokinetic unit, and reverse clutch means for connecting together said compound carrier to the sun gear of said second planetary gear unit during reverse drive operation, the carrier for said second gear unit being connected to a driven portion of said mechanism, said first coupling means being an overrunning clutch adapted to connect the compound carrier of said first gear unit and the sun gear of said second gear unit and to accommodate torque transfer from the former to the latter in one direction while accommodating freewheeling motion in the opposite direction.

4,028,966

ROTARY INDEX TABLE

Robert L. Taylor, Michigan Center, Mich., assignor to Universal Vice & Tool Co., Parma, Mich.

Filed Dec. 19, 1975, Ser. No. 642,451
Int. Cl.² B23B *29/24;* **B23Q** *17/00*
U.S. Cl. 74—822 **13 Claims**



1. A rotary index table comprising, in combination, a base, a table rotatably mounted upon said base for rotation about an axis, an index wheel operatively connected to said table for rotation therewith about said axis having a periphery, a plurality of radially oriented detent receiving recesses defined on said periphery evenly spaced thereabout, detent support means mounted for rotation about said axis, a detent, mounting mean mounting said detent upon said support means permitting radial displacement of said detent with respect to said axis for selective engagement of said detent with one of said recesses, drive means connected to said support means for reversibly oscillating said support means about said axis in indexing and return directions, said mounting means radially displacing said detent inwardly for engagement with a recess during rotation of said support means in said indexing direction and radially displacing said detent outward from engagement with said recesses during rotation of said support means in said reversing direction.

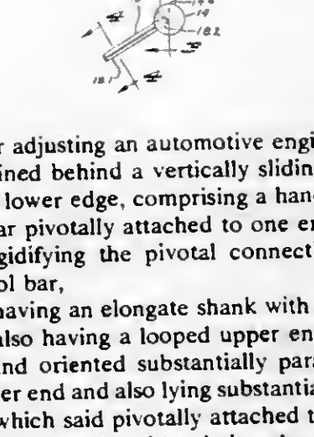
4,028,967

WATCH JEWELING TOOL

Henry B. Fried, 69-53 180 St., Fresh Meadows, N.Y. 11365

Filed Mar. 30, 1976, Ser. No. 672,003
Int. Cl.² B23P *5/00;* **G04D** *3/04*
U.S. Cl. 81—7 **7 Claims**

1. A watch-jeweling tool, comprising:
a standard having a base portion, an anvil supported upon said base portion, an upstanding neck portion fixedly secured upon said base portion the free end of which over-hangs said anvil, and a guide post fixedly secured to the free end of said over-hanging neck portion so as to be disposed above said anvil;
an elongated punch having a central portion slidably disposed within said guide post of said standard, a member fixedly secured to said central portion at one end thereof, and a threaded portion fixedly secured to said central portion at the other end thereof, said member, said central portion, and said threaded portion being disposed serially along the longitudinal axis of said punch;
a pusher disposed within said threaded end portion of said punch and adapted to cooperate with said anvil of said standard in performing a press-fitting operation;
a manually operable nut threadedly engaged upon said threaded portion of said punch and adapted to abut the lower portion of said guide post; and



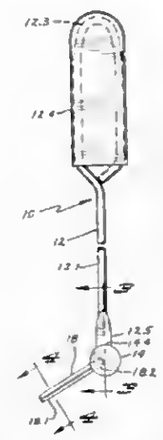
a clamp having means slidably engaging said member of said punch and additional means engaging said neck portion of said standard for preventing rotation of said punch as said nut is rotated in order to threadedly actuate said punch and move the same along the longitudinal axis thereof when said nut abuts said lower portion of said guide post and said pusher is operatively engaged with said anvil.

4,028,968

DISTRIBUTOR ADJUSTMENT TOOL

Ferdinando DeAmicis, 294 Hodder Ave., Thunder Bay, Ontario, Canada

Filed Dec. 24, 1975, Ser. No. 644,345
Int. Cl.² B25B *13/48*
U.S. Cl. 81—71 **1 Claim**



1. A tool for adjusting an automotive engine ignition point assembly confined behind a vertically sliding guillotine door with a flanged lower edge, comprising a handle, a hexagonal-headed tool bar pivotally attached to one end of the handle, and means rigidifying the pivotal connection between the handle and tool bar,
the handle having an elongate shank with a flattened lower end and also having a looped upper end to be manually gripped and oriented substantially parallel to said flattened lower end and also lying substantially parallel to the plane in which said pivotally attached tool bar swings,
the hexagonal-headed tool bar being elongate and linear in

shape and lying in a plane parallel to and at one side of the handle and of the flattened lower end thereof, the tool bar including a cylindrical hub located entirely at one side of the flattened lower end of the handle and projecting significantly transversely outwardly from said flattened lower end, the hub also including a reduced neck rotatable in and affixed to said flattened lower end of the handle, there being a peripheral space around said neck and between the hub and the flattened end of the handle, the cylindrical hub and neck having a common axis extending perpendicular to the plane of the handle and of said flattened lower end, and

said rigidifying means including a resilient friction washer surrounding said neck and located in said peripheral space, and bearing resiliently and under pressure against both the flattened lower end of the handle and against the cylindrical hub and creating a significant frictional relationship to retain the hub and tool bar in any desired position relative to the handle, the hub being continuously located at the same position relative to the handle and with a prefixed orientation relative to the loop and the flattened lower end of the handle to permit the hub to effectively lift the guillotine door, regardless of the vertical inclination of the handle while allowing the tool bar to immediately swing into the ignition point assembly for making the desired adjustment.

4,028,969

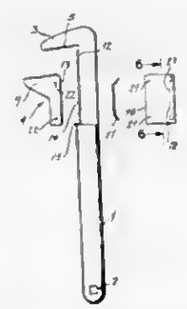
ADJUSTABLE WRENCH

Roscoe J. Politte, 2422 Shady Drive, Arnold, Mo. 63010

Continuation of Ser. No. 324,536, Jan. 17, 1973, abandoned, which is a continuation of Ser. No. 112,697, March 30, 1971, abandoned. This application Oct. 8, 1974, Ser. No. 513,099

Int. Cl.² B25B *13/24*; **F16F** *1/18*

U.S. Cl. 81—146 **1 Claim**



1. An adjustable wrench for use in gripping a workpiece comprising a handle means having at one end an acutely inclined fixed jaw angled downwardly towards the handle means and forming an angle of less than 90° therewith, said fixed jaw incorporating a workpiece gripping surface, a movable jaw incorporating a gripping surface and being normally in parallel alignment with the gripping surface of the fixed jaw and being positioned in slidable engagement with said handle means, the gripping surface of both the fixed and movable jaws being serrated to enhance the capability of said wrench for gripping a workpiece, the serrations of the fixed jaw being angled inwardly towards the handle means, the serrations on the movable jaw being angled outwardly, and together said serrated jaws providing cooperating serrations for achieving said enhanced grip, said handle means having a series of teeth formed upon its surface disposed towards the movable jaw, said movable jaw having a series of teeth formed proximate its locations of slidable engagement with the handle means teeth whereby said sets of series of teeth normally intermesh to retain the movable jaw stationary with respect to the fixed jaw and arranged for gripping a workpiece to be manipulated, said movable jaw having a jaw portion and a channel portion joined together and therein providing an opening through which the handle means is slidably disposed, a leaf spring means disposed intermediate the oppositely disposed surfaces of the handle means and the jaw opening for normally maintaining said sets of series of teeth in engagement for thereby fixing the movable jaw with respect to said handle means, the channel portion having a back forming the opposite surface of the jaw opening, said opposite surface of the jaw opening having a milled elongated slot therein and being disposed for loosely seating and retaining the ends of said leaf spring and urging said spring in a biasing relationship against the contiguous surface of the handle means, said back of the movable jaw having a tapering thickness narrowing towards its edge disposed closest to the fixed jaw of the handle means thereby normally providing greater spacing intermediate said opposite surface of the jaw opening and the handle means at this location than the spacing provided intermediate the other end of said surface of said jaw opening and the contiguous handle means, whereby pressure exerted against said movable jaw and against the bias of the leaf spring widens the entrance spacing between the normally parallel fixed and movable jaws gripping surfaces for facilitating their gripping and wedging a workpiece therebetween, and the back side of said movable jaw including a grooved surface to facilitate its adherence as the jaw is being forced towards the handle means and as said jaw is being moved with respect to the fixed jaw.

4,028,970

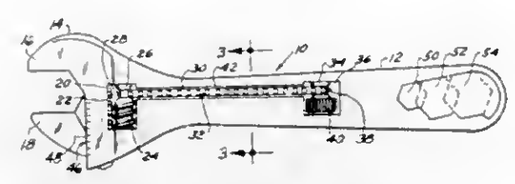
ADJUSTABLE WRENCH

Stanley J. Pelczar, 131 Green Manor Drive, East Hartford, Conn. 06118

Filed Feb. 9, 1976, Ser. No. 656,120

Int. Cl.² B25B *13/16*

U.S. Cl. 81—165 **5 Claims**



1. An adjustable jaw wrench comprising:

body means, said body means including an integral handle and a head portion, said head portion defining a stationary jaw;

a movable jaw reciprocally mounted in said body means head portion in alignment with said stationary jaw, said movable jaw including a rack;

driven means mounted in said body means head portion, said driven means being operably connected to said movable jaw and causing movement of said movable jaw relative to said stationary jaw, said driven means including:

a worm gear rotatably mounted in said body means head, said worm gear engaging said movable jaw rack; and

first sprocket means integral with said worm gear, said first sprocket means being rotatable with said worm gear and including a plurality of outwardly extending projections, said first sprocket means and at least a portion of said worm gear being positioned in an aperture in said body means head portion whereby said first first sprocket means is accessible from opposite sides of said body means;

drive means mounted in said body means handle, said drive means comprising:

second sprocket means rotatably mounted in said handle, said second sprocket means including a plurality of outwardly extending projections;

a thumb wheel coupled to said second sprocket means for causing rotation thereof, said thumb wheel and a portion of said second sprocket means being positioned in an aperture in said body means handle, said thumb wheel extending outwardly from said opposite sides of said body means handle, access to said second sprocket means being afforded from said opposite sides of said body means; and

an endless drive belt, said drive belt being perforated and extending between said first and second sprocket means, said drive belt perforations being engaged by said sprocket means projections.

4,028,971

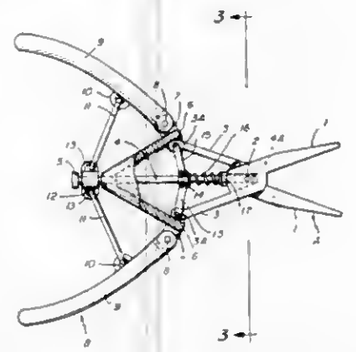
PLIERS

Charles R. Budrose, Melrose, Mass., assignor to Upaya, Inc., Saugus, Mass.

Filed June 21, 1976, Ser. No. 698,412

Int. Cl.² B25B *7/12*

U.S. Cl. 81—383.5 **17 Claims**



1. A plier comprising;

a jaw assembly including a pair of jaws and means pivotally securing the jaws with each jaw having a gripping end and an operating end,

a handle assembly including a pair of handles, concave means, means connecting the handles to the concave means, and linkage means,

and a shaft means coupled through an aperture in the concave means having one end coupled to the jaw assembly and means for operatively coupling the other end of the shaft means to the linkage means,

said linkage means also coupled to and operative by squeezing the handles to move the shaft means and in turn carry the jaw assembly into the concave means with the operating ends of the jaws being closed upon movement into the concave means thereby causing the gripping ends to close.

4,028,972

SIMPLIFIED LATHE

Glenn B. Morse, 321 Fountain St., NE., Apt. No. 1, Grand Rapids, Mich. 49503

Division of Ser. No. 397,396, Sept. 14, 1973, Pat. No. 3,903,765. This application Sept. 8, 1975, Ser. No. 611,516

Int. Cl.³ B23B *19/02*

U.S. Cl. 82—28 R **1 Claim**

1. In a machine having a frame, a spindle carried by said frame and rotatable about a first axis, and a motor mounted in fixed position relative to said frame and said spindle and having an output shaft rotatable about a second axis offset from and parallel to said first axis; the improvement comprising:

fulcrum means on said frame defining a third axis parallel to said first and second axes and spaced from the plane containing said first and second axes;

an idler arm having one end mounted in said fulcrum means, said idler arm being pivotally moveable about said third axis;

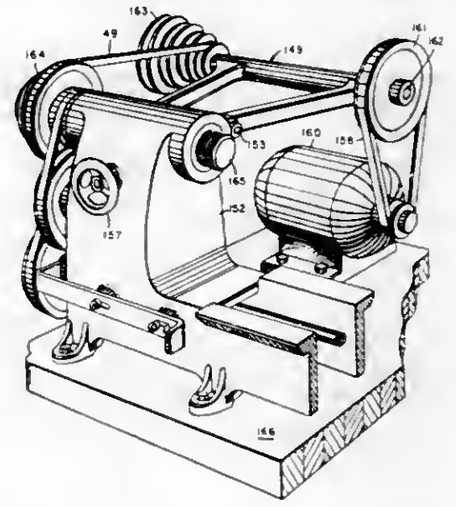
an idler shaft journalled at the opposite end of said idler arm, the axis of said idler shaft being parallel to and substantially coplaner with said first and third axes, the length of said idler arm being such that the plane containing said idler shaft axis and said second axis is substantially perpendicular to the plane containing said first and third axes;

a first sheave on said spindle;

a second sheave on said motor output shaft;

third and fourth sheaves on said idler shaft and aligned, respectively, with said first and second sheaves;

a first drive belt entrained on said first and third sheaves;



the axis of said fulcrum means lying within the confines of said first drive belt;

a second drive belt entrained on said second and fourth sheaves; and

adjustment means mounted on said frame and contacting said idler arm to induce rotation of said idler arm about said third axis to adjust the tension of said second belt.

4,028,973

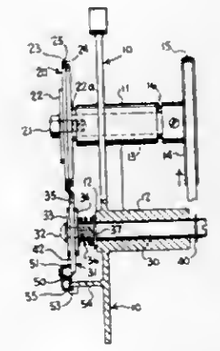
CUTTING DEVICE

John J. Bogdanski, Stamford, and Harold Silverman, Norwalk, both of Conn., assignors to Pitney-Bowes, Inc., Stamford, Conn.

Filed Aug. 25, 1975, Ser. No. 607,449

Int. Cl.² B26D *7/08*

U.S. Cl. 83—169 **1 Claim**



1. In an envelope opening device having

a frame;

a first shaft rotatably mounted on said frame;

a first cutting disc secured to said shaft and having a peripheral cutting edge formed thereon;

means for driving said shaft and said cutting disc;

a second shaft rotatably mounted on said frame;

a second cutting disc secured to said second shaft and having a peripheral cutting edge formed thereon which cooperates with the said peripheral cutting edge of the first disc so that a sheet of material moving between said discs may be cut;

a block member, said member having a surface comprising a solid polytetrafluoroethalene lubricant material; and

support means carried by said frame and carrying said block member for yieldably biasing said block member into engagement with said second disc, said surface of said block member thus being yieldably urged into engagement with that radial face of said second disc which contacts the corresponding face of said first cutting disc whereby lubrication of, and dampening of vibrations in, both of said discs may be simultaneously achieved.

APPARATUS FOR CUTTING BITUMEN CAKES

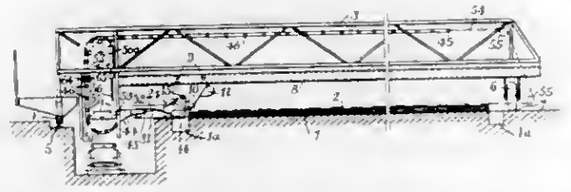
Jean-Jacques Collet, 760 Chemin de Cleres, 76230 Bois Guillaume, France

Filed Dec. 30, 1974, Ser. No. 537,338

Claims priority, application France, Jan. 16, 1974, 74.01446; Nov. 29, 1974, 74.38032

Int. Cl.² B26D *7/10*

U.S. Cl. 83—171 **10 Claims**



1. Apparatus for cutting cakes of bitumen or other similar products out of a sheet of said product during the cooling thereof in a basin in which it was previously cast, comprising a transverse, substantially horizontal girder spanning said basin, wheels for supporting and guiding either end of said girder on longitudinal races disposed on either side of said basin, means for feeding said girder step by step on said wheels, a carriage suspended from said girder, means for driving said carriage with a continuous motion in a forward direction corresponding to the cutting of a transverse strip of product out of said sheet and for driving said carriage step by step in a return direction corresponding to the removal of said cut strip, a heated cutter suspended from said carriage, means for lowering said cutter to an operative position and enabling same to cut a transverse strip out of said sheet or product when said carriage travels in said forward direction, means for raising and holding said cutter in an inoperative position when said carriage travels in said return direction, a pusher arm carried by said carriage and having one end adapted to slip on the strip of product during the cutting thereof when said carriage travels in said forward direction and to push the end of the freshly cut strip in front of said pusher arm when said carriage travels in said return direction, a wedge member adapted to roll transversely on said basin bottom, means for drivingly coupling said wedge member to said carriage so as to cause said wedge member to raise said strip of product as it is cut out of said sheet, a transverse belt run adapted to support and carry along transversely said transverse strip of product when said strip has been cut completely out of said sheet, means connected to said carriage for unrolling said belt run under said strip, behind said wedge member, as said carriage moves in a forward direction and as said strip is cut out of said sheet while avoiding any relative movement between said strip and said belt run, and a longitudinal cutter adapted to cut a cake of product out of said strip each time said strip is stopped during its step by step travel in said return direction.

4,028,975

BLADE GUARD LIFT FOR POWER SAW

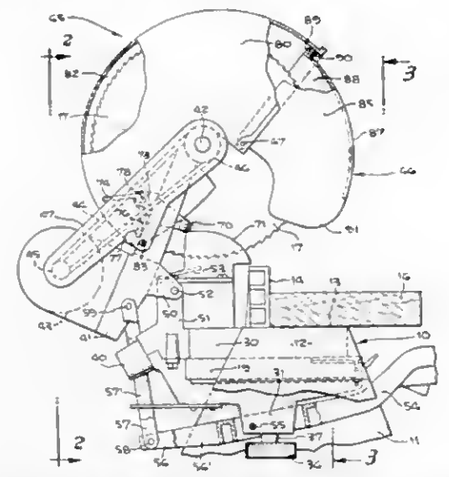
James C. Bennett, Carlsbad, Calif., assignor to Ralph S. Rosen, Los Angeles, Calif.

Continuation-in-part of Ser. No. 654,933, Feb. 3, 1976. This application July 22, 1976, Ser. No. 707,488

Int. Cl.² B27B *5/18;* **B23D** *45/14*

U.S. Cl. 83—397 **10 Claims**

1. A guard device for a power operated bench saw wherein a frame is provided with a work surface for supporting a work piece and a motor actuated saw blade is carried by a movable structure on the frame by means of a manually actuatable leverage having attachments respectively to the frame and the movable structure for moving the saw blade between an elevated non-operating position above the work surface and a progressively lowered cutting arc for advancing the blade past the work surface,



said movable structure including a guard device comprising

a main plate means having a tiltable mounting on said movable structure,

a cam follower on said guard device spaced from the tiltable mounting and a cam track in fixed position on said table receptive of said cam follower, said cam having a contour productive of a progressive relative movement of said plate means resulting in a clearance between said guard device and the work piece as the blade is advanced through said cutting arc.

4,028,976

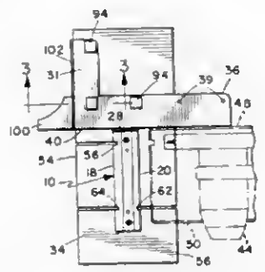
CUTTING TOOL GUIDANCE SYSTEM

Peter Kundikoff, Rte. 4, Box 870, Escondido, Calif. 92025

Filed June 5, 1975, Ser. No. 584,134

Int. Cl.² B27B *9/04*

U.S. Cl. 83—745 **15 Claims**



1. A straight edge for use in guiding a power tool for cutting a straight line on work stock, having a top surface, a side edge and a work stock corner formed by the intersection between the top surface and the side edge, such straight edge comprising:

a planar cross member adapted to overlie said work stock parallel to the direction of cutting said work stock,

said cross member comprising a guiding edge for said power tool,

a planar back plate member connected to said straight edge to be coplanar with said cross member and extending orthogonal to the direction of cutting said work stock in overlying relation with regard to said work stock, said cross back plate having an outer terminal edge and an inner terminal edge spaced apart from said outer terminal edge and located in the plane containing said plate and cross members,

flange means formed on said outer terminal edge and projecting beyond both sides of the plane containing said back plate and cross members to abut the work stock side edge to position said back plate member on the work stock top surface with said inner edge located above and in contact with the top surface so that said back plate is supported on top of the work stock top surface whereby the straight edge is supported in guiding orientation on the work stock by the work stock top surface, said flange means being tapered toward said guiding edge to avoid obstruction with an overhang of the power tool.

4,028,977

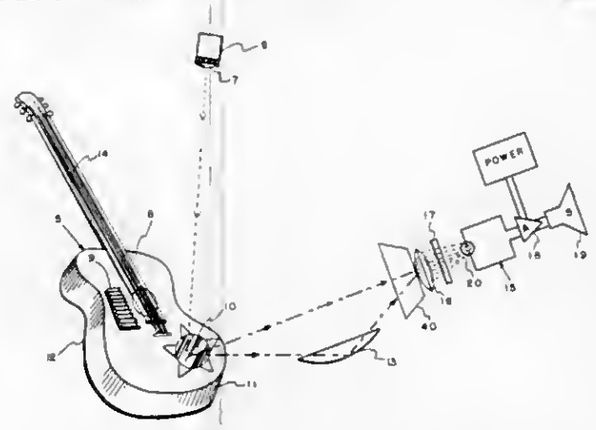
OPTOELECTRONIC SOUND AMPLIFIER SYSTEM FOR MUSICAL INSTRUMENTS

John Joseph Ryeczek, R.D. No. 1, Box 190C, Point Marion, Pa. 15474

Filed Nov. 17, 1975, Ser. No. 632,306

Int. Cl.² G10H *3/00*

U.S. Cl. 84—1.16 **12 Claims**



1. In combination, a musical instrument and a sound amplifier system, comprising:

A. an acoustical guitar having a front face adjacent the strings thereof and a back face defining a sound box therebetween and light reflecting means coupled to one of said faces thereof adapted to vibrate responsive to the musical vibrations of the acoustical guitar said light reflecting means further adapted to modulate and reflect light rays transmitted from a source remote from the musical instrument; and;

B. receiving means at a point remote from the acoustical guitar including a photo-electric device to receive the modulated light rays from the reflecting means to produce electronic signals corresponding to musical tones associated with the modulated light rays and also including means to amplify said electronic signals in an audible range.

4,028,978

SYNTHESIZER TYPE ELECTRONIC MUSICAL INSTRUMENT WITH VOLUME ENVELOPE DECAY TIME CONTROL

Elsaku Okamoto, Hamakita, Japan, assignor to Nippon Gakki Seizo Kabushiki Kaisha, Japan

Filed Dec. 19, 1975, Ser. No. 642,615

Claims priority, application Japan, Dec. 26, 1974, 50-156898[U]; Dec. 26, 1974, 50-156899[U]

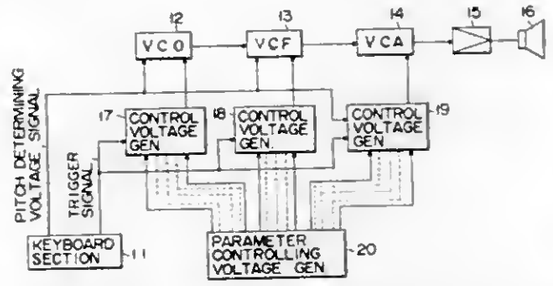
Int. Cl.² G10H *1/02*

U.S. Cl. 84—1.26 **5 Claims**

1. An electronic musical instrument comprising:

a keyboard section including a keyboard having keys and means responsive to actuation of a key on the keyboard to produce a pitch determining voltage signal whose voltage value is a function of the note of the key being actuated and a trigger signal indicating a depression and a release of a key;

tone signal generating means coupled to receive the pitch determining voltage signal from said keyboard section for producing a tone signal having a frequency corresponding to the key being actuated, said tone signal generating means continuing to produce the tone signal of said frequency after release of the key;



envelope providing means coupled to receive the tone signal from said tone signal generating means and the pitch determining voltage signal and the trigger signal from said keyboard section for providing the tone signal with an envelope which decays with a decay time after said trigger signal indicates the release of the key, said decay time being a function of the pitch determining voltage signal.

4,028,979

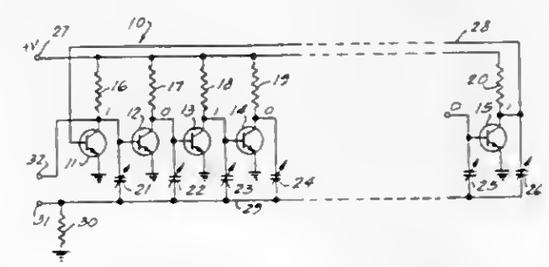
MULTIPLEXER FOR ELECTRONIC MUSICAL INSTRUMENT

David A. Luce, Clarence Center, N.Y., assignor to Norlin Music, Inc., Lincolnwood, Ill.

Filed June 19, 1975, Ser. No. 588,359

Int. Cl.² G10H *1/02;* **G10F** *1/00;* **G10C** *3/12*

U.S. Cl. 84—1.24 **13 Claims**



1. A multiplexer for an electronic musical instrument having a keyboard, comprising a plurality of stages connected in series so that all of such stages operate successively, each of said stages having a time constant determining circuit for establishing a period of delay between operation of such stage and operation of a following stage, said time constant determining circuit having circuit means controlled by operation of an associated key of said keyboard so that operation of a key varies said period of delay, and decoding means connected with all of said stages and responsive to a variation in said delay of any stage for producing output signals which uniquely identify operated ones of said keys.

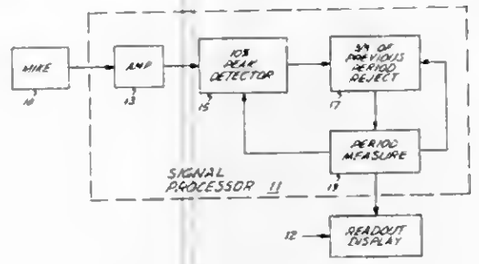
U.S. Cl. 84—422 R **1 Claim**

1. A foot operated apparatus for playing a cymbal, drum or similar instrument which comprises a striking stick flexibly, pivotedly mounted on a rigid arm member attached to a foot pedal assembly that moves said arm member up and down, said rigid arm member comprising a first straight rod to which said stick is mounted parallel to said rod, second rods perpendicularly attached to said first rod and springs attached to one end of said stick said apparatus and to said second rods.

4,028,985
PITCH DETERMINATION AND DISPLAY SYSTEM
Lauren V. Merritt, 95 Monte Vista Lane, Sierra Madre, Calif. 91024
Filed Feb. 17, 1976, Ser. No. 658,366
Int. Cl.² G10G *7/02*
U.S. Cl. 84—454 **10 Claims**



1. An improved pitch determining and display system comprising, in combination:

a. signal generating means for providing a signal which corresponds to pitch produced by a musician said signal generating means comprising a microphone for picking up the sounds produced by a musician and translating the sounds into corresponding electronic signals;

b. signal processing means for determining the pitch produced said means being connected to the signal generating means and driven by the electronic signals generated by said microphone, said signal processing means comprising:

i. amplifier means connected to the microphone for amplifying the signal produced by the microphone:

ii. peak detector means connected to the amplifier means for providing an output pulse when an input peak pulse from the amplifier means exceeds a previous input pulse less an amount proportional to the time that has elapsed since the previous input pulse;

iii. inhibit means connected to the peak detector means for inhibiting the transmission of pulses which arrive during a period immediately following each accepted pulse, while transmitting onward acceptable pulses, the period being approximately ⅝ of the time between acceptable pulses; and

iv. period measuring means connected to the inhibit means and the peak detector means for providing a signal proportional to the time between peak detector means-input pulses, the single being fed back to the inhibit means; and

c. display means connected to the signal processing means for translating the determined pitch into convenient musical notation, said display means being adapted to receive the signal from said period measuring means.

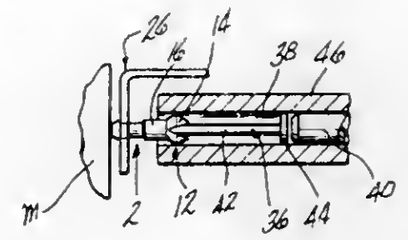
CONNECTOR MEMBER FOR TIP OF FASTENER
Richard John Beton, South Blackburn, Australia, assignor to Olin Corporation, New Haven, Conn.
Filed Mar. 24, 1976, Ser. No. 670,032
Int. Cl.² E04G *3/00*; **F16B** *15/00*
U.S. Cl. 85—10 E **2 Claims**

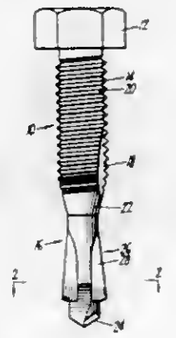


1. A disintegrating connector member for use in providing a temporary connection between an elongated fastener shank and a bracket having at least one aperture therethrough, said member comprising: an axially elongated body formed from an elastically deformable material, said body having a forward nose portion sized to engage the bracket aperture for retention of the bracket on the connector member, a bore extending axially of the body sized to snugly receive and retain the fastener shank therein, and a rearward part of said body being formed with a plurality of radially outwardly and rearwardly extending wings which are radially deflectable to provide means for snugly engaging a plurality of different diameter bores, said wings being joined to said body along a circumferential hinge line to facilitate said radial deflection, each of said wings being separated from the adjacent wings by intervening substantially V-shaped slots.

4,028,987
SELF-DRILLING SCREWS
Robert Neil Wilson, Surrey Hills, Australia, assignor to Illinois Tool Works Inc., Chicago, Ill.
Continuation of Ser. No. 485,475, July 3, 1974, abandoned.
This application Dec. 5, 1975, Ser. No. 638,220
Int. Cl.² F16B *25/00*
U.S. Cl. 85—46 **5 Claims**

1. A self-drilling thread forming screw having first and second shank portions, a head at one extremity adjacent the first portion and a drill tip at the other extremity adjacent the second portion, the first portion being of greater cross-sectional size than the second portion, the first portion including thead convolutions formed thereon and including means to form complementary threads in the material within which the screw is to be engaged, the drill tip including a pilot drill portion having laterally extending cutting edges with a maximum transverse dimension not greater than the maximum transverse dimension of the second shank portion and flute regions extending generally longitudinally of the second shank

portion from the laterally extending cutting edges, the second shank portion being generally cruciform in cross-sectional configuration, such a configuration being formed by wing portions terminating in secondary cutting edges extending transverse the axis of the fastener intermediate the pilot tip cutting edges and the first shank portion and further including arm portions extending in a plane generally perpendicular to the plane including the wing portions and in substantial axial alignment with the plane including the lateral cutting edges of the pilot drill, the extremities of the arms adjacent the drill portion terminating above the secondary cutting edges and merging with the uppermost extremity of the flute regions of

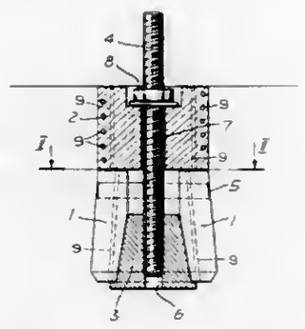


the pilot drill so that the material removed by the drilling action of the pilot point may flow unimpeded into the region above the secondary cutting edges, the transverse dimension of the arm portions being less than the transverse dimension of the secondary cutting edges, the secondary cutting edges having a transverse dimension greater than that of the pilot cutting edges and substantially equal to the root diameter of the thread convolutions, a tapered shank portion interconnecting the first shank portion and second shank portion, the wing portions tapering outwardly from a position beneath the tapered shank portion toward the secondary cutting edges and thereby providing a clearance angle above said secondary cutting edges.

4,028,988
DOWEL

Heinrich B. Schäfers, Wachmannstrasse 22, Bremen, Germany (2800)

Filed Jan. 13, 1976, Ser. No. 648,754
Claims priority, application Germany, Jan. 18, 1975, 2501925
Int. Cl.² F16B 13/00
U.S. Cl. 85—87 5 Claims

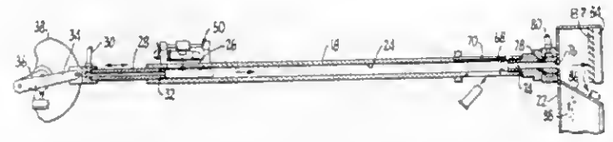


1. In a dowel comprising a threaded bolt having an inner and outer end, a head element surrounding said bolt and having two ends which face to said inner and outer ends of said bolt, respectively, a spreading element which surrounds said bolt and is connected to said bolt adjacent said inner end, said spreading element having a tapered end which faces said outer end of said bolt, at least one pressure element arranged around said bolt between said head element and said spreading element and a nut mounted on said bolt near said end of said head element facing said outer end of said bolt for shifting said pressure element on said spreading element, the improvement comprising said head element being made of artificial stone.

4,028,989
BULLET EXTRACTOR

Alphonse C. Vassallo, 1439 Wayland, San Francisco, Calif. 94134

Filed July 24, 1975, Ser. No. 598,555
Int. Cl.² C06B 21/00
U.S. Cl. 86—1 A 4 Claims

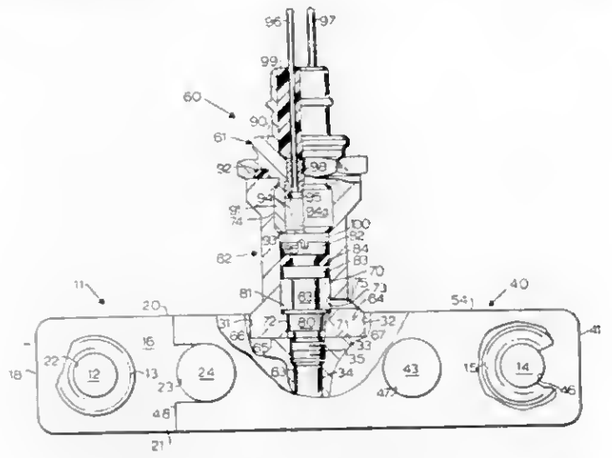


1. A device for disassembling cartridges wherein said cartridge consists of a casing containing a propellant with a bullet therein, said casing having an extraction rim larger than the body of the casing, said device having a barrel, said barrel having a breech adjacent the entrance end, said barrel having a diameter sufficient to pass an entire cartridge case, means for propelling said catridge through said barrel and a reduced portion at the terminal end of said barrel, said reduced portion being of sufficient diameter to pass the cartridge body but to not pass the extraction rim of the cartridge, whereby the extraction rim is engaged and stopped and the projectile and the powder is extracted from said case by inertia.

4,028,990
EXPLOSIVELY ACTUATED RELEASE DEVICE FOR CALL BUOYS AND THE LIKE

Gene Terry Waide, Gilroy, Calif., assignor to Holex Incorporated, Hollister, Calif.

Filed July 15, 1976, Ser. No. 705,557
Int. Cl.² F42B 3/00
U.S. Cl. 89—1 B 10 Claims



5. An explosively actuated release device, including in combination:

a first connection member having means for attachment to a primary body,

a second connection member having means for attachment to a secondary body which is eventually to be removed from proximity to the primary body,

means providing a separating force urging said primary and secondary bodies apart, at least in the vicinity of the primary body,

said first and second connection members being aligned and longitudinally overlapped through part of their lengths, in side-by-side relationship, and located in between the primary and secondary bodies,

means associated with the first and second connection members for preventing relative lateral movement of the two members, and for preventing relative rotational movement of the two members,

a retaining block positioned at corresponding adjacent outer edges of the two connection members, and means associated with the retaining block and with said adjacent outer edges for interengaging the block with both edges to prevent relative longitudinal movement of the two connection members,

means normally holding the retaining block in the interengaged position,

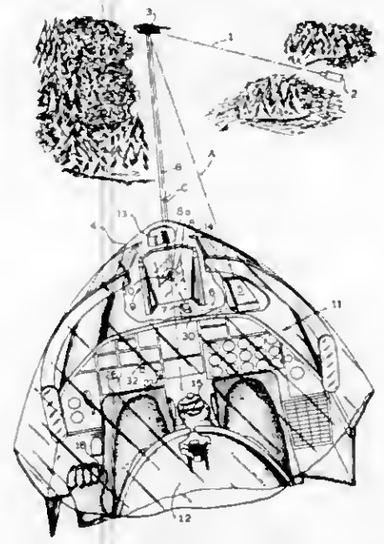
explosively actuated means for driving the retaining block outwardly away from the connection member edges when separation of the primary and secondary bodies is desired, to thereby separate the interengaging means by moving the retaining block to a disengaged position, and

means connecting the retaining block, when disengaged, to one of the connection members.

4,028,991
WEAPON SYSTEM

Milton Kuby, Huntington Station, N.Y., assignor to Fairchild Industries Inc., Germantown, Md.

Filed Oct. 10, 1975, Ser. No. 621,499
Int. Cl.² F41G 3/02
U.S. Cl. 89—41 ME 4 Claims

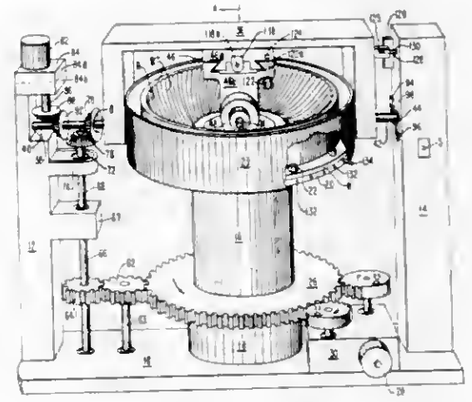


1. A weapon system adapted to fire projectiles in rapid succession comprising in combination, a weapon, means operatively connected and operable to fire the weapon, sight means operatively associated with the weapon to facilitate alignment of the weapon with a target and provide an indication thereof, said sight means including a transparent member, beam generating means operatively connected to the weapon system, and adapted to illuminate a target with the beam, receiving means operatively connected to the weapon system and receptive to a reflection of the beam from the illuminated target, said receiving means adapted to provide an indication of the relative position of the target with respect to the receiving means, comparator means adapted to receive said indications from said sight means and said receiving means and operate said weapon firing means, said sight means and said receiving means including means to compare said indications and locate and display target reticles on said transparent member in response thereto, the location of said target reticles displayed on said transparent member being responsive to the signals provided by said comparing means.

4,028,992
METHOD AND MEANS FOR MAKING HELICAL RACES

Manfred R. Kuehnle, 6 Linmoor Terrace, Lexington, Mass. 02173

Filed Nov. 20, 1975, Ser. No. 633,642
Int. Cl.² B23C 3/18, 3/34
U.S. Cl. 90—11 C 6 Claims



1. The method of forming helical grooves in a work-piece defining a toroidal enclosure having an axis of symmetry and a circular axis perpendicular to the axis of symmetry and defining a diametric plane through the enclosure comprising the steps of

A. rotating the work-piece about a first axis corresponding to the axis of symmetry of the toroidal enclosure and perpendicular to the diametric plane of the enclosure.

B. positioning a cutting tool adjacent to the work-piece so that its cutting end engages the enclosure wall,

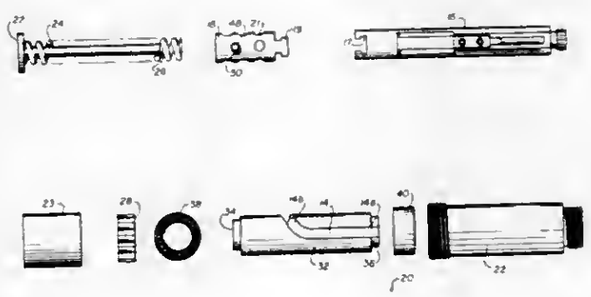
C. rotating the cutting tool about a second axis perpendicular to the first axis and coincident with the circular axis of the enclosure from an initial position adjacent one point on the wall to a final position adjacent another point on the wall, and

D. rotating the work-piece and tool in synchronism about their axes of rotation so as to maintain the cutting tool at a constant attack angle against the enclosure wall from said initial position to said final position so that the tool cuts a groove in the enclosure wall having a uniform cross section along its length.

4,028,993
CYCLE FIRING RATE REDUCING ASSEMBLY FOR AUTOMATIC WEAPONS

George L. Reynolds, Cambridge, Ill., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Feb. 23, 1976, Ser. No. 660,191
Int. Cl.² F41D 11/12
U.S. Cl. 89—130 6 Claims



1. In an automatic weapon system having a gun tube with recoil and counterrecoil cycles and a linearly movable bolt carrier, the improvement comprising:

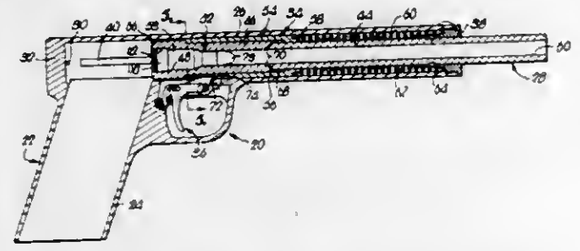
a rotatable drum having a curved cam surface,
cam follower means carried by the bolt carrier for tracking in said cam surface of the drum to sequentially rotate the drum in opposite directions and dissipate thereby energy generated by the bolt carrier during recoil and counterrecoil movements of the bolt carrier, and,
means for storing recoil energy of the bolt carrier to initiate counterrecoil movement of the bolt carriage,
said cam surface including a straight portion adjacent the muzzle end of the weapon system gun tube and a helically curved portion adjacent to the breech end of the system.

4,028,994

MICRO-PRECISION TIMED FIRING HANDGUN

Benjamin A. Feriuga, 3814 Leavenworth Road, Kansas City, Kans. 66104

Filed Oct. 29, 1975, Ser. No. 626,980
Int. Cl.² F41C *5/02*
U.S. Cl. 89—161 **14 Claims**



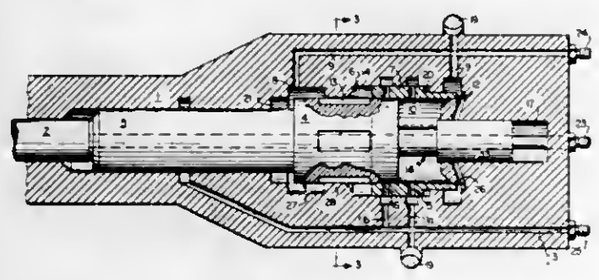
12. In a gas operated handgun of the drop barrel type:
a frame comprised of a fixed, elongate tube in which a barrel is reciprocably carried,
said tube being closed at its normally rearwardmost end to present a breech plate having a fixed firing pin positioned to project into said tube axially thereof,
said barrel having a cartridge chamber at its normally rearwardmost end;
a trigger operated actuator mechanism coupled with said barrel for propelling the same with a cartridge in the chamber from a position spaced forwardly of said firing pin rearwardly into engagement with said firing pin; and
means incorporated with said mechanism for utilizing gases from said cartridge upon discharge thereof for holding said barrel seated against said breech plate until the gas pressure from said cartridge is dissipated,
said mechanism further including barrel return means for returning said barrel to said first position upon the dissipation of said gases.

4,028,995

HYDRAULIC STRIKING APPARATUS

Pekka Salmi, and Pentti Raunio, both of Tampere, Finland, assignors to Oy Tampella AB, Finland

Filed Apr. 18, 1975, Ser. No. 569,531
Claims priority, application Finland, Apr. 25, 1974, 1267/74; Feb. 17, 1975, 750425
Int. Cl.² F01B *7/18*; **F01L** *25/04, 17/00*
U.S. Cl. 91—276 **7 Claims**



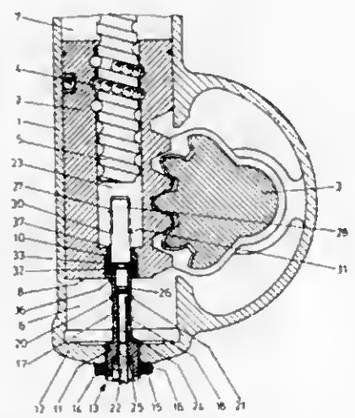
1. An hydraulically operated striking means, comprising:
body means having an axial, generally cylindrical, interior space, said body means having a radially inwardly protruding annular member;
cylindrical piston means axially slidable between a first position and a second position within said cylindrical space, said piston means having an annular flange, the outer cylindrical surface of the flange of said piston means being in sliding contact with the inner surface of said protruding annular member, said piston means having means defining canal means in the outer cylindrical surface of said piston means flange;
said body means, said annular member and said piston means flange defining a first annular space and a second annular valve space axially separated by said protruding annular member, said protruding annular member being adjacent said piston means; and
annular distributing valve means slidably disposed in said second annular valve space and being axially slidable between a first position and a second position, said valve means and said annular member surrounding a portion of said piston means so that in all operating positions of said piston means said flange is in contact with the inner surfaces of said distributing valve means and said annular member,
said first annular space communicating with said second annular valve space by means of said canal means when said piston means is in said first slidable position, said annular member and said flange preventing communicating between said spaces when said piston means is in said second slidable position.

4,028,996

ADJUSTABLE BYPASS VALVE TO EFFECT STEERING LIMITS IN BOOSTER POWER STEERING SYSTEM

Erich Jablonsky, Boblingen, Rems, Germany, assignor to Zahnradfabrik Friedrichshafen AG, Germany

Filed Jan. 12, 1976, Ser. No. 648,526
Claims priority, application Germany, Jan. 30, 1975, 2503676
Int. Cl.² F15B *15/22*
U.S. Cl. 91—401 **5 Claims**



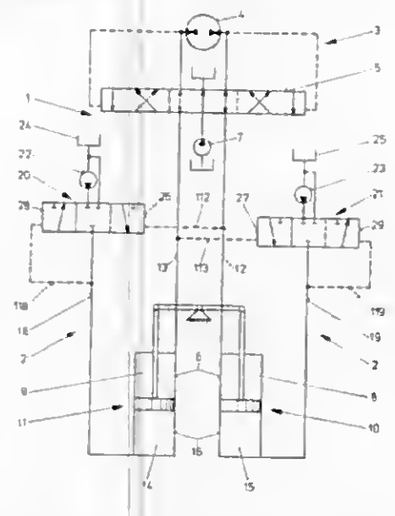
1. In a booster steering device having
a double acting cylinder with opposed pressure chambers divided by a reciprocal piston comprising a wall with faces exposed to pressure in respective chambers whereby said piston may be directionally actuated by pressurizing of one chamber and exhausting the other chamber for steering a vehicle, the improvement comprising:
bypass valve means secured to said cylinder and passing slidably and sealingly through said piston wall to block flow between said pressure chambers when said piston is intermediate limits of piston travel;
said bypass valve means having flow passages disposed on opposite sides of said piston wall when said piston is intermediate limits of piston travel and said flow passages being then exposed to pressure only in respective pressure chambers; and flow passages being of a length to span between said pressure chambers through said piston wall to effect flow between said pressure chambers at respective limiting positions of said piston to bypass pressure from a pressurized chamber to a chamber being exhausted to drop booster pressure in a pressurized chamber thus determining limiting positions of said piston;
said bypass valve means comprising an elongated body;
a hushing through the wall of piston and carried thereby and said elongated body passing through said bushing;
means permitting axial play of said bushing in said wall within limiting positions;
said flow passages being of a length to span said bushing between chambers to effect bypass flow;
said bushing and flow passages having respective cut-off edges coacting by relative movement for cut-off of bypass flow between chambers upon pressure actuation of said bushing within said axial play limiting positions whereby when either chamber is pressurized at a limiting position of said piston actuating booster pressure for reverse travel of side piston is effected.

4,028,997

MOTOR VEHICLE STEERING

Armin Lang, Schwaebisch Gmuend, Germany, assignor to Zahnradfabrik Friedrichshafen AG, Friedrichshafen, Germany

Filed May 2, 1975, Ser. No. 573,883
Int. Cl.² B62D *5/08*; **F15B** *11/16, 13/06*
U.S. Cl. 91—412 **11 Claims**



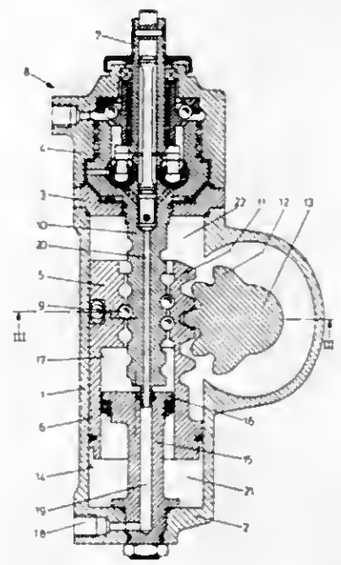
1. In combination with a steering system including a source of pressurized fluid, a control valve (5) connected to said source, servo motor means (6) having pressure control chambers (8 and 9) and fluid pressure lines (12 and 13) connecting said pressure control chambers to the control valve for power assist purposes, means for reducing vibrations produced in the system because of inertia forces, comprising a servo motor assembly (16) having regulated pressure chambers (14 and 15) respectively opposing said pressure control chambers of the servo motor means, a source of pressure medium (22 and 23) connected to said servo motor assembly, and a pair of pilot valve assemblies (20 and 21) responsive to pressure differentials between the pressure control chambers and the regulated pressure chambers for regulating the pressures of the pressure medium in the regulated pressure chambers associated with the servo motor assembly, each of said pilot valve assemblies including a valve piston (35 or 36) having opposed pressure faces (26–28) or 27–29) and a valve body (30) within which the valve piston is movable, conduit means (18 or 19) for establishing fluid communication between one of the pressure faces (28 or 29) and the regulated pressure chamber (14 or 15) opposing one of the pressure control chambers associated with the servo motor means, passage means (12–112 or 12–113) for establishing continuous fluid communication between only the other of the pressure faces (26 or 27) and the other of the pressure control chambers associated with the servo motor means, and ports (32 and 34) establishing fluid communication between the source of pressure medium and the regulated pressure chambers.

4,028,998

AUXILIARY POWER STEERING GEAR FOR MOTOR VEHICLES HAVING A COMMON HYDRAULIC SYSTEM

Erich Jabionsky, Boblingen, Germany, assignor to Zahnradfabrik Friedrichshafen AG, Germany

Filed Dec. 2, 1975, Ser. No. 637,072
Int. Cl.² F01B *9/00*; **F15B** *9/10*
U.S. Cl. 92—107 **3 Claims**



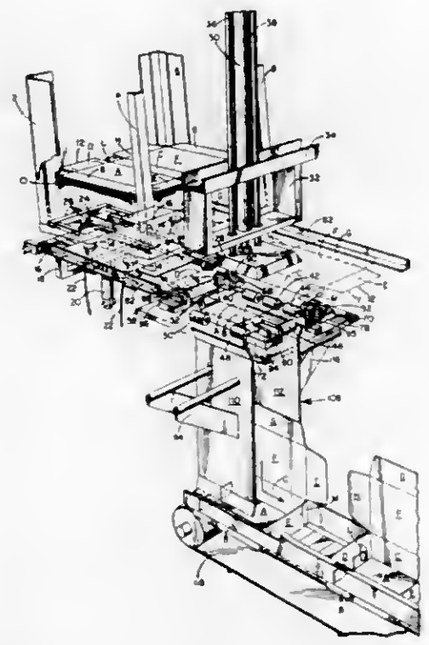
1. In an auxiliary power steering servomotor:
a housing (1) having a double acting pressure cylinder comprising pressure chambers (21, 22) and a movable piston (6) in said cylinder having opposite end surfaces in respective pressure chambers and being reciprocally movable by pressurization of respective chambers;
steering mechanism drive means comprising a gear rack (11) on said movable piston and a gear sector (12) supported in said housing to drive a steering mechanism responsive to movement of said movable piston;
a bore (17) in said movable piston, and said housing carrying a fixed piston (15) extending slidably into and terminating within said movable piston bore and seal means on said fixed piston for effecting a continuous seal with said bore between said pressure chambers;
said fixed piston having opposed faces of areas predetermined relative to respective opposite end surfaces of said movable piston to reduce the effective pressurized areas thereof for reduction of the effective drive force of said movable piston to a predetermined degree required to operate the steering mechanism;
said fixed piston being constructed and arranged so that the respective effective area of each end surface of said movable piston is determined by the difference between respective diameters of said movable and fixed pistons for predetermining the pressure force exerted by said movable piston on said steering mechanism to maintain said predetermined reduced driving force exerted by said movable piston on said steering mechanism when either chamber is pressurized;
said bore in said movable piston having an axis offset from the axis of said movable piston in a direction away from said gear rack to effect increased end surface areas for said fixed piston.

4,028,999

CARTON FORMING MACHINE

Richard G. Lee, Boston, Mass., assignor to Econocorp, Inc., Needham Heights, Mass.

Filed Nov. 4, 1975, Ser. No. 628,738
Int. Cl.² B31B 3/60, 1/50
U.S. Cl. 93—51 R 8 Claims



1. Apparatus for forming a carton blank comprised of a bottom, front and back panels with end tabs, end panels with slits therein adapted to receive said end tabs, and a lid with front and end flaps, into carton form with the lid in open vertical position and with the lid end flaps extending in the plane of the lid,

said apparatus comprising a plurality of spring pressed rollers arranged to define a rectangular opening slightly smaller than the said bottom,

means for feeding flat blanks horizontally from a supply source to a supported position over said opening,

said feeding means arranged to direct said blanks sideways so that in reaching the position over said opening, only one end panel and the said bottom pass over said opening,

first means for initially opening said slits in said end panels while said flat blank is being moved sideways to position over said opening,

a mandrel arranged to descend to engage the said bottom to force said blank downward past said rollers whereby said front, end and back panels will engage said rollers and will be bent to vertical position,

other means for maintaining said slits in open position as the said end panels are being bent toward said vertical position,

means adjacent but spaced laterally from said other slit opening means to cause the said end tabs to be bent toward and to enter said open slits from the outer sides of said end panels as the bending of said front, end and back panels toward vertical is proceeding,

and vertical passages between the other slit opening means and the said tab bending means that are adjacent the ends of said back panel through which the end flaps extending from the lid may pass when the back and lid together have been bent to vertical position and said now erected carton is being moved downwardly by said mandrel past said rollers.

4,029,000

INJECTION PUMP FOR INJECTING MOLTEN METAL

Hiromi Nakamura; Yosizo Komiyama, both of Numazu; Mitsuo Yamashita, and Masaji Ishii, both of Tokyo, all of Japan, assignors to Toshiba Kikai Kabushiki Kaisha and Denki Kagaku Kogyo Kabushiki Kaisha, both of Tokyo, Japan

Continuation-in-part of Ser. No. 427,856, Dec. 26, 1973, abandoned. This application June 12, 1975, Ser. No. 586,283
Claims priority, application Japan, Dec. 28, 1972, 48-2150; Dec. 17, 1973, 48-141609; Dec. 17, 1973, 48-141610; Dec. 17, 1973, 48-141611; Dec. 17, 1973, 48-141612; Dec. 17, 1973, 48-141613
Int. Cl.² F01B 11/02; C04B 35/56, 35/58
U.S. Cl. 92—170 9 Claims

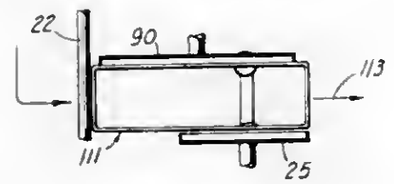
1. In an injection pump including a cylinder and a piston slidably received in said cylinder for injecting molten metal, the improvement wherein at least one of said cylinder and said piston are made of a composite sintered body consisting essentially of a mixture of 10–90% by weight of boron carbide and at least one compound selected from the group consisting of 5–90% by weight of titanium diboride, 5–90% by weight of zirconium diboride and 0.5–30% by weight of boron nitride.

4,029,001

CASE ERECTOR

Donald G. Reichert, Tarpon Springs, Fla., assignor to A-B-C Packaging Machine Corporation, Tarpon Springs, Fla.

Division of Ser. No. 496,028, Aug. 9, 1974, Pat. No. 3,952,636. This application Jan. 21, 1976, Ser. No. 651,073
Int. Cl.² B31B 1/80
U.S. Cl. 93—53 M 2 Claims



1. A method of opening a flattened case blank having one side and one end disposed along a first plane and an opposite side and an opposite end disposed along a second plane closely paralleling said first plane and with each end being of substantially equal width, said method comprising the steps of:

a. urging said case blank between first and second suction cup means by first flight chain and bar means;

b. gripping the one side with said first suction cup means and the opposite side with said second suction cup means;

c. pivoting said second suction cup means about a vertical axis in a first direction in an arc greater than 90° but less than 180° of a circle of radius approximating said end width;

d. moving said second suction cup about said axis in a second direction which is opposite to said first direction until each of said ends assumes a substantially right angle orientation with respect to each of said blank sides;

e. releasing the case blank sides from the first and second cup means; and

f. urging the case from between said first and second suction cup means by second flight chain and bar means.

4,029,002

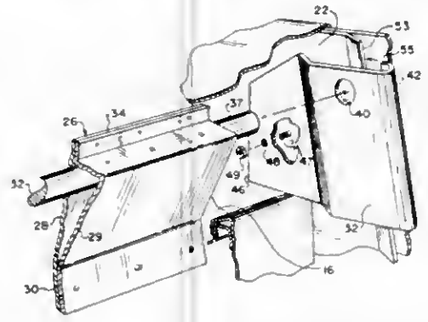
KITCHEN VENTILATOR DAMPER CONSTRUCTION

Edward B. Vandas, St. Louis, Mo., assignor to McGraw-Edison Company, Elgin, Ill.

Filed Dec. 8, 1975, Ser. No. 638,502
Int. Cl.² F23J 11/00
U.S. Cl. 98—115 K 2 Claims

1. In a kitchen venting system having an exhaust duct and a power fan means therein, the combination of interconnected opposing pairs of side walls defining an air inlet open to the kitchen that communicates through internal passage means

with the exhaust duct, a damper, means to pivot the damper to one of the pairs of side walls to move between a closed position across the inlet and an open position removed from the inlet, said damper having end edges spaced apart less than the distance between the one pair of side walls and said pivot means including stub shafts projecting beyond the end edges of the damper, said pivot means further including bearing means to receive and journal the respective stub shafts, each said bearing means being in the form of a flat relatively thin plate having when shaped a first portion with an opening therein for receiving and journalling one of the stub shafts and



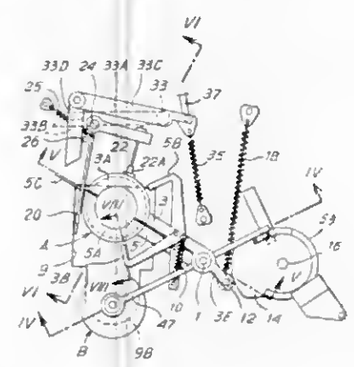
having a laterally offset end portion, said offset end portions of the plates abutting the one pair of the side walls and maintaining the first portions of the plates at the shaft opening spaced from the one pair of the side walls, means for releasably securing each bearing means plate to the adjacent side walls to allow the ready installation and removal of the damper relative to the side wall, each wall of the one pair of side walls terminating along a free edge generally proximate the inlet, each plate on the end thereof opposite the offset portion being folded over almost on itself to define a lip, and said lip overlying and covering the free edge of the side wall when the bearing means plate is secured to the side wall.

4,029,003

DEVICE FOR THE EXTEMPORARY PREPARATION OF BEVERAGES

Adriana Manaresi, Via delle Porte Nuove 12, Florence, Italy

Filed Feb. 24, 1976, Ser. No. 661,048
Int. Cl.² A47J 31/00
U.S. Cl. 99—295 4 Claims



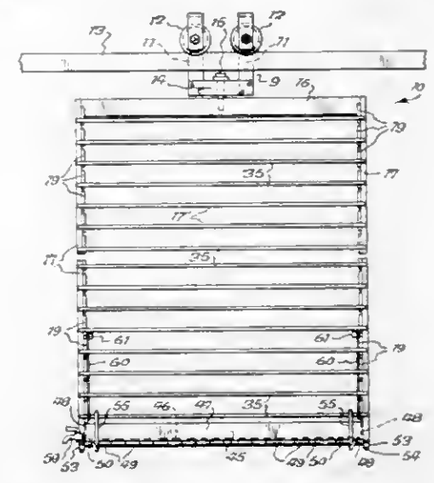
1. A device to carry out extemporary preparation of beverages with a liquid in doses, which passes through a glass-like capsule containing a charge to be diluted with the solvent, said capsule having an upper opening, a removable lower hollow extension and a thin covering plate for said opening, the device comprising: a first station to receive said capsule and to shear said extension thereof, including a capsule arrival chute; a second, beverage delivery station, including a seat for a beverage container and a unit which can be lowered to perforate at least one portion of said capsule and to cause a nozzle for the solvent to penetrate thereinto; a conveying collet having two diverging arms, angularly movable between said first and said second stations, and forming with said arms in a closed position an annular supporting seat for said capsule; a removable shearing unit including a blade to shear said capsule extension and an upper projection which can be removed into a retaining position of said capsule in said seat; collet movement means between said first and said second stations; means for temporarily diverging said collet in its return stroke from said second into said first station, for abandoning said capsule when exhausted; and means for checking the several operations in a desired sequence; further comprising an ejecting projection on each of said collet arms, with a tooth facing its own arm and acting on an edge of said capsule to pick it out from a semi-seat formed by the other arm.

4,029,004

MEAT CURING RACK

Edward Isenberg, 122 Jeanmoor Road, Tonawanda, N.Y. 14150

Filed Oct. 9, 1973, Ser. No. 404,403
Int. Cl.² A23B 4/04
U.S. Cl. 99—477 11 Claims



1. A meat smoking rack comprising a frame including a pair of spaced frame members, a plurality of pairs of shelf sections oriented vertically relative to each other, and bracket means for supporting each pair of said shelf sections on said frame members so that each of said pairs of shelf sections can be oriented to lie in substantially the same plane to form a substantially horizontal shelf or can be inclined to a more vertical position to cause the rack to have less width than when said shelf sections are oriented substantially horizontally.

4,029,005

STEMMING MACHINE

Edward J. Derderian, 4514 N. Wilson Ave., Fresno, Calif. 93704

Continuation-in-part of Ser. No. 435,829, Jan. 23, 1974, abandoned. This application Apr. 28, 1975, Ser. No. 571,916
Int. Cl.² A23N 15/02
U.S. Cl. 99—639 8 Claims

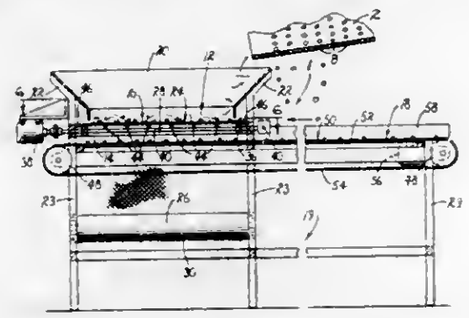
1. A stemming machine for separating raisins from mother stems comprising:

A. first means including a tumbler for fracturing raisin-bearing mother stems comprising a drum of a substantially open-end, cylindrical configuration supported for rotation about an inclined axis, and means defining in the wall of said drum a plurality of radially extended openings suitably dimensioned for accommodating gravitational discharge from the drum;

B. second means including an endless belt for receiving from said tumbler raisins adhered to fractured mother stems comprising a flat, open-mesh belt including a myriad of openings for accommodating gravitational discharge of raisins therethrough;

C. third means for separating raisins from fractured mother

stems including a vibrator comprising a horizontally oriented shaker frame disposed beneath the upper horizontal run of the belt of said open-mesh belt, in engaged relation therewith; and



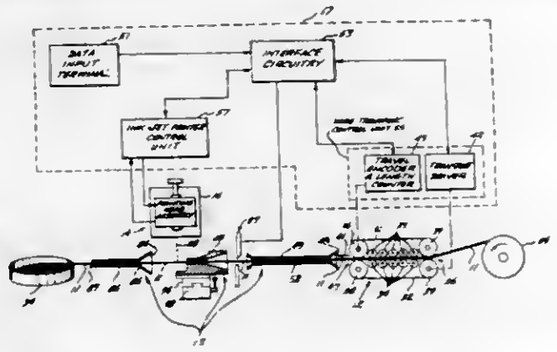
D. fourth means for receiving raisins separated from the mother stems including an endless belt angularly related to the open-mesh belt having an upper horizontal run passing beneath said shaker frame.

4,029,006

METHOD AND APPARATUS FOR PRINTING INDICIA ON A CONTINUOUS, ELONGATE, FLEXIBLE THREE-DIMENSIONAL MEMBER

Paul W. Mercer, Redmond, Wash., assignor to The Boeing Company, Seattle, Wash.

Filed June 26, 1975, Ser. No. 590,462
Int. Cl.² B41F 17/00
U.S. Cl. 101—35 20 Claims



1. In an apparatus for marking multi-character, alphanumeric, identification codes on a substantially continuous length of electrical wire or the like having a three-dimensional exterior surface, and including means for advancing said wire lengthwise past a printing station, the improvement comprising:

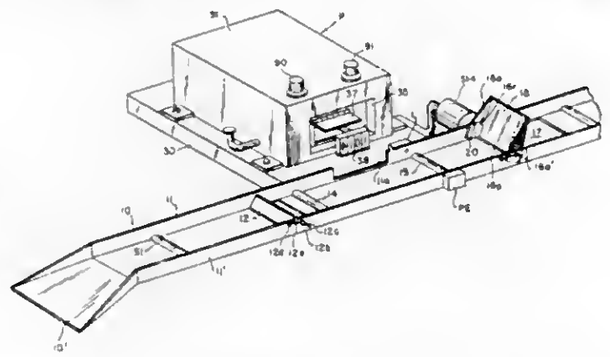
ink jet printing means disposed at said printing station for directing a selectively and electrostatically deflectable jet of droplets of printing ink to impinge and be deposited on the exterior surface of the advancing wire, said printing means being so arranged relative to the wire and being so responsive to the rate of longitudinal advancement of the wire as to cause said droplets of said printing ink to be deposited on the exterior surface of said wire in the form of alpha-numeric characters.

4,029,007

AUTOMATIC DATE-STAMPING SYSTEM FOR VEHICLES ENTERING PARKING AREAS

Armand L. Levinson; Donald W. Heinerichs, both of Baltimore, and George Ruck, Towson, all of Md., assignors to Armand L. Levinson, Baltimore, Md.

Filed Oct. 24, 1975, Ser. No. 625,566
Int. Cl.² B41F 17/00
U.S. Cl. 101—42 15 Claims



1. In a toll-operated parking area, in combination with blocking means against entry of an incoming automotive vehicle thereinto,

a. means for stamping the date of entry on the side-wall of a tire of the vehicle body in invisible ink, and

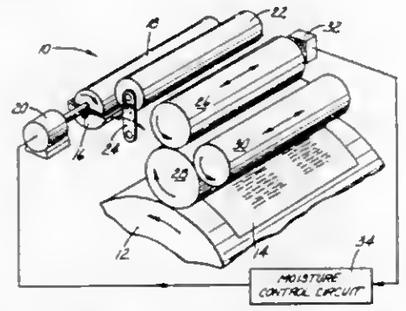
b. means for releasing said blocking means in response to the completion of the operation of said stamping means.

4,029,008

MOISTURE CONTROL SYSTEM

Saied Abd-Elrahman Mabrouk, Macedonia, Ohio, assignor to Addressograph Multigraph Corporation, Cleveland, Ohio

Filed May 24, 1976, Ser. No. 689,165
Int. Cl.² B41F 7/26, 7/36; B41L 25/02, 25/14
U.S. Cl. 101—148 23 Claims



1. A moisture system for a lithographic duplicator having a rotary master-carrying cylinder comprising:

a moisture sensing roll with a hydrophilic surface,

means for carrying moisture between said sensing roll and the surface of a master on the master cylinder including a roll with an ink-receptive surface,

means for maintaining on the surface of said ink-receptive roll a continuous film of lithographic ink,

means for driving said ink-receptive roll in a predetermined time relationship with the master cylinder of the duplicator,

means for presenting a supply of moisture to the ambit of said sensing roll surface at a controlled rate,

means for maintaining said sensing roll in nip-forming driven surface contact with said ink-receptive roll with the ink-receptive roll providing, through the medium of the ink and moisture at said nip, the sole driving agent for said moisture sensing roll, whereby the rotational speed thereof is dependent upon the extent of moisture appearing at the nip, and

control means operatively connected to said sensing roll for controlling the rate at which moisture is supplied by said moisture supply means as a function of the rotational speed of said moisture sensing roll.

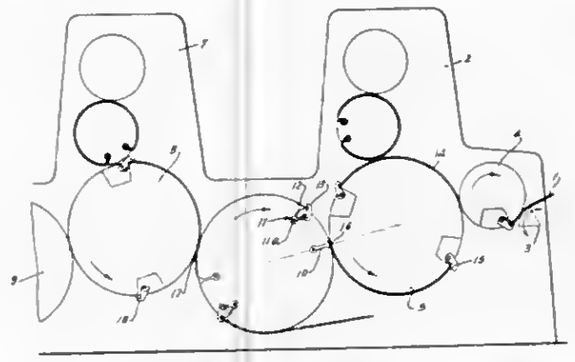
PRINTING MACHINE CONSTRUCTION

Wilfried Kühn, Dresden, and Wilfried Micklausch, Coswig, both of Germany, assignors to VEB Polygraph Leipzig Kombinat fur Polygraphische Maschinen und Ausrustungen, Leipzig, Germany

Filed July 17, 1975, Ser. No. 596,325
Int. Cl.² B41F 21/06
U.S. Cl. 101—231 6 Claims



1. In a printing machine, a combination comprising a first printing roller for printing on one side of a sheet; a second printing roller for printing on the opposite side of said sheet; and means for transferring said sheet from said first to said second printing roller, comprising a transfer roller intermediate said first and second printing rollers and forming with said first printing roller a tangent point, hollow suction bar means on said transfer roller extending over the axial length thereof and operative for engaging a trailing edge of said sheet by suction over the entire elongation of said trailing edge in the direction of said axial length of said transfer roller and for lifting said trailing edge off said first printing roller as said trailing edge travels through said tangent point, means mounting said suction bar means for movement between a position adjacent the periphery of said transfer roller and a position inwardly of said periphery, and combined suction-and-mechanical gripper system means for taking over said trailing edge from said suction bar means and having a row of individual suction grippers for receiving said trailing edge and moving it away from said suction bar means and a plurality of individual mechanical grippers adapted to engage and take over said trailing edge from said suction grippers only after said trailing edge has been received away from said suction bar means by said switch grippers so as to avoid interference between the latter and said mechanical grippers, whereupon said mechanical grippers present said trailing edge to said second printing roller so that it becomes the leading edge when said sheet is on said second printing roller.

4,029,010

ELECTROMAGNETIC PRINTING DEVICE

Horst Gürgen Deisting, Berlin, Germany, assignor to Pitney-Bowes, Inc., Stamford, Conn.

Filed Jan. 23, 1976, Ser. No. 651,775
Claims priority, application Germany, Jan. 31, 1975, 2504017; Apr. 16, 1975, 2516808
Int. Cl.² B41F 1/06
U.S. Cl. 101—316 8 Claims

1. A printing device of the type where a printing plate, such as a credit card, is used to imprint upon a printing assembly, the combination comprising:

a longitudinal housing having a laterally extending first opening and a second opening longitudinally spaced relative to one another;

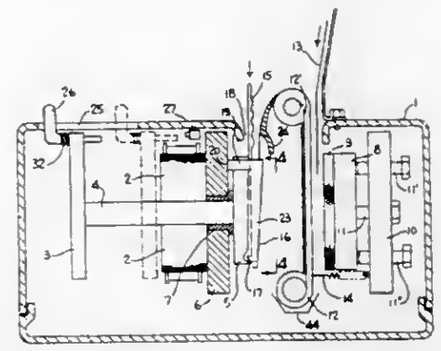
a longitudinally extending support rod slidably supported in said housing intermediate the longitudinal location of said openings;

a printing anvil secured to one end of said rod and having a flat surface generally in alignment with said first opening;

means for holding a printing plate adjacent to said printing anvil flat surface;

an armature plate secured to the second end of said rod in general alignment with said second opening;

a handle resiliently secured to said armature plate and having a portion which extends through said second opening whereby said rod may be manually slid within said housing toward said first opening;



an electromagnet securedly disposed within said housing intermediate said printing anvil and said armature plate;

a switch secured within said housing in general alignment with said handle whereby said switch is engageable by said handle to be closed thereby as said rod is slid within said housing toward said first opening;

means for enabling said electromagnet upon the closing of said switch thereby causing said armature plate to operatively engage said electromagnet;

a printing pad disposed within said housing and having a flat surface opposed to said flat surface of said printing anvil;

means disposed within said housing at said first opening for supporting an ink ribbon intermediate said printing anvil and said printing pad; and

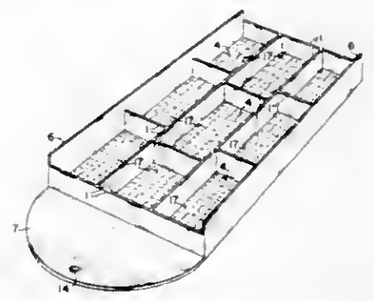
means for holding a printing assembly intermediate said printing anvil and said printing pad.

4,029,011

MULTI COLOR WELLS PROCESS

Ebbert Franklin Kurner, 2500 NE. 192 St., N. Miami, Fla. 33180

Filed May 16, 1975, Ser. No. 578,160
Int. Cl.² B41K 1/22, 1/46, 1/54
U.S. Cl. 101—330 1 Claim



1. A multi color printing apparatus including in combination:

a. a multi color ink tray having parallel end and side walls defining a rectangularly shaped closed area, a floor ex-

tending normal to said end and side walls, and a plurality of partitions extending normal to said floor and extending longitudinally and transversly within said closed area, said partitions, floor, end and side walls defining closed sub areas, said sub areas comprising printing ink compartments which contain printing ink, the ink in some of said compartments being of different color than the ink in other said compartments;

b. a cylindrical color pad roller having a surface layer composed of a foam-like ink retentive and ink absorbant material and having the periphery thereof divided by slots therein into a plurality of discrete areas, such that when said surface layer is developed onto a plane, said discrete areas correspond in size, shape and relative location with said sub-areas of said ink tray;

c. a cylindrical design roller having a design pattern upon the cylindrical surface thereof and having the same diameter and length as the color pad roller;

d. means for removably positioning said design roller and said color pad roller in side by side relationship with their longitudinal axes parallel to each other and with their outer surfaces in ink-transfering and rotation-transmitting contact with each other, said positioning means supporting each of said rollers for rotation about their longitudinal axes;

e. each of said design and color pad rollers being provided with notch marks on one end face thereof so that by alignment of said notch marks prior to rotation of the respective rollers, each spot on the periphery of said design roller will, upon rotation of said rollers, contact a predetermined spot on said color pad roller to ensure that the different color inks absorbed in said discrete areas of said color pad roller are constantly transferred to the same design areas;

f. whereby upon rotation of said color pad roller over, and in contact with said compartments, said ink tray compartments are operative to cooperate with said color pad slots and discrete areas respectively, to consistantly transfer a predetermined color ink contained in said compartments to said discrete areas; and

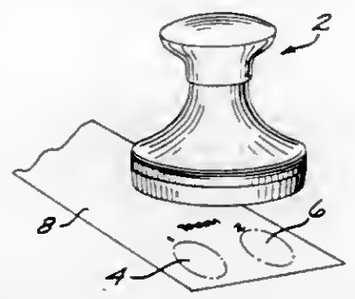
g. whereby upon rotation of said design roller periphery in contact with a workpiece the color pad roller will rotate in contact with said design roller and transfer ink to said design roller which will inturn transfer said ink to said workpiece.

4,029,012

TWO-PART INKLESS APPLICATOR FOR FINGERPRINTS

Jay Smith, III, Pacific Palisades, and Virgle L. Hedgcoth, Santa Monica, both of Calif., assignors to Identicator Corporation, San Bruno, Calif.

Filed Dec. 18, 1975, Ser. No. 642,165
Int. Cl.² B41K *1/00*; **B42D** *15/00*
U.S. Cl. 101—368 **45 Claims**



1. Identification apparatus for preparing a porous medium, such as a check and the like, to retain an identifiable fingerprint comprising:

first means for applying a quanitity of a first liquid developer solution to the medium, the developer solution as applied having sufficient film thickness on the porous medium to contact and adhere to substantially only the ridge pattern of a finger when the finger is applied to the coated medium; and

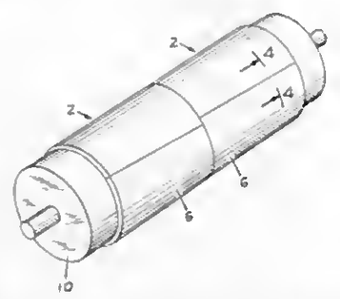
second means for applying a quanitity of a second liquid reagent solution to the medium, the second liquid reagent having a significantly higher penetration rate into the medium than the first liquid developer solution, the first liquid developer solution and second liquid reagent solution capable of chemically interacting to provide a perceivable coloraant product representative of a fingerprint ridge pattern whereby a finger can be first applied to the liquid developer coating on the medium to coat substantially only the ridge pattern and then subsequently applied to the liquid reagent on the medium to provide a colorant product representative of the fingerprint ridge pattern.

4,029,013

WRAP AROUND GRAVURE PRINTING APPARATUS

Harvey F. George, West Hempstead; Jitendra N. Shah, Hicksville, and Robert H. Oppenheimer, Glen Cove, all of N.Y., assignors to Gravure Research Institute, Inc., Port Washington, N.Y.

Continuation of Ser. No. 565,783, April 7, 1975, abandoned, which is a continuation of Ser. No. 398,707, Sept. 19, 1973, abandoned. This application May 11, 1976, Ser. No. 685,359
Int. Cl.² B41F *27/00*
U.S. Cl. 101—382 MV **6 Claims**



1. A rotogravure printing cylinder for use in rotogravure printing, including:

a cylindrical core;

a plurality of printing plates shaped to conform with the contour of the surface of said cylindrical core, each of said printing plates including the entire image to be printed on a single printed page and having a backing,

a layer of material suitable for etching engraving affixed to said backing, said layer having printing recesses formed therein for receiving printing ink;

said printing plates being magnetically held in a fixed position on said cylindrical core with said backings in contact with the surface of said cylindrical core, said printing plates being readily individually removable or replaceable as desired to change the image to be printed on a particular page of printing or the order of the printed pages;

said printing plates being mounted on said cylindrical core with adjacent printing plates in direct abutting contact with one another forming single joints therebetween, and with the edges of each printing plate which extend in the direction of the longitudinal axis of said cylindrical core being parallel to each other and disposed at an angle of approximately 5° relative to the longitudinal axis of said cylindrical core to minimize paper waste during printing.

4,029,014

SAFETY IGNITER FOR FLARES

Donald J. Cunningham, North Ogden, Utah, assignor to Thiokol Corporation, Newtown, Pa.

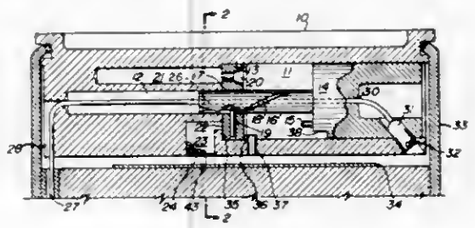
Filed Feb. 23, 1976, Ser. No. 660,097
Int. Cl.² F42B *4/12*
U.S. Cl. 102—35 **12 Claims**

1. A safety igniter for installation adjacent the ignition surface of an illuminant candle, for ignition thereof, in an aerial flare having a parachute and a lanyard operatively connecting the parachute to the safety igniter, the safety igniter comprising:

a housing having two contiguous bores of different diameters, creating a shoulder at their juncture, a duct leading from the bores to the exterior of the housing for passage of the lanyard, and a pyrotechnic-charge chamber having an inlet port communicating with the larger bore and a discharge port for directing flaming gases onto the ignition surface of the illuminant candle;

a pyrotechnic material in the pyrotechnic-charge chamber;

a primer-charge holder, movable in the larger bore;



a primer charger fixed to the primer-charge holder and being alignable with the inlet port of the pyrotechnic-charge chamber;

means for retaining the primer-charge holder adjacent the shoulder between the bores;

a firing-pin holder, movable in the larger bore, operatively attachable to the lanyard;

a firing pin fixed to the firing-pin holder and extending toward the primer-charge holder;

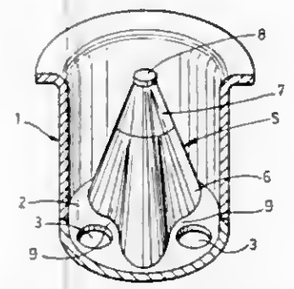
means for rotating at least the primer-charge holder, as the firing-pin holder is moved toward it by the lanyard, so that the primer charge, normally out of alignment with the inlet port of the pyrotechnic-charge chamber and with the firing pin, is brought into alignment therewith before being struck by the firing pin.

4,029,015

PRIMING CHAMBER FOR CARTRIDGES

Maurice Lachaussée, rue de l'Yser, 360, 4300 Ans, Belgium, and André Maigret, 4, Avenue de la Grange, Saint-Maur-des-Fosses, France

Filed Dec. 24, 1975, Ser. No. 644,084
Claims priority, application Belgium, July 8, 1975, 45083
Int. Cl.² F42C *19/10*
U.S. Cl. 102—45 **4 Claims**



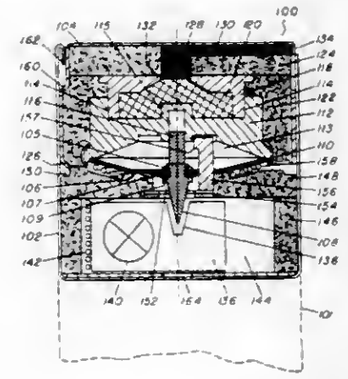
1. A priming chamber for a cartridge, comprising a cylindrical envelope having a flat bottom portion, an inwardly projecting anvil upstanding from said flat bottom portion, the flat bottom portion being formed with vent holes therein, said inwardly projecting anvil comprising a tapered lower portion integral with said flat bottom portion and a tapered upper portion having an upper outer flat end, said lower portion of the anvil having a plurality of ribs extending lengthwise of the anvil and spaced 120° from each other about said lower portion of the anvil.

4,029,016

PLURAL MODE FUZE

Lewis C. Cole, Chester, N.J., assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed June 29, 1976, Ser. No. 700,992
Int. Cl.² F42B *13/50*, *25/16*; **F42C** *9/00*
U.S. Cl. 102—69 **12 Claims**



1. A fuze providing delay arming, impact functioning, random time functioning and/or self-destruct functioning of a munition, which comprises in combination:

a cup containing a detonator charge and a safing and arming means;

a striker cup, slidably nested in said detonator containing cup;

a bimetallic spring delay module, fixedly mounted in said striker cup, comprising

a bimetallic spring containing a firing pin, and

a pyrotechnic charge for heating said spring, wherein said spring inverts by heat from a first stable position to a second stable position after expiration of a first predetermined delay period following ignition of said pyrotechnic charge, and reverts to said first stable position on cooling after expiration of a second predetermined delay period;

a biasing means intermediate said cups for moving the cups oppositely, whereby the fuze is converted from a safe condition to an armed condition via said safing and arming means;

a means for locking the bimetallic spring when it inverts, so that during such inversion the bimetallic spring overcomes said biasing means without contact of the integral firing pin with the detonator, and thereby moves and seats the striker cup against the detonator containing cup so as to prevent further movement of the striker cup toward the detonator; whereby

a. prior to the expiration of the first delay period required to invert the bimetallic spring, impact of the fuze with the ground overcomes said biasing means and thereby drives the firing pin into the detonator; and

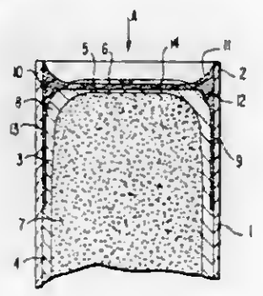
b. after the expiration of said first delay period, the bimetallic spring inverts while held by said locking means, thereby overcoming said biasing means and seating the striker cup against the detonator containing cup so as to prevent movement of the striker cup toward the detonator, whereby the fuze cannot function on impact with the ground but self-destruct functions when the bimetallic spring reverts on cooling after expiration of said second delay period and thereby drives the firing pin into the detonator.

4,029,017

PROPELLANT CHARGE IGNITER

Günter Hübsch, Kalchreuth; Hellmut Bendler, Stein, and Rudolf Stahlmann, Furth, all of Germany, assignors to Dynamit Nobel Aktiengesellschaft, Germany

Filed Feb. 6, 1976, Ser. No. 655,979
Claims priority, application Germany, Feb. 6, 1975, 2504906
Int. Cl.² F42C 19/08
U.S. Cl. 102—70 R 8 Claims



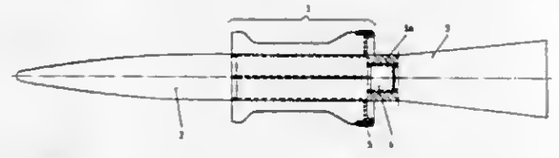
1. A propellant charge igniter which comprises an outer sleeve, open at a front end, an inner sleeve inserted within the outer sleeve and provided adjacent to the front end with a closed bottom portion having predetermined bursting zones, said inner sleeve containing a booster propellant charge, an expansion ring of a pressure-resistant material of low tensile strength arranged adjacent to the front end of the outer sleeve between the outer sleeve and a transition zone between the bottom portion and a wall portion of the inner sleeve.

4,029,018

SABOT FOR SUBCALIBRE PROJECTILE

Björn Ove Björnson, Karlskoga, Sweden, assignor to AB Bofors, Bofors, Sweden

Filed Aug. 11, 1975, Ser. No. 603,900
Claims priority, application Sweden, Aug. 21, 1974, 7410607
Int. Cl.² F42B 13/16
U.S. Cl. 102—93 4 Claims



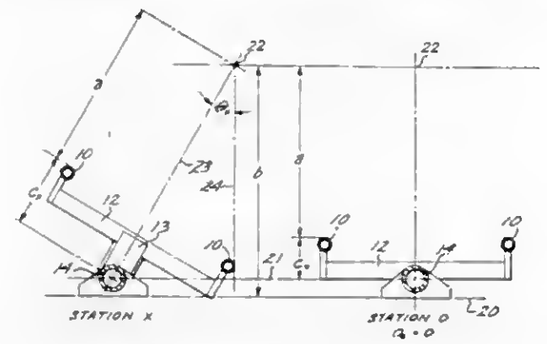
1. A unitary device adapted to be attached to a subcalibre projectile for performing the functions of centering the projectile in a gun barrel and obturating said barrel against expulsion gases developed in said barrel at the time of firing to effect propulsion of said projectile from said barrel, and so constructed that said unitary device is fractured into plural pieces by centrifugal and/or airflow forces imposed on said unitary device when said projectile has been fired, said unitary device comprising an elongated generally cylindrical tubular portion adapted to be disposed about said projectile in coaxial relation thereto, said cylindrical portion having a plurality of elongated generally axially directed slots therein disposed in spaced relation to one another, each of said slots extending completely through said cylindrical portion in a radial direction and each of said slots opening into the forwardmost end of said unitary device and extending in an axial direction rearwardly from said forwardmost end to a position closely adjacent, but terminating short of, the rearwardmost end of said unitary device, whereby said slots define therebetween a plurality of spaced, elongated, axially directed segments which have spaced, free ends at said forwardmost end of said unitary device and which segments are integrally joined to one another only at a comparatively thin unslotted portion of said device adjacent its said rearwardmost end, said unslotted portion of said device acting to hold said spaced segments in position relative to one another along said barrel before said projectile is fired, said unslotted portion including an integral, generally axially directed, threaded outer peripheral surface coaxial with and spaced from said projectile, a driving band disposed at the rearwardmost end of said device about said unslotted portion of said device and having an inner threaded surface in thread engagement with said threaded outer peripheral surface of said unslotted portion, said unslotted portion defining, as an integral part thereof, a surface located at the rearwardmost end of said device extending transverse to the axis of said projectile and operative to obturate said barrel when said projectile and said unitary device are inserted into said barrel for firing, the thickness of said unslotted portion in an axial direction being a small fraction of the axial length of said spaced segments whereby centrifugal and/or airflow forces acting on said elongated, spaced segments after said projectile has been fired are operative to effect a pivotal motion of the free ends of said segments about the rearwardmost end of said unitary device to break said unslotted portion of said unitary device into pieces and thereby effect separation of said device from said projectile.

4,029,019

TRACK FOR VEHICLES

William M. Watkins, West Covina, Calif., assignor to Walt Disney Productions, Burbank, Calif.

Filed Nov. 14, 1975, Ser. No. 631,892
Int. Cl.² B61B 12/00, 5/04; E01B 25/22
U.S. Cl. 104—124 6 Claims



1. A track for vehicles comprising a pair of spaced parallel track rails connected to a backbone member disposed beneath said track rails, said track having a plurality of curved sections in which the plane of said track rails extends at varying bank angles around a course line coextensive with and at a constant perpendicular distance thereto, the distance between the plane of said track rails and said backbone member in said curved sections varying in direct relationship to the bank angle of the curve, while the vertical distance between two parallel planes containing, respectively, said backbone member and said course line remains constant.

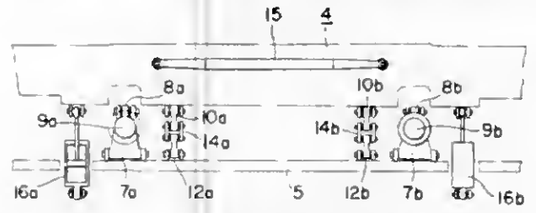
4,029,020

MAGNETICALLY LEVITATED VEHICLE WITH MODULE CONSTRUCTION OF SUSPENSION AND PROPULSION MEANS

Shinji Nakamura, Kawasaki, and Kiyoshi Mihirogi, Odawara, both of Japan, assignors to Japan Air Lines Co., Ltd., Tokyo, Japan

Filed Dec. 15, 1975, Ser. No. 640,781
Claims priority, application Japan, Dec. 13, 1974, 49-142442
Int. Cl.² B61B 13/08
U.S. Cl. 104—148 MS 5 Claims

1. A magnetically levitated vehicle comprising: a body; a plurality of modules arranged on said body symmetrically in two rows with reference to the longitudinal vertical plane traversing the body, each module including a frame and at least one attractive electromagnet for magnetically levitating said vehicle; and a suspension structure disposed between said body and each said module for connecting said body and said



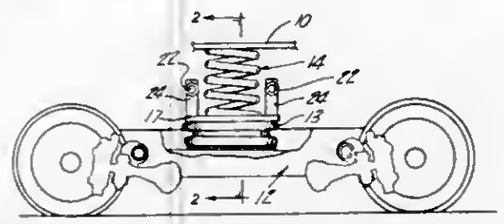
module, said suspension structure including a first link means for preventing rolling motion of said module relative to said body about the longitudinal axis of said electromagnet, and a second link means for preventing the longitudinal movement of said module relative to said body, wherein said first and second link means permit pitch, yaw, vertical and lateral movement of said module relative to said body.

4,029,021

COIL AND PNEUMATIC SPRING ASSEMBLY

John M. Peul, Holland, Pa., assignor to The Budd Company, Troy, Mich.

Filed Dec. 24, 1975, Ser. No. 644,274
Int. Cl.² B61F 5/06, 5/10, 5/14, 5/50
U.S. Cl. 105—199 R 1 Claim



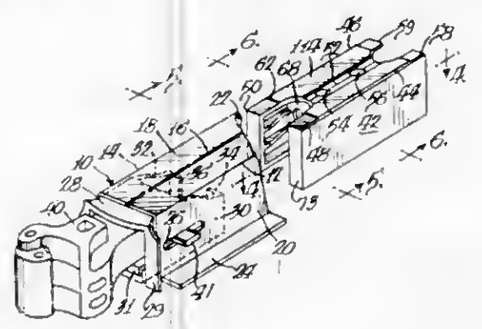
1. Spring means for supporting a vehicle body on a truck bolster, comprising in combination, pneumatic spring means carried by the truck bolster, an intermediate plate with projecting anchor means disposed on the upper end of both sides of said pneumatic spring means, coil spring means carried upon said intermediate plate and supporting a vehicle body, and transverse lateral stabilizing means between the truck bolster and the anchor means of said pneumatic spring means.

4,029,022

CENTER BRACE CASTING

Carl D. McClurg, Lockbourne, Ohio, assignor to Buckeye International, Inc., Columbus, Ohio

Filed July 7, 1975, Ser. No. 593,197
Int. Cl.² B61D 17/00
U.S. Cl. 105—420 3 Claims



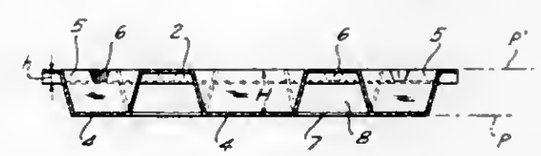
1. An elongated center brace for use in a railway hopper, gondola or box car having an associated truck centerline spaced a respective distance dependent on the type of car from a striker assembly carried by a center sill associated with said car, the improvement comprising, in combination, rear draft lugs on said center brace spaced longitudinally along said center sill a standard distance from said striker assembly irrespective of the type of car, a first king pin hole in said center brace for receiving a truck king pin, said first king pin hole being spaced longitudinally of said rear draft lugs a first predetermined distance corresponding to one type of car, a second king pin hole in said center brace positioned longitudinally of said first king pin hole and in alignment therewith at a second predetermined distance from said rear draft lugs corresponding to another type of car for receiving a truck king pin spaced at said second distance from said rear draft lugs, said first king pin hole being adapted to receive a truck king pin associated with a hopper car and said second king pin hole being adapted to receive a truck king pin associated with a box or gondola car while said striker assembly is retained at said standard distance from said rear draft lugs, and said center brace being formed substantially symmetrical about a horizontal plane so that said center brace may be secured to said center sill with either side up and still permit use of either of said first and second king pin holes.

4,029,023

FOUR-WAY PALLET

Horst Rosewicz, and Werner Klein, both of Ludwigshafen, Germany, assignors to Furnier- und Sperrholzwerk Werzalit-Pressholzwerk J. F. Werz Jr. KG, Oberstenfeld, Germany

Filed Feb. 24, 1976, Ser. No. 661,027
Claims priority, application Germany, Aug. 20, 1975, 2440242
Int. Cl.² B65D 19/24
U.S. Cl. 108—51.1 10 Claims



1. A four-way pallet comprising a generally rectangular unitary plate having two pairs of opposite edges and two opposite faces, said plate being unitarily formed inwardly of each edge of one of said pairs with a row of three separate edge bosses projecting and tapering from one of said faces and spaced apart in a direction parallel to said edges of said one pair, said bosses constituting feet for said plate and defining a pair of parallel ways across said plate at said one face and inset from and perpendicular to said direction, said plate further being formed between and parallel to said rows with a row of two separate middle bosses projecting and tapering from said one face and each formed with apertures in line with said ways, said middle bosses being spaced apart in said direction and offset to said edge bosses, whereby tines of a lift fork can pass under said pallet standing on said bosses between said edge bosses and through said apertures of said middle bosses.

4,029,024

WORK BENCH STRUCTURE

David Kiltzky, 5107 N. Francisco, Chicago, Ill. 60625

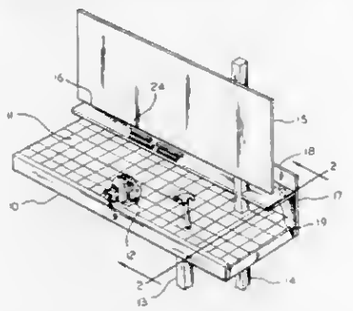
Filed Apr. 16, 1976, Ser. No. 677,704
Int. Cl.² A47B 57/00
U.S. Cl. 108—60 10 Claims

1. A workbench structure comprising:
a substantially horizontal continuous work surface;
support means extending through and supporting said work surface;
first partition means fixedly attached to said support means;
said first partition means having a lower edge,

said first partition means being positioned above said work surface a sufficient distance so as to allow the passage of handicraft items beneath said lower edge to and from said work surface;

second partition means attached to said work surface,

said second partition means having an upper edge extending



above said lower edge of said first partition means, so as to prevent vision past said first and second partition means,

said first and second partition means being spaced a sufficient distance apart horizontally so as to allow continuous access over said second partition means and beneath said first partition means to said work surface.

4,029,025

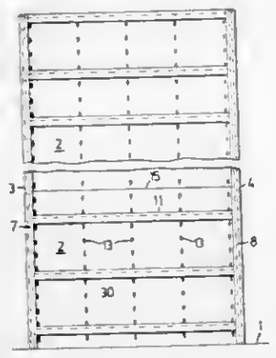
SHELVING STRUCTURE

Harald Lundqvist, En Quarroz, CH-1807 Blonay, Switzerland

Filed June 4, 1976, Ser. No. 692,769

Int. Cl.² A47B 9/00

U.S. Cl. 108—108 **8 Claims**



1. A shelving structure comprising two upright side-pieces, a back plate and a plurality of movable shelves each of which comprises a thin sheet whose leading edge is reinforced by a reinforcing means having the form of a generally horizontal sheet-metal channel member mounted on said shelf, the thickness of which channel member is greater than the thickness of the shelf and which is securedly clamped thereto, said shelf being connected to the side pieces at the ends of the sheet-metal channel member and to the back plate at the rear edge portion of the shelf, characterized in that vertical sheet-metal channel members are mounted on leading edges of said side-pieces to laterally reinforce such edges; supporting means connect the ends of said horizontal sheet-metal channel member to said vertical channel members, each supporting means being received in a recess in said horizontal channel member and being arranged for minimum play to resist relative separation between the shelf and the side pieces; means are provided for holding the back plate pressed against the rear edges of the shelves so as to reinforce the back plate by means of the shelves fixed by the vertical sheet-metal channel members of the side pieces, said means imparting to the shelving structure the requisite diagonal rigidity, the rigidity of said back plate being otherwise insufficient to support the trailing edges of the shelves.

4,029,026

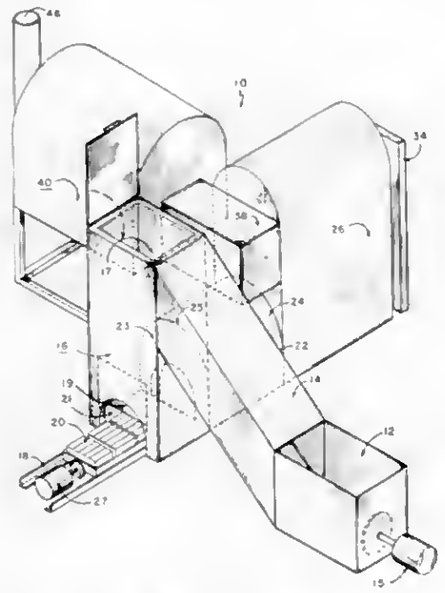
INCINERATOR

Lludas Normantas, Hiram, Maine 04041

Filed Mar. 18, 1976, Ser. No. 629,758

Int. Cl.² F23G 5/00

U.S. Cl. 110—8 A **7 Claims**



1. An improved incinerator for complete combustion of waste materials comprising:

a loading hopper for the insertion of waste materials into said incinerator,

a loading chute operably connected to said hopper for loading said waste materials from said hopper to said incinerator;

a loading chamber operably connected to said loading chute to receive waste materials for movement into said incinerator;

means to force said waste material from said hopper through said chute and into said loading chamber;

an elongated, inverted U-shaped structure serving as a section of a primary combustion chamber, one end of which opens directly into said loading chamber;

a second elongated, inverted U-shaped structure having a wider vase and greater height than said first structure, but shorter than the first;

said second structure positioned partially over said first structure and having one end wall connecting to said first structure and one full end wall;

said second structure serving as the termination of said primary combustion chamber;

a set of tracks running the length of said loading chamber and said primary combustion chamber, at the base thereof, entering through said loading chamber and exiting through the end wall of said second structure;

trays to move along said tracks to carry waste materials from said loading chamber through said primary combustion chamber;

means to move said trays along said tracks,

dampers to control the flow of air at the openings through which said trays enter and exit on said tracks;

a vapor collection chamber in communication with said second U-shaped structure to receive the vapors emanating therefrom;

an air baffle in communication with said collection chamber to filter said vapors, collect any residual particulate matter and cool said vapors;

a stack in communication with the opposite end of said air baffle to permit the flow of vapors into the atmosphere.

4,029,027

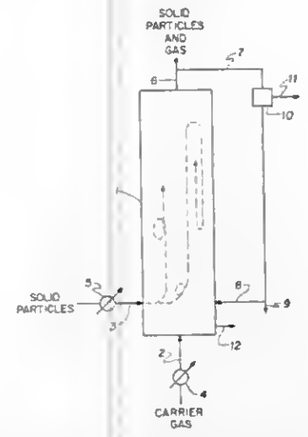
METHOD FOR GENERATING HEAT

Robert H. Smith, Plano, Tex., assignor to Atlantic Richfield Company, Los Angeles, Calif.

Filed Oct. 20, 1975, Ser. No. 623,614

Int. Cl.² F23B 7/00

U.S. Cl. 110—28 J **9 Claims**



1. A method for generating heat from oil shale particles that carry a deposit of carbon, comprising providing an upstanding heating chamber, heating said particles in said chamber to cause combustion of said carbon, lifting said particles during said heating from a lower portion to an upper portion of said chamber using a carrier gas and removing a substantial majority of said particles from said upper portion of said chamber, controlling said carrier gas so that at any given time during said lifting step a substantial amount of said particles fall downwardly for a finite distance thereby causing internal backmixing of heated falling particles with relatively cooler rising particles, said backmixing taking place at varying locations over essentially the full length of said chamber between said lower and upper portions, said carrier gas being introduced into said chamber at a rate of at least 10 feet per second at a pounds of particles/cubic foot of carrier gas ratio of from about 2/1 to about 20/1, and said particles being predominantly less than 60 mesh.

4,029,028

DEVICE FOR METERING GRANULAR MATERIAL

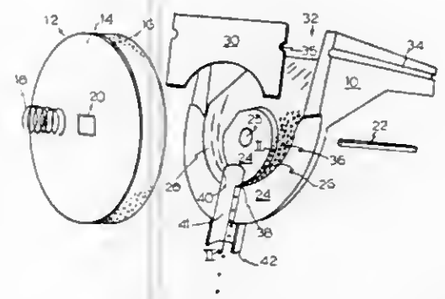
Peter Murray Griffiths, 19 Cuba St., Marton, New Zealand

Filed Apr. 19, 1976, Ser. No. 678,038

Claims priority, application New Zealand, Apr. 18, 1975, 177280

Int. Cl.² A01C 5/04, 7/12

U.S. Cl. 111—86 **16 Claims**



1. A device for metering granular material comprising a non resilient solid member having a slot passing therethrough defining a passage and a complementary conveying rotor in association therewith,

said slot being open at both ends and along at least a portion of one side over the length thereof, one said open end of said slot having a smaller cross sectional area than the other said open end, said open end of smaller cross sectional area being a discharge orifice, said open end of larger cross sectional area being a feed orifice,

said rotor having a resilient surface and being mounted to rotate relative to said non resilient solid member, said resilient surface being engageable with said open side portion of said slot throughout each rotation of said rotor,

the arrangement being such that in use said rotor frictionally engages granular material in said slot to convey said granular material towards said discharge orifice in said slot whereby said granules are arranged for metered discharge.

4,029,029

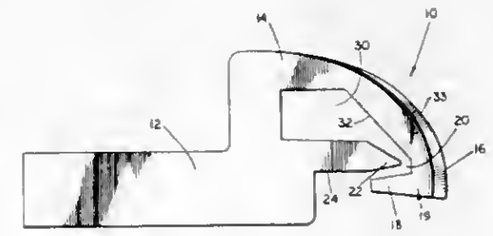
METHOD AND APPARATUS FOR TUFTING HIGH AND LOW CUT PILE IN THE SAME ROW

Aud J. Franks, Rocky Face, and Harold E. Hawkins, Chatsworth, both of Ga., assignors to Patrick F. Henry, Sr., Atlanta, Ga.

Filed July 22, 1974, Ser. No. 490,763

Int. Cl.² D05C 15/22, 15/32

U.S. Cl. 112—79 R **25 Claims**



1. In a tufting machine: means for feeding a base fabric in one direction, a needle for carrying yarn to penetrate the base fabric and form long and short loops therein, means for reciprocating the needle thru the base fabric, means for feeding yarn to said needle and means for controlling said yarn including tensioning or drawing thereof to form longer and shorter yarn loops, a looper element mounted on said machine having an end facing in the direction opposite to the direction of the fabric feed for reciprocation to enter a succession of long and short loops and said end comprising an upper forwardly extending portion terminating in an inwardly turned bottom member, a bottom projecting finger defining with said bottom member an entrance for short loops along the bottom of the looper, there being a space between the bottom member and said projecting finger for short yarn loops to pass through into said space when the looper moves rearwardly with respect to the fabric in the same direction as the direction of movement of the feeding of the fabric, said entrance permitting the passage into the space of a short loop through the entrance when sufficient tension is exerted upon the loop, and means for reciprocating said looper element.

4,029,030

PATTERNED CUT PILE TUFTING MACHINE

Randel P. Smith, Chattanooga, Tenn., assignor to The Singer Company, New York, N.Y.

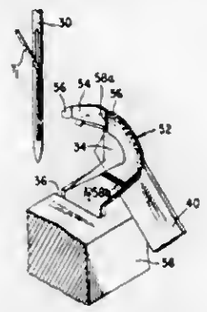
Filed May 17, 1971, Ser. No. 144,038

Int. Cl.² D05C 15/34

U.S. Cl. 112—79 A **2 Claims**

1. In an apparatus for producing patterned cut pile fabrics, a yarn carrying needle means supported for endwise movement for penetrating a base fabric to deposit loops of yarn therethrough, looper means for seizing the loop of yarn during the withdrawal of the needle through the base fabric, cutting means cooperating with said looper means for cutting the loop of yarn and operable for cutting the loop substantially immediately after it is seized by said looper, means for selectively backrobbing one leg of the cut loop whereby the cut loop is

formed with one relatively long leg and one relatively short leg, and said looper means including a looper member and an oscillating looper support means, said looper member disposed in a slot in said oscillating looper support means, a clip member disposed in the same slot as said looper member, said clip member being resilient and having a bill portion including a retaining portion, and a bent portion disposed away from the free end of the bill, said retaining portion disposed in close



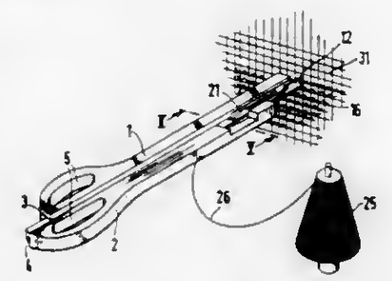
juxtaposition with a yarn carrying portion of the looper member for retaining one leg of a cut loop between said clip member and said looper member such that when the loop is cut a leg thereof connected with the needle will be yieldably restrained by said retaining portion of the clip member and said looper member, said bent portion forming a hollow space between said bill portion and said looper member to permit disposal of lint and loose fibers picked up from the yarn.

4,029,031

DEVICE FOR PROVIDING RUGS AND THE LIKE WITH TUFTS

Hartmut Scholz, Wolfsteiner Strasse 10, 8501 Allersberg, Germany

Filed Mar. 10, 1976, Ser. No. 665,436
Claims priority, application Germany, Mar. 14, 1975, 2511266
Int. Cl.² D05C *15/06*
U.S. Cl. 112—80 **25 Claims**



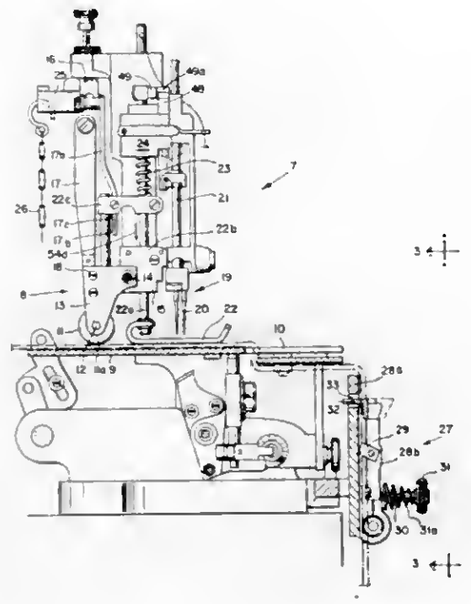
15. Apparatus for manually tufting rugs and the like comprising, in combination: two arms located next to each other; dovetailed joint means for connecting said arms to each other and guiding said arms movably relative to each other in a longitudinal direction between two extreme positions; stop means for defining said two extreme positions; leading contact surface means on each of said arms for alternately contacting the base fabric; a needle carried by one of said arms and projecting from its respective contact surface means, said needle penetrating the base fabric and holding thread; a blade carried by the other arm and projecting from its respective contact surface means, said blade cutting the thread after formation of a loop at the head of the loop; a guidance member for the other arm, said blade having means engaging said guidance member for opening said blade; closure means on said blade and triggered in the leading extreme position of the arm carrying said blade; and spring means; said closure means closing said blade under spring action when triggered in said extreme position.

4,029,032

TIE SEWING MACHINE

Joseph M. Medynski, 18 Park St., Ramsey, N.J. 07446, and John B. Medynski, 680 Knollwood Road, Franklin Lakes, N.J. 07417

Filed May 13, 1976, Ser. No. 686,171
Int. Cl.² D05B *23/00*
U.S. Cl. 112—121.22 **8 Claims**



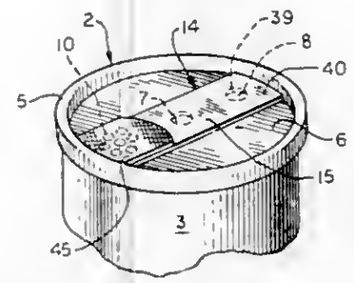
1. A sewing machine comprising in combination: a substantially flat base plate having a substantially planar upper surface with at least one needle hole therein; needle means for aligning a needle with said needle hole and for sewing feed-material passed along said planar upper surface over said needle hole beneath a needle end of said needle; fabric-advancing roller means for providing a roller surface; means biasing said roller surface angularly forwardly toward said needle means and downwardly toward said planar upper surface; a presser foot drive and gear means for driving the needle axially along a longitudinal axis in directions in said needle hole and for lifting said pressure foot intermittently and for concurrently driving rotatably said roller surface of the roller means advancingly of a lower surface of the roller surface in a direction away from said needle hole, the lower surface of said roller being advanceable of said feed-material rearwardly during a phase in which the needle and foot are spaced-above the needle hole such that the feed-material is advanceable beneath the needle end; feed-material guide means for guiding the feed-material from a predetermined forward point rearwardly along a linear path toward said needle hole and said fabric-advancing means, and for placing a predetermined restraining torque on the feed-material, the feed-material guide means including spring-biased structure having a pressure-applying face shaped and positioned such that said restraining torque is lesser for a narrow width than for a wide width at differing points axially along and of said feed-material; and the flat base plate, the needle means, the fabric-advancing roller means, the drive and gear means, and the feed-material guide means being mounted in fixed relationships to one-another.

4,029,033

CONVENIENCE OPENING OF CONTAINERS FOR LIQUID PRODUCTS

Joseph E. Kerwin, Western Springs, and Paul M. Erlandson, Palos Park, both of Ill., assignors to The Continental Group, Inc., New York, N.Y.

Division of Ser. No. 507,036, Sept. 18, 1974. This application Oct. 14, 1975, Ser. No. 622,302
Int. Cl.² B67B *7/00*
U.S. Cl. 113—121 C **8 Claims**



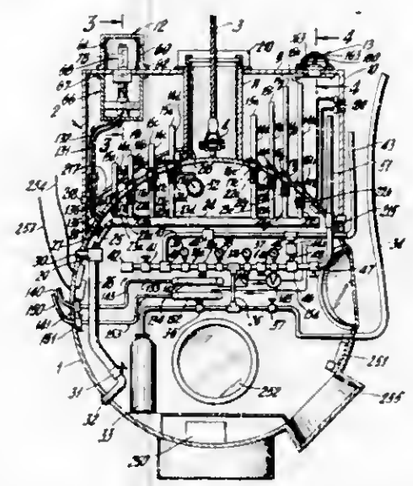
1. A method of attaching a tape over plural closely spaced small openings in a metal container wall comprising:
the steps of applying an enamel to the wall,
then punching said openings in said wall to thereby expose uncoated metal edges forming the margins of said openings,
then applying a film of adhesive to the wall in areas about respective openings,
then applying a tape at least a portion of which is thermoplastic material to the wall,
then pressing the tape with the thermoplastic material covering the openings and applying sufficient pressure to extrude the thermoplastic material as bosses into respective openings each having a relatively thick disk-shaped center section and torus-shaped marginal portion pressed within the edges of respective openings to form relatively thick pressure-resistant islands within the openings.

4,029,034

METHOD AND APPARATUS FOR BUOYANCY CONTROL OF SUBMERGIBLE CHAMBERS

Burton Hoster Mason, P.O. Box 504, Covington, La. 70433

Filed Feb. 25, 1976, Ser. No. 661,148
Int. Cl.² B63G *8/22*
U.S. Cl. 114—16 E **12 Claims**



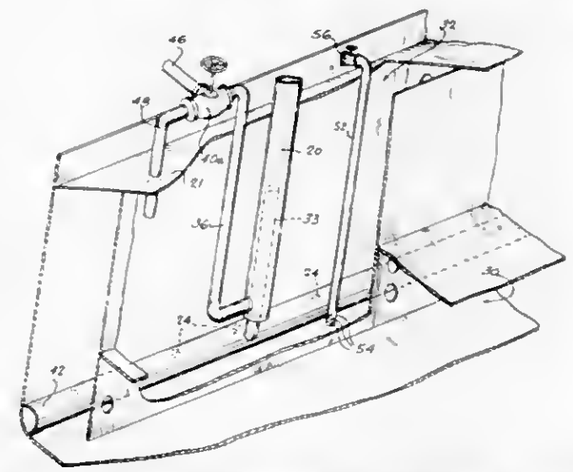
1. In combination with a submergible apparatus comprising a chamber, an apparatus for controlling the bouyancy of the first said apparatus, comprising a tank mounted on the chamber, fluid conduit means comprising a plurality of pipes extending vertically upward into said tank for communicating from the interior of said tank to the outside ambient environment below said tank, each of said pipe means having valve means operatively mounted therewith, and means within said chamber to selectively actuate each of said valve means, gas conduit means connected to said tank for providing a gas thereto, and discharge valve means mounted on said tank to discharge a gas therefrom to the outside ambient environment above said tank, whereby gas is supplied through the gas condit means and displaces water in the tank through the fluid conduit means until the level of the water in the tank reaches about the top of the fluid height in one of the pipes.

4,029,035

SHIP'S HULL AND METHOD OF BUBBLING HOT GAS THEREFROM

William H. German, 20180 Lakeshore Rd., Baie d'Urfe, Quebec, Canada (H9X 1P7)

Filed Apr. 13, 1976, Ser. No. 676,429
Int. Cl.² B63B *1/38, 35/08*
U.S. Cl. 114—67 A **13 Claims**



9. In combination, a ship's hull having sides and a plurality of small holes arranged in at least one row located well below the ship's water line and extending along said sides, and apparatus for generating and supplying hot compressed gas to said holes on a continuous basis at a gas pressure sufficient to produce continuous gas bubbling from said holes for the purpose of assisting in ice-breaking in ice-laden waters using the effect of said bubbles at the surface of the water, said apparatus comprising:
a. at least one chamber having an inlet and an outlet;
b. means for continuously supplying air under pressure to said at least one chamber through said inlet;
c. mixing means for continuously mixing fuel with said compressed air introduced into said chamber;
d. ignition means for igniting said fuel/air mixture in said chamber to continuously generate hot gas at a pressure at least as high as said pressure sufficient to produce gas bubbling; and
e. pipe means for receiving said hot gas continuously issuing from said outlet of said at least one chamber and for supplying said gas directly to said holes in the hull whilst maintaining the pressure of said gas at least as high as said sufficient pressure at said holes.

4,029,036

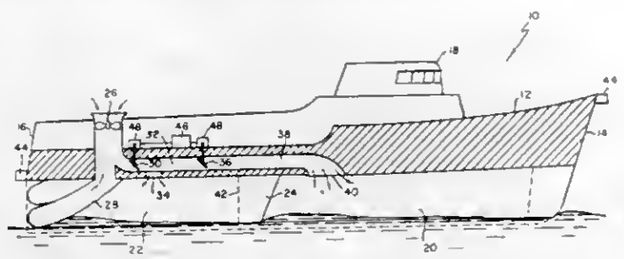
STABILIZATION AND MOTION ALLEVIATION OF AIR CUSHION BORNE VEHICLES

Allen H. Magnuson, 2014 Hanover St., Silver Spring, Md. 20910

Filed Mar. 23, 1976, Ser. No. 669,793
Int. Cl.² B63B *1/34*
U.S. Cl. 114—67 A **8 Claims**

1. An automatic pitch stabilization and motion alleviation system for air cushion borne vehicles comprising:

means on the vehicle hull for supplying pressurized air to the air cushion system comprising a forward and an aft air cushion compartment, and a seal system means for sealing said air cushion system, said seal system means further comprising transverse seal means for dividing the air cushion into the forward air cushion compartment and the aft air cushion compartment, side seal means for sealing the sides of the air cushion compartments, bow seal means for sealing the bow of the forward air cushion compartment, and stern seal means for sealing the stern of the aft air cushion compartment;



means for causing a controllable pressure drop from said aft air cushion compartment to said forward air cushion compartment, said means further comprising an air ducting system feeding pressurized air to the seal sytem means and to the forward and aft air cushion compartments, a control valve operating in said ducting system and regulating the differential over-pressure of said seal means, bow seal means, and stern seal means relative to the aft air cushion compartment, and a pressure differential control valve operating in said ducting system regulating differential over-pressure of the aft cushion compartment relative to the forward cushion compartment.

4,029,037

PROCESS FOR REINFORCING PLASTIC MATERIAL AND PRODUCTS THEREFROM

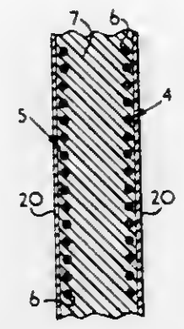
Brian Patrick Hogan, Milton Keynes, England, assignor to Aquatech Composite Materials Limited, United Kingdom

Filed Sept. 16, 1975, Ser. No. 613,920

Claims priority, application United Kingdom, Sept. 18, 1974, 40748/74

Int. Cl.² B63B *3/38*; **B32B** *5/12*

U.S. Cl. 114—127 **11 Claims**



1. A plastics structure comprising a core of a foamed plastics material having two opposite surface, wherein there is contained in a surface layer of said foamed plastics material at least one array of parallel spaced high tensile steel reinforcing elements having a diameter of from about 0.040 to about 0.125 inches and a yield strength of not less than 200,000 psi to which the foamed plastics material adheres, said wires located at not less than 0.06 inches below the surface layers the said surface layer having a smooth outer surface and the high tensile steel reinforcing elements being aligned substantially parallel to the said outer surface.

9. A structure according to claim 1 wherein the structure is the centre board for a sailing dingy.

4,029,038

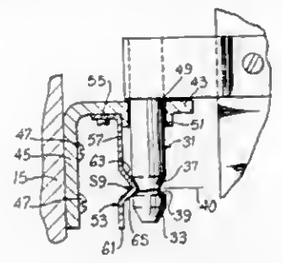
RELEASABLE RUDDER LOCK

Kurt J. Pfahl, 3077 Hayes Ave., Costa Mesa, Calif. 92626

Filed Dec. 22, 1975, Ser. No. 642,908

Int. Cl.² B63H *25/06*

U.S. Cl. 114—162 **8 Claims**



1. An apparatus for pivotally mounting a rudder on a boat, said apparatus comprising:

a bracket attachable to the rudder;

a pintle;

means for attaching the pintle to the bracket with at least a portion of the pintle projecting away from the bracket;

a mounting member attachable to the boat and having an aperture sized to receive the pintle, said pintle being insertable in said aperture to at least assist in mounting the rudder for pivotal movement relative to the boat;

a resilient lock element carried by said mounting member and engageable with said pintle when the pintle is received in said aperture;

cooperating surface means on said resilient lock element and said pintle for retaining the pintle against withdrawal from the aperture of the mounting member, said resilient lock element being resiliently movable to allow withdrawal of the pintie from the aperture; and

said mounting member having a collar at least partly defining said aperture and said resilient lock element having an attaching flange and a resilient arm, said attaching flange being attached to the mounting member and a portion of said arm being closely adjacent said collar, and said arm and said collar extending from said mounting member in the same general direction.

4,029,039

MOORING MEANS, PARTICULARLY FOR CARRYING OUT PRODUCTION TESTS FOR GAS AND OIL DRILLING ON THE HIGH SEAS

Willem Jan van Heijst, Monte-Carlo, Monaco, assignor to N.V. Industrieele Handelscombinatie Holland, Rotterdam, Netherlands

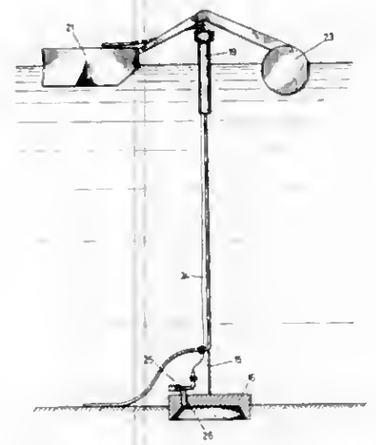
Filed Oct. 31, 1975, Ser. No. 627,913

Claims priority, application Netherlands, Nov. 5, 1974, 7414432

Int. Cl.² B63B *21/52*

U.S. Cl. 114—230 **6 Claims**

1. Mooring means comprising a vessel, rigid arms pivotally mounted on the vessel for vertical swinging movement relative to the vessel about a horizontal axis, a buoy that intersects the surface of the water with a small cross section and that has a height substantially greater than its width and that has a taut but flexible connection with an anchor on the sea floor located directly vertically below the buoy under normally calm sea conditions, universal joint means between the arms and the



buoy, and a float connected to said arms at a distance from the buoy and floating in the water.

4,029,040

ANCHOR

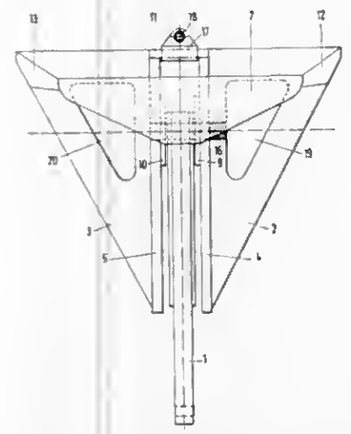
Petrus Jozef Klaren, Frankenrade 3, Nieuwerkerk a/d, IJssel, Netherlands

Filed Nov. 4, 1975, Ser. No. 628,765

Claims priority, application Netherlands, Nov. 6, 1974, 7414485

Int. Cl.² B63B *21/38*

U.S. Cl. 114—304 **13 Claims**



1. An anchor in particular for anchoring special purpose vessels, dredgers, off-shore drilling platforms and the like, said anchor having two flukes arranged on both sides of an axis of symmetry so as together to form a delta shape, a shank mounted between said flukes for pivoting movement in a plane containing said axis of symmetry, and trim plates or head faces disposed on either side of the flukes, the width of said trim plates being less than the total width of the flukes, characterized in that the outer ends of both trim plates are connected to the outer edges of the flukes by means of stabilizing plates which enclose an acute angle both with the plane of the flukes and with the pivot plane of said shank, the width of the stabilizing plates increasing toward the flukes.

4,029,041

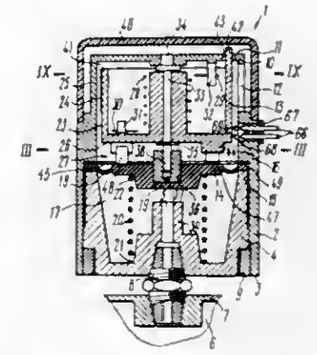
BLOCKAGE INDICATOR FOR INTERNAL COMBUSTION ENGINE AIR CLEANER ELEMENT

Eduard Matveevich Genshpring, ulitsa 2-Gazovaya, S, kv. 316; Zigmund Genrikhovich Bljumshtein, ulitsa Pavljukhina, 85, kv. 25, both of Kazan; Veniamin Evnovich Maev, Chernomorsky bulvar, 4, kv. 266; Fedor Alexeevich Bondarenko, Presnensky val, 40, kv. 101, both of Moscow; Anatoly Lvovich Gutman, ulitsa Eniseiskaya, 6, kv. 14, and Vladimir Alexandrovich Presman, pereulok Kozlova, E, kv. 10, both of Minsk, all of U.S.S.R.

Filed Jan. 8, 1976, Ser. No. 647,361

Int. Cl.² G01L *19/12*

U.S. Cl. 116—114 AE **17 Claims**



1. A blockage indicator for an internal combustion engine air cleaner element, comprising: a cylindrical housing; a bottom head at one end of said housing, said bottom head having a hole for the indicator to communicate with the air cleaner involved; at least one ported portion provided on the side wall of the housing, in close proximity to an other end of said housing; a resilient member constructed in the form of a spring-loaded diaphragm, secured around the periphery of said housing and being inside the housing; a sealed-off chamber being defined between said diaphragm and said bottom head and arranged to communicate with the air cleaner; a stationary shaft mounted on said other housing end axially in line with the housing axis; an indicator drum accommodated inside said housing and mounted on said stationary shaft, the bottom wall of said indicator drum facing toward said diaphragm; a locating element fixing said indicator drum axially in said housing; painted signalling areas on an external side surface of said indicator drum; a spring mounted inside said indicator drum and adapted to turn the indicator drum to a warning position in which the painted signalling surface shows through the housing ported portion; a locking device to hold said indicator drum in position relative to said housing, said locking device being located between the indicator drum bottom wall and the diaphragm and being arranged to interact with the diaphragm and the indicator drum in such a manner as to lock the indicator drum in a normal position where the painted signalling surface of the indicator drum does not show through the housing ported portion.

4,029,042

DIFFERENTIAL PRESSURE INDICATOR DEVICE

Charles Juhasz, Caldwell, N.J., assignor to Aircraft Systems Corporation, West Caldwell, N.J.

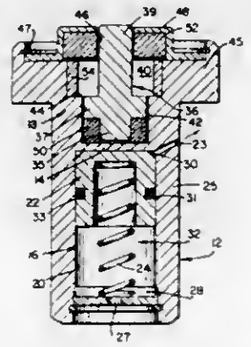
Filed Feb. 17, 1976, Ser. No. 658,369

Int. Cl.² G01D *13/00*

U.S. Cl. 116—114 PV **8 Claims**

1. Differential pressure indicator device for use with high and low fluid pressure sources comprising: a casing having a relatively thin partition wall dividing the casing interior into an indicator housing and fluid chamber, magnetically soft sealing means axially movable in said fluid chamber dividing said fluid chamber into a first chamber adaptable for connection to said high fluid pressure source and a second chamber adaptable for connection to said low fluid pressure source, an indicator

element axially movable in said indicator housing having a first permanent magnet secured to said indicator element, and



a second permanent magnet in said indicator housing spaced from said partition wall.

4,029,043

POSITION INDICATOR FOR VALVES AND THE LIKE

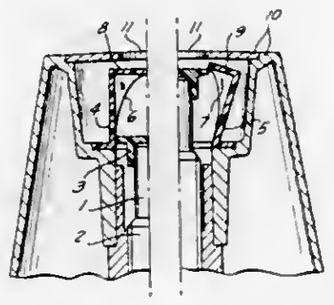
Jürgen Nothdurft, Behringersdorf, Germany, assignor to Klein, Schanzlin & Becker Aktiengesellschaft, Frankenthal, Germany

Filed Dec. 8, 1975, Ser. No. 638,891

Claims priority, application Germany, Dec. 10, 1974, 2458279

Int. Cl.² F16K *37/00*

U.S. Cl. 116—125 **13 Claims**



1. In a valve, a combination comprising a valve housing having a fluid-flow passage and an opening spaced from said passage; means for changing the effective cross-section of said fluid-flow passage, including a portion movable relative to said passage; and indicating means visually observable through said opening for indicating the position of said portion relative to said passage and thereby the effective cross-section of said passage, said indicating means comprising a member displaceable in a path substantially normal to the plane of said opening as a function of the movement of said portion, at least one jaw extending at least partially about said member in elastically yieldable contact therewith, and cam means for yieldingly and steplessly displacing said jaw relative to said member to a plurality of intermediate positions and end positions as a function of the movement of said member along said path.

4,029,044

DEVICE FOR SENSING UNDRIED TIRE CORD FABRIC TREATED WITH A BONDING AGENT

Edward E. Hunter, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio

Filed Sept. 17, 1975, Ser. No. 614,725

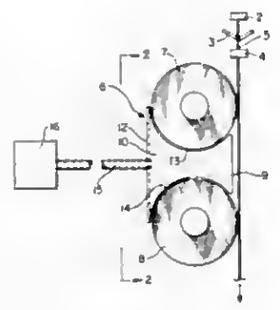
Int. Cl.² B05C *11/04*

U.S. Cl. 118—9 **8 Claims**

1. An apparatus for sensing wetness of supposedly dry fabric treated with a vaporizable solvent carrier and coating agent, comprising:

a. a pair of parallel, elongated idler rolls for contacting a moving, supposedly dry fabric and carrying vapor from the fabric into a chamber in which the vapor accumulates;

aa. means for mounting the idler rolls for contacting the same side of the fabric and for rotating freely about axes which are parallel to the moving fabric and transverse to the direction in which the fabric moves past the idler rolls;



b. means for forming adjacent the fabric a confined chamber, in which vapor from wet fabric can accumulate, the chamber designed to at least partially include the idler rolls; and

c. means for drawing from the chamber, vapor accumulating therein, said means including a conduit for carrying vapor away from the chamber; and

cc. gas analyzer means connected to the conduit for detecting vapor drawn from the chamber.

4,029,045

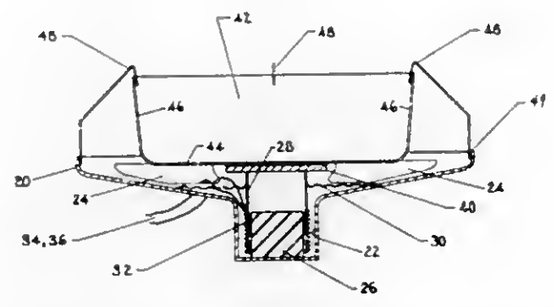
APPARATUS FOR APPLYING COATINGS

Dennis E. Cielaszyk, and Andrew J. Meyer, both of Ann Arbor, Mich., assignors to KMS Fusion, Inc., Ann Arbor, Mich.

Continuation-in-part of Ser. No. 463,858, April 5, 1974, abandoned. This application Mar. 29, 1976, Ser. Nn. 671,294

Int. Cl.² C23C *13/12*

U.S. Cl. 118—49 **2 Claims**



1. An apparatus for coating small particles to be introduced into a coating chamber which comprises:

a. a dish support in said chamber of light material with a weight of 1/15 to 1/30th of an ounce having a support bottom and retaining side walls,

b. means in said chamber to confine said support wherein it may have an unrestrained vertical motion in a direction normal to said support bottom,

c. means in said chamber to vibrate said support in a direction normal to said bottom at a rapid rate comprising a magnetic drive coil of an audio speaker, and

d. control means outside said chamber connected electrically to said drive coil including a frequency oscillator and an amplifier to control the magnitude of the oscillations to cause particles on the support to pulse vertically into the space above said support bottom.

4,029,046

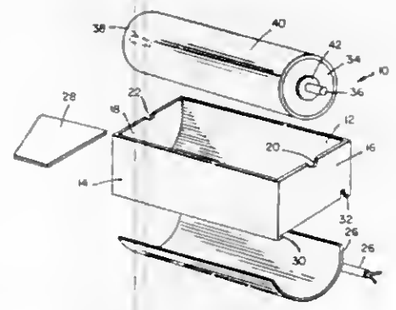
SKI HOT WAX APPLICATOR

Terry J. Hertel, 20065 Northwind Square, Cupertino, Calif. 95014

Continuation of Ser. No. 459,492, April 10, 1974, abandoned. This application Nov. 13, 1975, Ser. No. 631,552

Int. Cl.² B05C *1/02*

U.S. Cl. 118—202 **6 Claims**



1. Apparatus for applying hot wax to the bottom of skis, said apparatus comprising:

an upwardly opening heat conductive tub having a substantially semi-cylindrical configuration and planar end walls and defining a chamber adapted to contain ski wax;

a cylindrical roller having oppositely directed axial struts adapted to engage the respective end walls of the heat conductive tub so that the roller is rotably mounted on said end walls of said tub and the lower portion only of the radial surface of the roller projects into the tub, the radial surface of said roller and the axial struts being constructed of heat conductive material and said roller including heat conducting means connecting the axial struts with said radial surface so that a preselected portion of the heat from the end walls of the tub is conducted through the axial struts to the radial surface of the roller;

a resilient, deformable silicone rubber covering mounted on the radial surface of the cylindrical roller, for picking up wax from said tub and applying it to the bottom of a ski in contact with said covering, said covering being about one-eighth of an inch thick, said dimension being critical in maintaining the proper temperature at the point of contact of said ski with said covering, said covering further having a softness in the range of 30 to 50 durometers inclusive, said softness in combination with said thickness of one-eighth of an inch acting in combination to press wax picked up from said tub into the pores of the bottom surface of said ski as it moves past the point of contact with said covering, said roller being further provided with raised shoulders to prevent said covering from directly contacting said end walls; and

a two-dimensional heater mounted to the exterior surface of the tub and adapted to heat the ski wax in the tub to about 250°–300° F to melt the wax without substantially altering its chemical composition and to heat said covering by conduction of a preselected portion of the heat from the heater through the end walls of the tub, the struts and said heat-conducting means to substantially 200°–225° F to open the pores in the bottom of a ski passing over said covering so the hot wax will be applied to the bottom of the ski uniformly across its entire surface to uniformly fill the pores in the bottom of the ski.

4,029,047

TONER HANDLING SYSTEM

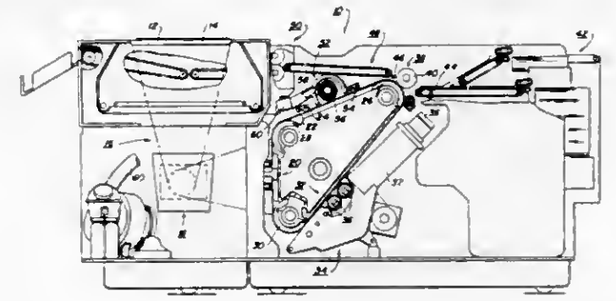
George E. Bell, Ontario, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Oct. 28, 1975, Ser. No. 626,588

Int. Cl.² G03G *15/08*

U.S. Cl. 118—652 **4 Claims**

1. An improved toner handling system having means for developing a latent electrostatic image on a photoreceptor, and means for removing and reclaiming residual toner from the photoreceptor, the reclaiming means including a brush in contact with the photoreceptor and a receptacle into which the residual toner is deposited, wherein the improvement comprises:



means forming a first unfiltered opening in the receptacle, means for conveying toner from the brush to the first unfiltered opening, means forming a second filtered opening in the receptacle, and means for closing the second filtered opening while residual toner is being deposited in the receptacle.

4,029,048

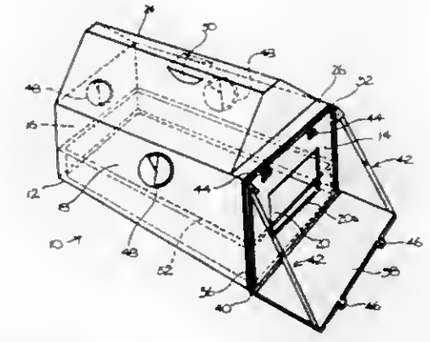
INDOOR-OUTDOOR TOILET FOR SMALL ANIMALS

George Gersbbein, 30 W. 69th St., New York, N.Y. 10023

Filed Aug. 25, 1975, Ser. No. 607,220

Int. Cl.² A01K *1/035*

U.S. Cl. 119—1 **18 Claims**



1. A litter box for animals comprising a generally enclosed housing having a front wall provided with an opening dimensioned to normally permit substantially free passage of an animal therethrough, said housing extending rearwardly of said front wall; waste receiving means disposed within said housing; and mounting means for mounting said housing through a wall of a dwelling to cause said housing to extend outwardly and to dispose the major portion thereof outside the dwelling, while said opening in said housing permits the animal to move between said housing and the dwelling, said housing further including means for ventilating to the outside for permitting air flow through said housing and for permitting odors therein to escape therefrom to the outside of the dwelling.

4,029,049

FISH BARRIER

Albert John Hillier, 1154 Old Baptist Road, North Kingstown, R.I. 02852

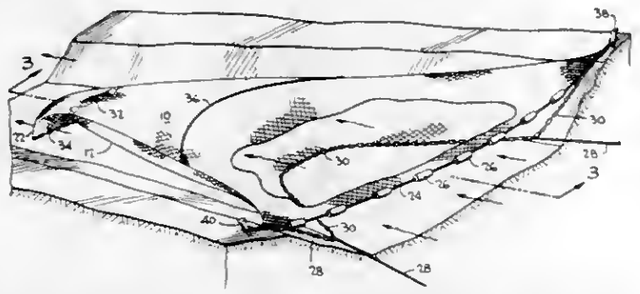
Filed Apr. 29, 1976, Ser. No. 681,733

Int. Cl.² A01K *61/00*; **E02B** *8/08*

U.S. Cl. 119—3 **4 Claims**

1. A fish barrier comprising a generally tapered pocket shaped net adapted to extend across a stream to thereby prevent the passage of fish up said stream, said tapered pocket

shaped net having a large end and a small end, said large end comprising an open mouth having opposed sides and a bottom adapted respectively to contact the sides and bottom of said stream and a top portion adapted to be supported across the surface of said stream, the small end of said net being adapted to be positioned downstream from said mouth and having an



opening formed therein, said opening having an open and closed position, and means releasably holding said opening in its closed position, said opening being adapted to be opened by pressure from trash or debris carried by said stream and to be closed by said means after said trash or debris has passed therethrough.

4,029,050

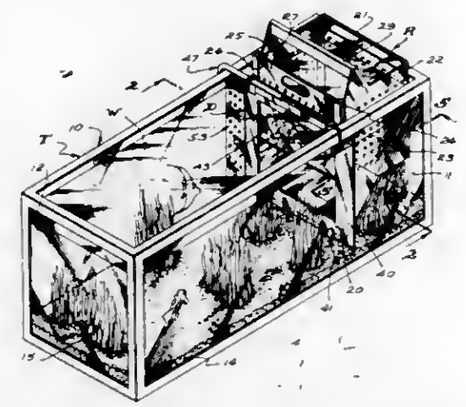
FISH HANDLING APPARATUS

Earl Wilfred Genest, 5716 Geyser Ave., Tarzana, Calif. 91356

Filed Apr. 27, 1976, Ser. No. 680,718

Int. Cl.² A01K *63/02*

U.S. Cl. 119—5 **10 Claims**



1. An apparatus for collecting, segregating and removing fish in aquarium tanks comprising an upwardly opening box-like receiver with flat vertical front, rear and side walls and a bottom wall with a substantially horizontal rear portion and a forwardly and downwardly inclined front portion cooperating to define a fish and plant accommodating recess below the lower rear portion of the receiver, said front portion converging with the front wall and defining a narrow transverse lower tank bottom opposing forward edge, the portion of the side and rear walls occuring above a horizontal plane located a limited predetermined distance above the plane of the rear portion of the bottom wall being perforated, a gateway in the upper portion of the front wall above said horizontal plane, a laterally inwardly and upwardly opening channel about the gateway and a flat vertical perforated gate slidably engaged in the channel and shiftable vertically into and out of closed engagement with the gateway, said receiver being engageable in water in an aquarium tank with its top above the surface of the water in the tank and with its gateway extending below the surface of the water in the tank whereby fish in the tank can be herded through the gateway and into the receiver when the gateway is open and are retained in the receiver when the gateway is closed, the perforated gate and portions of the side and rear walls permitting free circulation of water into and out of the receiver above said horizontal plane therefrom, the portion of the receiver below said horizontal plane defining a sump to retain a predetermined volume of tank water and fish when the receiver is removed from the tank.

4,029,051

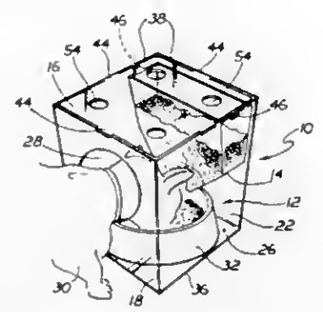
ANIMAL FEEDING AND PROTECTIVE DEVICE

Roy L. McKinney, 3000 Bird Ave., Coconut Grove, Fla. 33133

Continuation-in-part of Ser. No. 443,458, Feb. 19, 1974, abandoned. This application July 14, 1975, Ser. No. 595,908

Int. Cl.² A01K *5/00*

U.S. Cl. 119—52 R **5 Claims**



1. An animal feeding and protective device comprising a transparent housing having a floor, upwardly extending side walls from said floor enclosing a space, a feeding dish for an animal in said space and on said floor, a dispenser for food positioned at least partially within said space and above said feeding dish, food contained in said dispenser and passing by gravity into said dish from said dispenser, an access opening located above said floor and closely adjacent to said feeding dish, said access opening being in one of said side walls and being sufficiently small to allow said animal to bring its head to said feeding dish for feeding purposes, but to prevent the animal from otherwise entering said housing, and the space between said side walls being essentially closed at the top by a removable cover to maintain within said space any odor from food in the food dish and prevent animal access from the top, said side walls being inclined convergingly downwardly at an acute angle, said food dispenser having at least one side inclined at esstentially the same acute angle whereby said food dispenser is matingly supported against one of said inclined side walls and above said feeding dish.

4,029,052

CONVEYING AND WEIGHING SYSTEM

James Mark Launder, 207 Louella, Nokomis, Fla. 33555

Filed Nov. 11, 1975, Ser. No. 631,138

Int. Cl.² A01K *5/02*

U.S. Cl. 119—52 AF **21 Claims**

1. Apparatus for feeding fluent solid material, such as animal feed, comprising:

a conveying line for conveying material in a downstream path of travel;

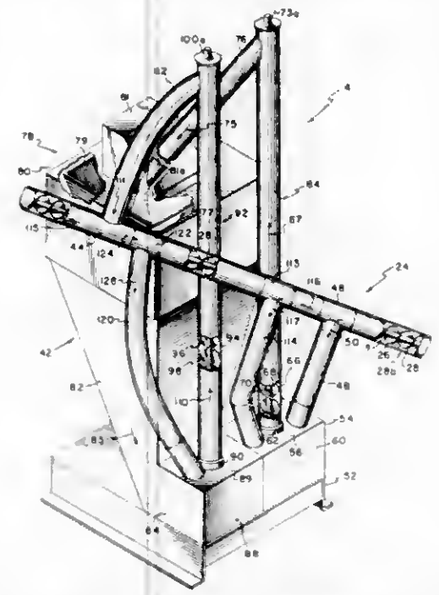
means for weighing the conveyed material;

conveyor bypass means including

a feed supply line connected to an upstream portion of said conveying line and to said weighing means for directing feed from said conveying line to said weighing means; and

a feed discharge line connected to said weighing means and a downstream portion of said conveying line for returning weighed feed from said weighing means to said conveying line for continued movement by said conveying line in said downstream path of travel;

said conveying line including means for passing said material from said upstream portion to said downstream



portion if said conveyor bypass means is inadvertently rendered inoperative.

COOLING BOX FOR METALLURGICAL FURNACE

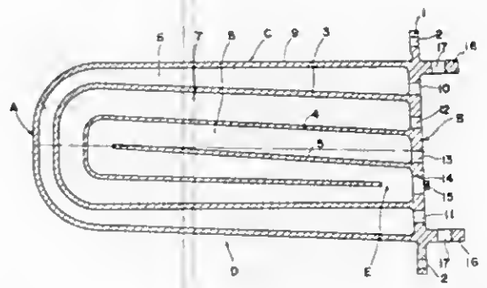
Masaaki Higuchi, Fukuyama, Japan, assignor to Nippon Kokan Kabushiki Kaisha, Tokyo, Japan

Filed Mar. 24, 1976, Ser. No. 670,004

Claims priority, application Japan, Mar. 28, 1975, 50-40876[U]

Int. Cl.² F22B *37/00*

U.S. Cl. 122—6.5 **5 Claims**



1. A cooling box of depressed shape having a front end part (A) for a metallurgical furnace having a plurality of partition walls, a plurality of cooling water channels being defined therein said cooling box comprising a tail flange, a first side plate having an inner side, a first cooling water channel (6), being provided along the inner side of said side plate (9), formed itself into a loop in the front end part (A) of said cooling box and turning back to said tail flange (1), said first cooling channel starting from said tail flange, a second cooling water channel (7), provided along the inner side of said first cooling water channel (6), starting from said tail flange (1), forming itself into a loop at a position near said front end part (A) of said cooling box and turning back to said tail flange (1), and a third cooling water channel (8), provided along the inner side of said second cooling water channel (7), having one end thereof communicating with one end of said second cooling water channel (7), passing around the forward end of one of said partition walls (5) and turning back to said tail flange (1), the width of said first cooling water channel along the front end part of said cooling box being narrowed, whereby cooling water flows smoothly and at high speeds in said cooling channels.

WASTE HEAT BOILER

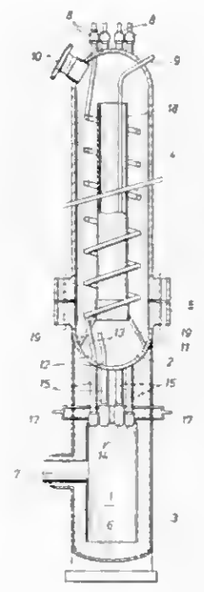
Pieter J. Schuurman, The Hague, Netherlands, assignor to Shell Oil Company, Houston, Tex.

Filed Nov. 12, 1975, Ser. No. 631,246

Claims priority, application Netherlands, Jan. 17, 1975, 7500554

Int. Cl.² F22B *1/18*; **F28F** *13/00*

U.S. Cl. 122—7 R **4 Claims**



1. A heat exchanger comprising, a first cooling chamber and a second gas supply chamber, the first chamber being vertically aligned above the second chamber, the first chamber and second chamber being commonly bounded by a separation plate at the bottom of the first chamber and the top of the second chamber, the second chamber having an inlet for hot gases;

at least one primary coolant supply line disposed in the first chamber, the first chamber also having at least one primary coolant discharge outlet;

lines for discharging hot gases from the second chamber through the separation plate into the first chamber, and

cooling pipes disposed in the first chamber, each of the pipes being in communication at one of their ends with the lines for discharging gases, the other ends of the pipes communicating with outlets for the gases;

cooling jackets surrounding the lines for discharging gases, the cooling jackets contacting the separation plate and the lines in such manner that annular spaces are formed between the lines and the jackets, respectively, and the spaces are in communication with the first chamber through annular openings surrounding each line, but not with the second chamber;

tubular conductive bodies respectively disposed axially around the lines in said spaces, near the entrance of the lines, the conducting bodies containing, respectively, axial annular chambers having outflow openings arranged around the inner circumferences of the conductive bodies;

and a secondary coolant supply line, in communication with the annular chambers of the conducting bodies in such fashion that coolant may flow from the secondary coolant supply line to the annular chambers and thence to the annular spaces.

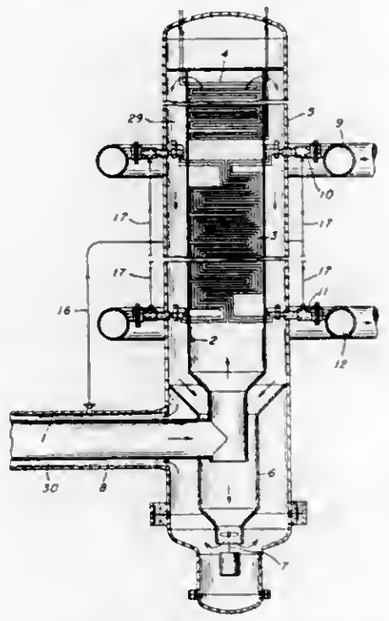
BOILER APPARATUS

Egon Haese, Bochum, Germany, assignor to Dr. C. Otto & Comp. G.m.b.H., Bochum, Germany

Filed Oct. 8, 1975, Ser. No. 620,558
Claims priority, application Germany, Oct. 11, 1974, 2448466
Int. Cl.² F22B 1/02
U.S. Cl. 122—32 4 Claims



1. A boiler including the combination of an outer boiler wall consisting of weldable material, an inner chamber including heat exchanger means spaced inwardly from said outer boiler wall to thereby define an annular flow space for conduecting a gaseous medium at a lowec temperature than the temperature of the gaseous medium fed into said inner chamber, a feed pipe to deliver the gaseous medium into said inner chamber while forming a continuation of said annular flow space, conduit means coupled to said heat exchanger means and extending through openings in said outer boiler wall for supplying and discharging a gaseous medium at temperatures greater than the permissible operating temperature of the weldable material forming the outer boiler wall, each of said conduit means including a tube coupled to said heat exchanger means, said tube extending from said annular flow space through an opening in the outer boiler wall, a sleeve-like jacket welded to said outer boiler wall to project externally of the boiler in a surrounding relation with said tube to thereby define an annular jacket space between the jacket and the tube, and gas-conducting means for feeding a cooling gas along said annular jacket space to pass into said annular flow space without interfering with the process within the boiler.

4,029,056

COMPACT INDIRECT HEATING VAPOR GENERATOR

Leon Jacques Wanson, 118 Avenue Isidore Gheyskens, 1600 Brussels, Belgium

Filed Jan. 16, 1976, Ser. No. 649,675
Int. Cl.² F22B 1/02; F22D 7/12; F22B 27/08
U.S. Cl. 122—34 10 Claims

1. A vapor generating apparatus comprising:

a. heater means comprising a plurality of similarly shaped tube means circulating a heat transfer fluid, arranged in at least one coaxially extending layer, each layer being comprised of a number of successive sets of adjacent coils, the most internal layer defining a fire box having a cylindrical side wall and having first and second ends,

a central burner means adjacent to said first end of the fire box and having at least one inlet for combustion-supporting air,

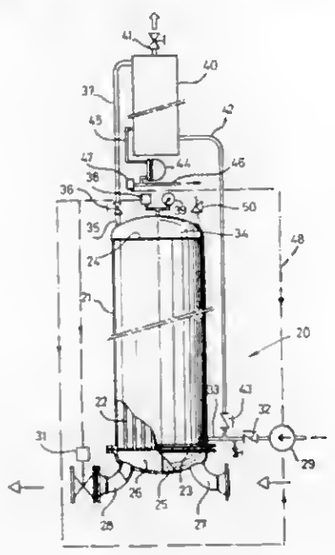
a first end wall for said fire box connected to said side wall at the second end thereof,

an annular chamber means surrounding said tube means and extending lengthwise thereof for circulating said combustion-supporting air to said inlet therefor in heat exchange relationship with the combustion gases thereby to preheat said air prior its intake into the burner means,

exhaust means connected to the fire box for exhausting the combustion gases from the fire box,

discharge means connected to said tube means for the heat transfer fluid, and

b. boiler means comprising heat exchanger means including tank means for the liquid to be evaporated, feed pump means for said liquid, and a bundle of vertically extending



tubes connected to said discharge means for circulating the heat transfer fluid discharged from said heater means, said bundle of tubes lying within said liquid,

separator means having its upper portion connected to the upper portion of said tank means for accepting the liquid/vapor compound discharged from said heat exchanger means and having its lower portion connected to an inlet for the feed liquid, said separator means further having exhaust means for vapor, and

control means responsive to the presence and/or pressure of produced vapor for controlling said feed pump means for the liquid such that dry vapor is continuously exhausted from said separator means without any separation plane between liquid and vapor phases being formed at any time in said heat exchanger means.

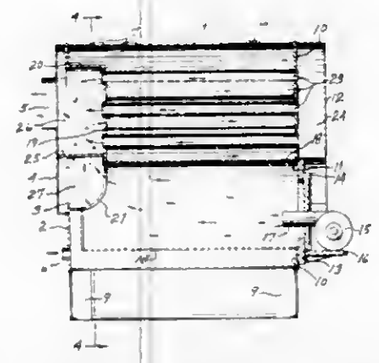
BOILER CONSTRUCTION

Jeannette Frechette nee Bussieres, 1250 15th Street North, Charny, Canada

Filed Nov. 25, 1975, Ser. No. 635,011
Claims priority, application Canada, Mar. 6, 1975, 221390
Int. Cl.² F22B 7/12
U.S. Cl. 122—149 3 Claims

1. A boiler comprising a shell operatively defining a longitudinal direction and including a pair of opposite end wall extending transversely of said longitudinal direction, a pair of partitions extending transversely of said longitudinal direction inwardly of said opposite end walls and confining flue spaces against the inner side of said end walls respectively and an intermediate space between the partitions, an upwardly extending partition dividing one of said flue spaces into a pair of flue chambers laterally juxtaposed transversely of said shell, an elongated firebox longitudinally extending lengthwise of said shell and communicating at one end with one of the laterally juxtaposed flue chambers, a first set of fire tubes

connected between said transverse partitions in communication with said one flue chamber and the other of said flue spaces, a second set of fire tubes connected between said transverse partitions in communication with said other flue space and the other of the flue chambers, said transverse partitions cooperatively forming with said tubes a fluid-tight chamber around the latter inside said shell adapted to be filled with a heated fluid medium, said firebox defining a longitudi-



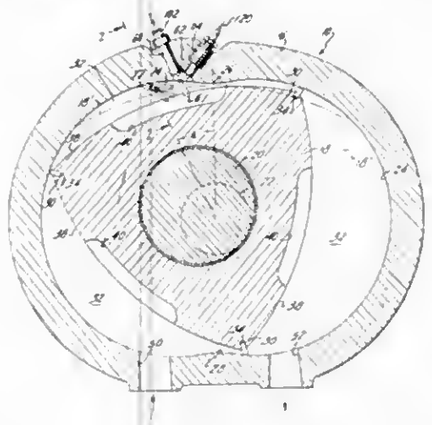
nal axis and said fire tubes being positioned lengthwise of said axis and above the latter, said upwardly dividing partition having a generally V-shaped transverse outline forming a transversely triangular flue chamber constituting said other flue chamber and having an apex downwardly pointing toward the longitudinal axis of the firebox, and the fire tubes of both sets are downwardly spread substantially coextensively in both flue chambers.

4,029,058

STRATIFIED CHARGE ROTARY ENGINE WITH SIDE HOUSING FUEL INJECTION

Charles Jones, Hillsdale, N.J., assignor to Curtiss-Wright Corporation, Wood-Ridge, N.J.

Filed Mar. 15, 1976, Ser. No. 666,792
Int. Cl.² F02B 53/10, 53/12
U.S. Cl. 123—8.09 5 Claims



1. A rotary combustion engine comprising:

a. an outer body having a pair of end walls and an intermediate peripheral wall to define an internal cavity, the inner peripheral surface of said intermediate wall having a multi-lobe profile;

b. an inner body of generally polygonal profile mounted for relative rotation within said outer body, the apex portions of said inner body having sealing cooperation with said multi-lobe peripheral surface to define a plurality of working chambers which vary in volume in response to said relative rotation;

c. a first fuel nozzle mounted on said outer body for discharging fuel into each working chamber after the air therein has been substantially compressed;

d. an igniter mounted on said outer body adjacent to said first fuel nozzle for igniting fuel promptly as it discharges from said first nozzle; and

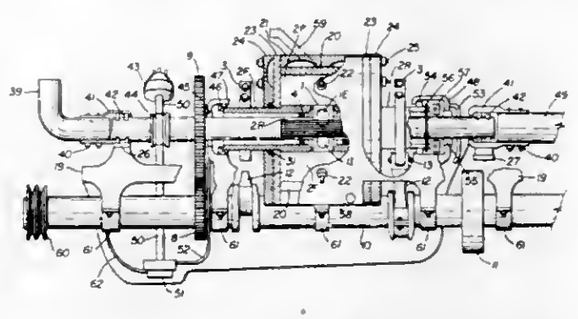
e. a second fuel nozzle mounted on an end wall of said outer body for discharging additional fuel into each working chamber also after the air charge therein has been substantially compressed, said second nozzle having its discharge end disposed close to the multilobe inner peripheral surface of the intermediate wall at a point on its end wall which is spaced from the adjacent lobe junction in a direction opposite to the direction of rotation of the inner body such that the angle subtended about the engine axis by the distance between said second nozzle and the adjacent lobe junction is at least about 15° but is no greater than about 60°, said second nozzle being arranged to discharge its fuel into each working chamber in a direction inclined to the direction of rotation of the inner body so as to discharge generally across and toward the leading end of said chamber with at least a portion of its fuel being discharged in generally the same region as the fuel discharge from the first nozzle so that the ignited fuel discharged by the first nozzle functions as a pilot flame for promptly igniting the fuel as it discharges from the second nozzle.

4,029,059

OSCILLATING PISTON ROTARY MACHINE

Semer H. Coston, 17052 Bernardo Oaks Drive, San Diego, Calif. 92128

Filed Jan. 20, 1975, Ser. No. 542,285
Int. Cl.² F02B 53/00
U.S. Cl. 123—18 R 18 Claims

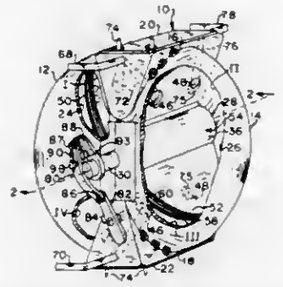


1. A rotary machine of oscillating piston type comprising a hollow shaft, means for mounting said hollow shaft for full circle rotation about its axis, divider means within said shaft to provide separate inlet and outlet passages therein, an enclosing structure disposed about said shaft having continuous chamber defining walls positioned as generatrices about the axis of said hollow shaft, a plurality of independently movable piston elements rotatably disposed on said hollow shaft and interiorally of said chamber walls for effectively dividing the space therebetween into a plurality of separate circumferentially disposed reaction chambers, said hollow shaft further providing separate port openings through the walls thereof at positions adjacent said separate piston elements for cyclical flow communication between said reaction chambers and the inlet and outlet passages of said hollow shaft as the shaft is rotated, and means for regulating the rotational movement patterns of said separate piston elements and said hollow shaft whereby adjacent pistons are oscillated one with respect to the other to effectively change the volumetric displacement of the defined reaction chambers disposed therebetween to provide intake and compression cycles with said piston elements and hollow shaft ports moving cooperatively toward an earlier open flow position when initiating said intake cycle.

4,029,060
OSCILLATING VANE ENGINE

Dan H. Dane, 416 Wake Forest Drive, Wake Village, Tex. 75501

Filed May 21, 1976, Ser. No. 688,851
Int. Cl.² F02B *53/00*
U.S. Cl. 123—18 R **5 Claims**



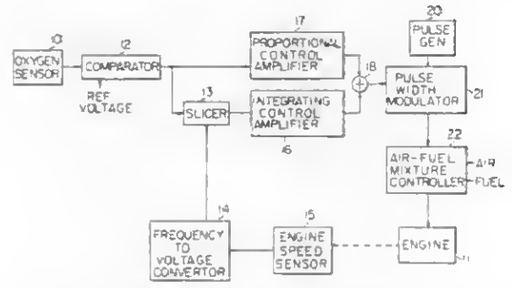
1. An internal combustion engine of the oscillating vane-type comprising:
- a cylindrical casing having end walls and a first shaft extending coaxially through the casing and supported for rotation by said end walls, said first shaft extending outward from at least one of said end walls for connection to a power takeoff assembly;
- a second shaft spaced parallel to said first shaft and rotatably mounted on said casing;
- a pair of vanes affixed to said second shaft within said casing, said vanes being in sealed, sliding engagement with the inside surface of said casing and end walls;
- a pair of blocking members extending inwardly from the inside surface of the casing to said second shaft and dividing the interior of said casing into two compartments, each of said vanes variably dividing a compartment into two compression chambers;
- means for cyclically applying and igniting a fuel mixture in each said compression chamber;
- exhaust means for cyclically removing products of combustion from each said chamber;
- a first crank mounted on said first shaft, and a second crank mounted on said second shaft;
- a link pivotally connecting ends of said cranks; and
- spring biasing means connected between said second crank and said link and responsive to the position of said first crank for receiving a compressive force from said first crank when said vanes approach the end of oscillating travel and to provide a rotational biasing force to said first shaft, whereby torque is provided to said first shaft directly by a said vane during movement of a said vane and from said spring biasing means to said first shaft when said vanes conclude a stroke.

4,029,061
APPARATUS FOR CONTROLLING THE AIR-FUEL MIXTURE RATIO OF INTERNAL COMBUSTION ENGINE

Masaharu Asano, Yokohama, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

Filed Oct. 14, 1975, Ser. No. 622,056
Claims priority, application Japan, Oct. 21, 1974, 49-121166; Oct. 21, 1974, 49-121167; Mar. 18, 1975, 50-31870
Int. Cl.² F02B *3/00*
U.S. Cl. 123—32 EE **7 Claims**

1. Apparatus for controlling the air-fuel mixture ratio of internal combustion engines having means for adjusting the ratio of air to fuel supplied to the engines, comprising:
- means for sensing the composition of the exhaust gases and providing a composition representative signal having one of two discrete values depending upon whether the sensed composition is above or below a predetermined value;
- means for sensing an operating parameter of said engine and providing a parameter representative signal;
- means connected to said composition sensing means and to said parameter sensing means for slicing the amplitude of said composition representative signal as a function of said sensed parameter, the sliced amplitude being proportional to the parameter of the engine;
- an integrating controller connected to said amplitude slicing

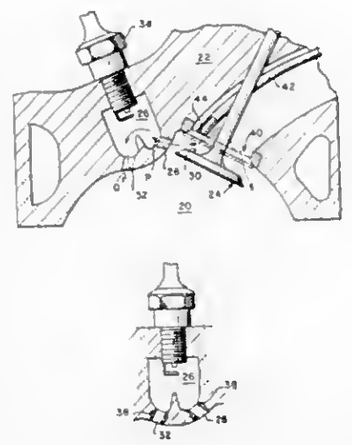


means for integrating the sliced signal to generate a control signal which is continuously variable with respect of time;
- means for generating a series of pulses; and
- means connected to said pulse generating means and to said integrating controller for modulating the duration of said pulses as a function of the value of said control signal, said modulated pulses being connected to said air-fuel ratio adjusting means.

4,029,062
AUXILIARY COMBUSTION CHAMBER FOR INTERNAL COMBUSTION ENGINE

Masaaki Noguchi, Nagoya; Yukiyasu Tanaka, Okazaki; Setsuro Sekiya, and Katsuhiko Motosugi, both of Toyota, all of Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyota, Japan

Filed Nov. 6, 1975, Ser. No. 629,221
Claims priority, application Japan, Nov. 13, 1974, 49-130012
Int. Cl.² F02B *19/10, 19/16*
U.S. Cl. 123—32 ST **2 Claims**

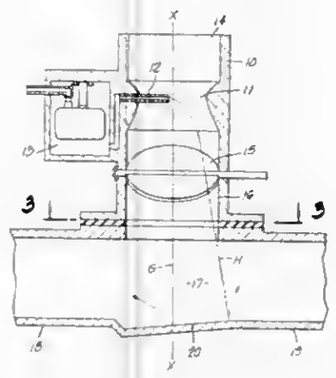


1. In an internal combustion engine having a main combustion chamber defined by a cylinder, a cylinder head and a piston, an auxiliary combustion chamber integrally cast in the wall of the cylinder head having an unvalved inlet port and an unvalved outlet port through the wall of the cylinder head for communicating between the auxiliary combustion chamber and the main combustion chamber, an intake port disposed in the cylinder head for supplying a lean air/fuel mixture into the main combustion chamber, an auxiliary passage disposed in the intake port for supplying a rich air/fuel mixture, an intake valve operably disposed in the intake port for controlling the flow of the air/fuel mixtures, and an ignition spark plug provided in the auxiliary combustion chamber, the improvement comprising:
- tubular insert means of heat and corrosion-resistant material fixed in the wall of the cylinder head within the inlet and outlet ports.

4,029,063
INTAKE APPARATUS FOR INTERNAL COMBUSTION ENGINE

Minoru Tanaka, Chofu, and Sakuji Arai, Wako, both of Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Apr. 16, 1976, Ser. No. 677,670
Claims priority, application Japan, Apr. 24, 1975, 50-49088
Int. Cl.² F02B *75/18*
U.S. Cl. 123—52 M **3 Claims**

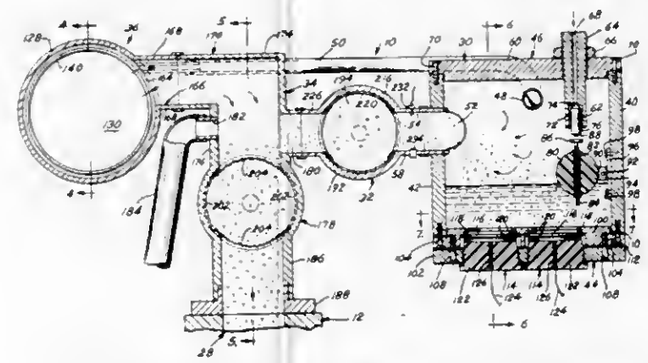


1. Apparatus for delivering an air-fuel mixture to an internal combustion engine having a plurality of cylinders, comprising: a carburetor having a venturi passage with a substantially vertical axis, a fuel nozzle projecting into the venturi passage at right angles to said axis, a distribution chamber receiving an air-fuel mixture generated in said venturi passage, a first branch pipe leading from said distribution chamber in one direction for supplying air-fuel mixture to one of the engine cylinders, a second branch pipe leading from said distribution chamber in the opposite direction for supplying air-fuel mixture to another cylinder of the engine, said distribution chamber having a wall remote from said carburetor against which the air-fuel mixture from the carburetor impinges, said wall being inclined with respect to said axis to equalize fuel concentrations in the air-fuel mixtures delivered to each of said branch pipes.

4,029,064
CARBURETION SYSTEM FOR INTERNAL COMBUSTION ENGINES

Gabor Csaszar, and Gernot Oehley, both of Chicago, Ill., assignors to Irving J. Grace and Geraldine Grace

Filed Mar. 18, 1976, Ser. No. 668,147
Int. Cl.² F02M *27/08;* **B05D** *3/14*
U.S. Cl. 123—119 E **18 Claims**

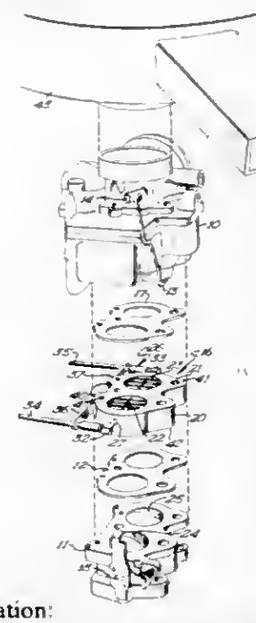


1. A device for carbureting a liquid fuel for combustion in an internal combustion engine, said apparatus comprising, in combustion, a chamber for receiving said liquid fuel, means for ultrasonically vaporizing said fuel in said chamber, a chamber for temporarily storing said vaporized liquid fuel, means for communicating said receiving chamber with said storing chamber and for passing said vaporized liquid fuel from said receiving chamber to said storing chamber, means for monitoring the amount of vaporized fuel passing to said storing chamber from said receiving means, means responsive to said monitoring means for controlling said ultrasonic vaporizing means for vaporizing the said fuel needed by said engine, means for collecting air, means for communicating said air collecting means with said vaporized fuel storing chamber and for mixing said air with said vaporized fuel, means for regulating the amount of mixed air and vaporized fuel for use in said engine for combustion, and outlet means for passing said regulated mixture of air and vaporized fuel to said engine for combustion.

4,029,065
CARBURETOR

Kenneth L. Wood, 4719 4th St. NE., Columbia Heights, Minn. 55424

Filed Oct. 2, 1975, Ser. No. 618,748.
Int. Cl.² F02M *31/00*
U.S. Cl. 123—122 AA **1 Claim**



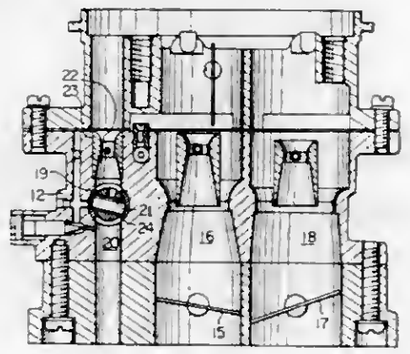
1. In combination:
- A carburetor main body including at least one nozzle discharging a directed jet of fuel;
- a carburetor throttle body including at least one throttle valve for controlling the flow of combustion air past said nozzle;
- a heat exchanger having a conduit for liquid flow and plurality of spaced fins carred by said conduit in heat conducting relation thereto;
- housing means for mounting said heat exchanger between said main body and said throttle body so that fuel discharged by said nozzle flows over and between said fins before reaching said throttle valve;
- and means for connecting said conduit and said heat exchanger for circulation of a fluid therethrough;
- in which said housing means comprises a block of metal aperture to provide passage between said nozzle and said throttle valve, and in which the conduit of said heat exchanger extends transversely across said opening in a first direction, and said fins extend transversely there across in a second direction orthogonal with said first direction, and vary in a first dimension in accordance with their positions along said conduit, to agree with the transverse configuration of said passage means; and
- in which said fins extend beyond said housing means, in the direction of said passage means, towards said nozzle, and terminate somewhat within said housing means, in the direction of said passage means toward said throttle

valve, so that in use said conduit is at a desired position between said nozzle and said throttle.

4,029,066
CARBURETOR

Yoshio Iwasa, Nagareyama, Japan, assignor to Nissan Motor Co., Ltd., Yokohama, Japan

Filed June 24, 1975, Ser. No. 589,904
Claims priority, application Japan, July 9, 1974, 49-77900
Int. Cl.² F02M *13/06*
U.S. Cl. 123—127 **3 Claims**



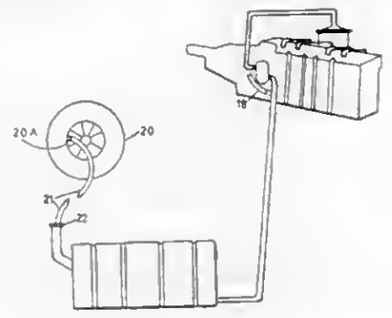
1. An internal combustion engine comprising:
a cylinder head;
a cylinder closed off by said cylinder head;
a piston within said cylinder;
a main combustion chamber formed within said cylinder between said cylinder head and said piston;
an auxiliary combustion chamber;
a torch nozzle establishing communications between said chambers;
a main carburetor communicating only with said main combustion chamber for supplying a relatively lean combustible mixture only to said main combustion chamber;
an auxiliary carburetor communicating only with said auxiliary combustion chamber for supplying a relatively rich combustible mixture only to said auxiliary combustion chamber, said auxiliary carburetor having an induction passage communicating only with said auxiliary combustion chamber and provided with a venturi forming a throat, and a rotary valve rotatably disposed in said induction passage downstream of said venturi with respect to flow of air through said induction passage, said rotary valve having an opening extending therethrough, the cross sectional area of said opening of said rotary valve being smaller than the cross sectional area of said throat of said venturi, whereby there is a reduction of the variation of air quantity induced into the auxiliary combustion chamber through the auxiliary carburetor responsive to the variation of the throttle opening; and
means for igniting the relatively rich combustible mixture in said auxiliary combustion chamber to project a flame through said torch nozzle.

4,029,067
FUEL INDUCTION SYSTEM FOR INTERNAL COMBUSTION ENGINE

Guy Giammattei, 1523 Chapel St., New Haven, Conn. 06511

Filed Mar. 29, 1976, Ser. No. 671,168
Int. Cl.² F02M *59/00*
U.S. Cl. 123—136 **5 Claims**

1. A fuel induction system for feeding fuel to an internal combustion engine comprising:
a fuel tank operatively connected to said engine,
means for pressurizing said fuel tank to provide a positive pressure therein for feeding fuel to said engine,

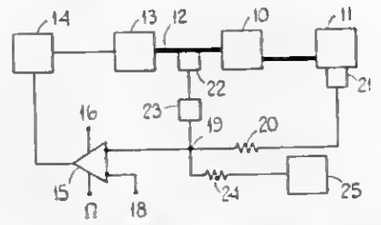


said means for pressurizing said fuel tank comprising a source of compressed air,
wherein said source comprises an inflated tire.

4,029,068
FUEL SYSTEMS FOR INTERNAL COMBUSTION ENGINES

Christopher Robin Jones, Alcester; Malcolm Williams, Solihull, and Authony John Adey, Gravesend, all of England, assignors to Cav Limited, Birmingham, England

Filed Feb. 13, 1976, Ser. No. 658,125
Claims priority, application United Kingdom, Feb. 25, 1975, 7753/75
Int. Cl.² F02M *39/00*
U.S. Cl. 123—139 E **5 Claims**



1. A control system for the fuel supply system of an internal combustion engine, the fuel supply system comprising a fuel pump for delivering fuel to the engine and control means movable to adjust the quantity of fuel supplied by the pump, the control system including an electrical device operable to control the setting of said control means and an electronic control circuit for providing a control signal to said device, the electronic control circuit including an operational amplifier the output of which is utilized to determine the signal applied to said electrical device, engine speed sensing means for providing a first signal to a summing junction connected to an input of the amplifier, second means providing a second signal which is representative of the setting of said control means, third means for providing a third signal to said summing junction representative of demanded speed, and circuit means interposed between said second means and the summing junction for adjusting the amplitude of the second signal, and for ensuring that a derivative of said second signal is always supplied to said summing junction, said circuit means defining two paths, the first of which is resistive and the second of which includes a capacitor so that only the derivative of the second signal passes along said second path to the summing junction, said first path including a variable element operable to adjust the amplitude of the second signal passing along the first path to the summing junction, and including a variable element operable to determine the amplitude of the derivative of the second signal passing along the second path to the summing junction, said variable elements being resistors defined by a potentiometer, the opposite ends of the resistance element of which are connected to points in said paths respectively, said potentiometer having a slider connected to an earthing point and to the other input terminal of the amplifier.

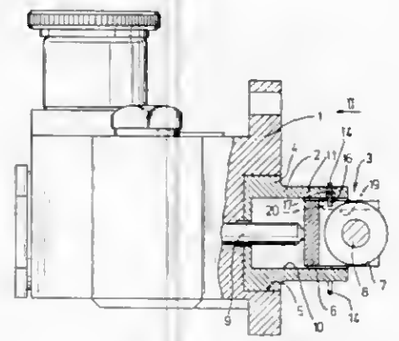
FUEL SUPPLY PUMP

Walter Häfele, Fellbach, and Rudolf Kleeberger, Munich, both of Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany

Filed Aug. 27, 1975, Ser. No. 608,247
Claims priority, application Germany, Sept. 4, 1974, 2442261; July 12, 1975, 2531188
Int. Cl.² F02M *39/00*
U.S. Cl. 123—139 R **13 Claims**

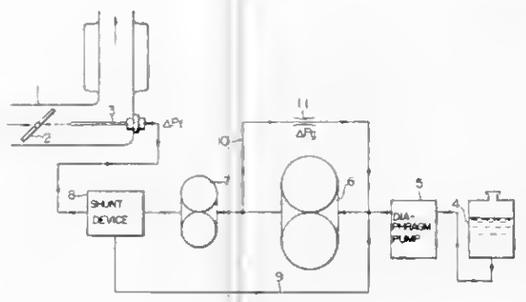


1. A fuel supply pump for the pre-supply of fuel to the fuel injection pump of an internal combustion engine, said fuel supply pump including a housing and an externally actuated axially movable roller shaft, said roller shaft having a substantially rectangular cross section and flat external surfaces, said fuel pump further including releasable means for holding and securing said roller shaft to prevent unintentional release thereof, the improvement comprising:
A. a guide bushing, fixedly attached to said housing and capable of receiving and axially guiding said roller shaft; and
B. said releasable means including stop means, extending into said guide bushing and capable of engaging a recess in said roller shaft, thereby limiting the axial motion thereof.

4,029,070
FUEL SUPPLY SYSTEM FOR INTERNAL COMBUSTION ENGINE

Akira Kobayashi, Nagoya, Japan, assignor to Kabushiki Kaisha Toyota Chuo Kenkyusho, Nagoya, Japan

Filed Aug. 6, 1975, Ser. No. 602,314
Claims priorlty, application Japan, Aug. 7, 1974, 49-90606
Int. Cl.² F02M *39/00*
U.S. Cl. 123—139 AN **5 Claims**

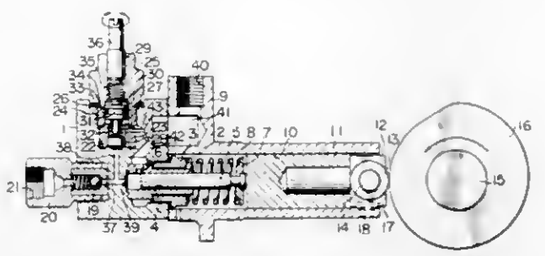


1. In an internal combustion engine of the type in which the air is supplied substantially in proportion to the engine speed and the opening degree of a throttle valve and the fuel to be mixed with said air is injected through a fuel injection nozzle, a fuel supply system comprising
a. pump means which discharges the fuel in proportion to the engine speed, said pump means including:
a gear type governor pump driven at a speed in proportion to the speed of the engine, a gear type fuel injection pump the suction port of which is hydraulically connected to the discharge port of said governor pump, which is driven at a speed in proportion to the speed of said engine, and which has the discharge rate half as much as that of said governor pump, and
a recirculation line hydraulically interconnecting between the suction and discharge ports of said governor pump and having therein disposed a governor nozzle the diameter of the nozzle hole of which is equal to that of said fuel injection nozzle; and
b. a fuel shunt device for supplying a part of the fuel supplied from said pump means to said fuel injection nozzle while recirculating the remaining fuel to said pump means, said fuel shunt device having
first valve means for automatically controlling the area of the opening of a passage hydraulically connecting said fuel shunt device to said fuel injection nozzle in proportion to the discharge rate of said pump means, and second valve means for automatically controlling the area of the opening of a return line hydraulically connecting said fuel shunt device to said pump means in inverse proportion to the opening degree of said throttle valve,
whereby the air-fuel mixture with a substantially constant air-fuel ratio independently of the speed and load of the engine may be charged into said engine.

4,029,071
FUEL INJECTION PUMP FOR DIESEL ENGINES

Atsushi Saito, Nagahama, and Minoru Shimada, Kohoku, both of Japan, assignors to Yanmar Diesel Engine Co., Ltd., Osaka, Japan

Filed June 18, 1975, Ser. No. 587,859
Claims priority, application Japan, Apr. 14, 1975, 50-44994
Int. Cl.² F02M *39/00*
U.S. Cl. 123—139 AS **2 Claims**



1. In a fuel injection pump for Diesel engines comprising plunger means installed in the pump body, a delivery valve, and injection-quantity control means provided in the pump body between the plunger means and delivery valve, said control means having a piston slidably disposed in the pump body, with the space adjacent to one end thereof communicated with the plunger means and delivery valve, the improvement wherein said injection-quantity control means further comprises a regulator spindle means for displacing said piston in direct response to the speed of rotation of the engine, said regulator spindle engaging a regulator piece disposed between said spindle and the other end of said piston in coaxial relationship therewith, said regulator piece being axially adjustable by said regulator spindle to press the piston against the pump body through the agency of a spring located on the other end of the piston, the maximum volume displaced by the piston being determined by the injection-quantity control means and being preset to a range not less than the volume injected initially at the engine start.

4,029,072

IGNITING APPARATUS FOR INTERNAL COMBUSTION ENGINES

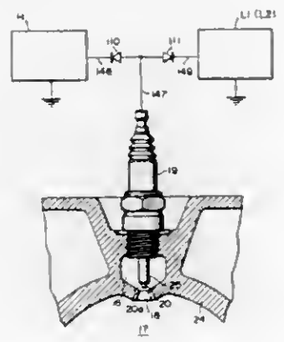
Kenji Goto, and Daisaku Sawada, both of Shizuoka, Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyota, Japan

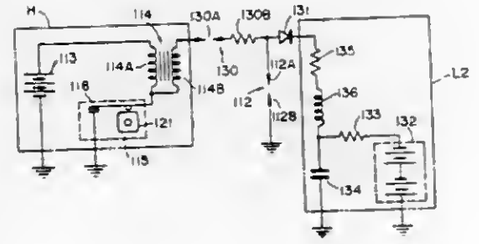
Filed July 9, 1974, Ser. No. 487,212

Claims priority, application Japan, Aug. 27, 1973, 48-96016; Nov. 6, 1973, 48-124640

Int. Cl.² F02B *23/00*; **F02P** *23/00*

U.S. Cl. 123—191 S **6 Claims**





1. An ignition apparatus for internal combustion engines comprising:

a main combustion chamber connected to receive a lean fuel mixture;

an auxiliary combustion chamber dimensioned to receive a lean mixture from said main combustion chamber;

a communicating opening for inter-connecting said auxiliary and main combustion chambers wtih each other;

a spark generating means located close to and forming a spark gap at said communicating opening; and

an igniting electric source means for generating an electric discharge spark in the spark gap to ignite the lean mixture within said auxiliary combustion chamber and to supply energy to the combustion gas when said combustion gas is passing through said communicating opening;

said igniting electric source means including a high voltage electric source device comprising an electric source, an ignition coil connected to said electric source and a contact breaker connected in series to a primary winding of said ignition coil to feed an initial high voltage surge to said spark gap, and a low voltage electric source device comprising a second electric source, a capacitor connected to said second electric source through a first resistor forming a charging path and a second resistor connected to said capacitor to form a discharging path and to determine a discharging time constant, said capacitor having a capacity of a value sufficient to maintain the electric discharge generated in said spark gap by said high voltage electric source device until the time when the combustion gas generated within said auxiliary combustion chamber passes through said communicating opening, these said electric source devices being connected to said spark gap in parallel to each other through reverse current breakers respectively for preventing a current leakage occurring between both said electric source devices.

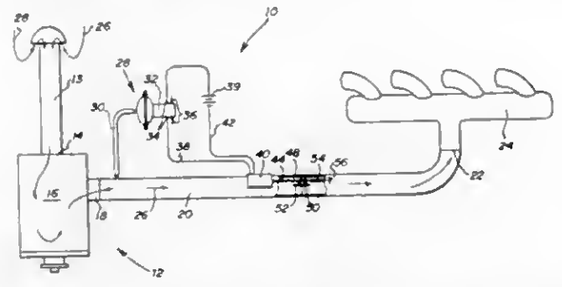
AUTOMATIC MOTOR KILL SYSTEM FOR PREVENTING DAMAGE TO A HEAVY EQUIPMENT MOTOR DUE TO A DIRTY AIR FILTER

James Dey, 1101 Woodlark, Tyler, Tex. 75701

Filed July 14, 1975, Ser. No. 595,804

Int. Cl.² F02B *77/00*

U.S. Cl. 123—198 D **8 Claims**



1. A dirty air cleaner responsive engine shut off system for use with an internal combustion engine in a heavy construction vehicle having an air cleaning system connected by a connection pipe to the intake manifold of the engine comprising:

means for sensing a pressure decrease including a normally open vacuum switch connected in an air tight manner to the connection pipe in a region near the air cleaning system and responsive to the pressure level within the air cleaning connection pipe, said vacuum switch operable to close in response to a decrease in the pressure level to a predetermined level which occurs when the air cleaning system becomes obstructed to the point that damage could occur to the engine, and

means responsive to closing of said switch for automatically completely shutting off the engine before damage occurs to the engine due to the obstruction of the air cleaning system.

4,029,074

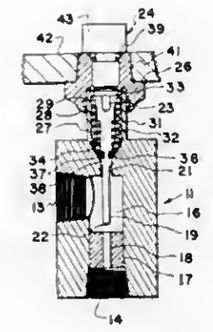
FUEL VALVES

Boyd Paul Sliger, Concord, Tenn., assignor to Robertshaw Controls Company, Richmond, Va.

Filed Dec. 4, 1975, Ser. No. 637,497

Int. Cl.² F02B *77/08*

U.S. Cl. 123—198 D **2 Claims**



1. In an internal combustion engine including means for supplying fuel to said engine in a fuel line and means for circulating a liquid coolant through said engine including a radiator and fan to dissipate the heat of combustion from said engine up to a rated torque output of said engine, a temperature responsive fuel supply valve comprising:

a valve body having an inlet and an outlet connected in said fuel line, said inlet being transverse to said outlet;

means in said valve forming an orifice in said outlet, said orifice providing a maximum metered flow of fuel through said valve at the rated torque output of said engine;

a movable plug of smaller diameter than said orifice supported within said valve body and adapted for insertion into said orifice, the end of said movable plug received in said orifice being configured so as to maintain a linear relationship between the movement of said plug into said orifice and the resulting rate of fuel flow through said orifice;

spring means for holding said movable plug clear of said orifice; and

thermal power means including a displaceable stem operatively connected to said plug and responsive to said temperature of said coolant for inserting said plug into said orifice thereby linearly reducing the flow of fuel through said orifice to vary the maximum torque output of said engine thereby reducing the radiator fan speed.

COMBUSTION APPARATUS FOR AN INTERNAL COMBUSTION ENGINE

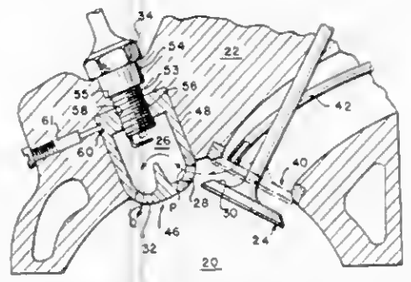
Masaaki Noguchi, Nagoya; Yukiyasu Tanaka, Okazaki; Setsuro Sekiya, and Katsuhiko Motosugi, both of Toyota, all of Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyota, Japan

Filed Nov. 6, 1975, Ser. No. 629,227

Claims priority, application Japan, Nov. 13, 1974, 49-130009; Nov. 13, 1974, 49-130010

Int. Cl.² F02B *19/10*

U.S. Cl. 123—75 B **12 Claims**



1. Combustion apparatus for an internal combustion engine comprising:

a main combustion chamber, including a cylinder head;

an auxiliary combustion chamber including a cavity in said cylinder head having an opening into said main combustion chamber;

an aperture in said cylinder head interconnecting with said cavity;

an auxiliary combustion chamber shell fitted into said cavity from the main combustion chamber through said opening, said shell including a threaded aperture; and

a spark plug inserted through said aperture in said cylinder head and threaded into said aperture in said shell, said spark plug threadedly retaining said shell in said cavity.

FIREPLACE OPENING ENCLOSURE

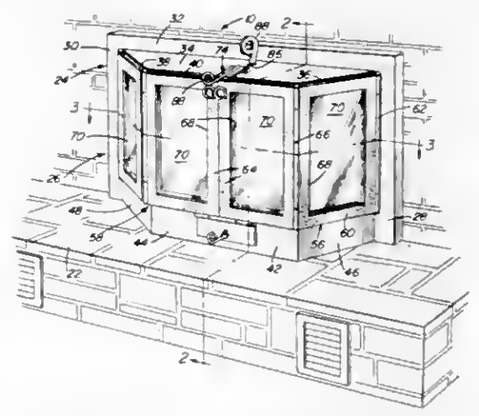
Jack F. Simington, Box 141, Star Route, Chiloquin, Oreg. 97624

Filed Nov. 17, 1975, Ser. No. 632,799

Int. Cl.² F24C *15/04*

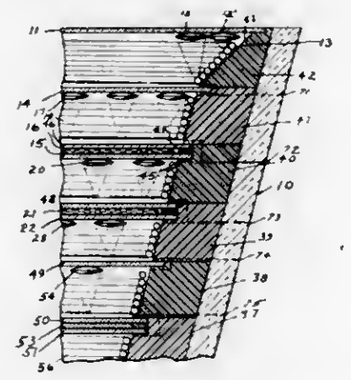
U.S. Cl. 126—140 **6 Claims**

1. In combination with a fireplace opening including opposite side walls, a top wall and a lower hearth extending outwardly beyond said opening, an enclosure for said opening, said enclosure comprising a downwardly opening frame including a pair of upstanding opposite side members extending along the outer faces of said side walls and an upper horizontal member extending and connected between the upper ends of said upstanding members, said upper member extending along and conforming to the general contour of the front face of said top wall extending between the upper ends of said side walls, an elongated horizontal top panel extending along and supported from the lower marginal portion of said horizontal member and projecting outwardly of the latter, the opposite and edge portions of said top panel being angled outwardly toward the remote ends thereof, said top panel including an outer marginal edge extending between the outer ends of said end edge portions generally paralleling the front face of said top wall, a lower partial front wall closely overlying said hearth, spaced below said top wall and including a central portion generally paralleling said outer marginal edge and angled opposite end sections spaced below and generally paralleling said end edge portions with the remote ends of said angled end sections anchored to the lower ends of said side members, a pair of door assemblies, each door assembly comprising first and second door sections pivotally joined together along adjacent upstanding edges thereof, the upstanding edge of each first door section remote from the corresponding second door section being hinged from a corresponding side member of said frame and each door assembly being swingable into and out of position with its first door section closing that portion of the spacing between the adjacent angled end



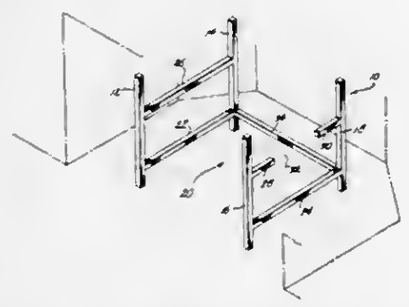
edge of said top wall and the corresponding lower front wall end section and its second door section bridging the adjacent ends of said top panel outer marginal edge and said lower partial front wall central portion, said door sections having openings formed therethrough closed by means of heat resistant transparent panels, the ends of upper marginal portions of the second door sections remote from the corresponding first door sections and said top panel including coacting latch means operative to releasably retain said door assemblies in the closed positions thereof, said lower partial front wall including a draft opening formed therethrough, said top panel outer marginal edge and said lower front wall central portion being substantially straight throughout their horizontal extent and the upstanding edges of said second door sections remote from the corresponding first door sections are disposed in at least close juxtaposition said door assemblies are in their closed positions, said coacting latch means including a single latch element shiftably supported from said top panel and simultaneously engageable with said second door sections, said single latch element and the upper marginal portions of said second door sections including coacting cam surfaces functioning to draw the upstanding edges of said second door sections toward each other as a result of said latch means being actuated to retain said door assemblies in the closed positions thereof.

4,029,077
SOLAR ENERGY COLLECTOR
Jerry Gorniak, 2317 E. 43rd St., Erie, Pa. 16510
Filed June 13, 1975, Ser. No. 577,259
Int. Cl.² F24J 3/02
U.S. Cl. 126—271 12 Claims



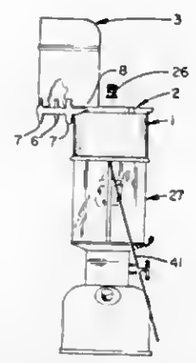
1. A solar collector comprising a fluid path for a liquid having a plurality of turns disposed generally in a hollow pyramidial body,
- a plurality of first lenses,
- a first sheet means supporting said lenses,
- said first lenses having spaced from them a first fluid path for liquid,
- said first fluid path for liquid being disposed a distance substantially equal to the focal length of said first lenses,
- means to conduct said liquid from said fluid path to a heat battery,
- said fluid path comprising a first coil of tubing,
- a second sheet of rigid material disposed generally parallel to said first sheet,
- and a third sheet of rigid material spaced from said second sheet generally parallel to said first sheet of material supporting a sheet of water,
- a plurality of second lenses fixed to said second sheet of material to the underside thereof,
- said second lenses being spaced from said sheet of water a distance substantially equal to the focal length of said second lenses.

4,029,078
ANDIRON FOR CONTROLLED BURNING OF LOGS
Robert E. Eller, 234 SW. 129th, Seattle, Wash. 98188
Filed Aug. 30, 1976, Ser. No. 718,944
Int. Cl.² F24B 13/00
U.S. Cl. 126—298 8 Claims



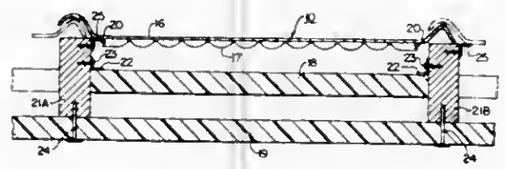
1. An andiron supportable on a fireplace floor, comprising four corner posts spaced apart to define a combustion space between them;
- a first continuous lower log support bar extending between, and connected at its ends to, a first front corner post and a first rear corner post located behind it;
- a second continuous lower log support bar extending between, and connected at its ends to, a second front corner post and a second rear corner post located behind it;
- said first and second lower log support bars together constituting a lower support means for supporting a plurality of logs in a generally horizontal position spaced above the fireplace floor;
- a continuous upper log support bar extending between, and connected at its ends to, the first front corner post and the first rear corner post, above the said first continuous lower log support bar;
- an open centered upper log support bar means spaced above the second continuous lower log support bar, comprising a pair of log support bar sections connected to the said second front corner post and said second rear corner post, and projecting inwardly from said posts in cantilever fashion towards each other, with a substantial open space existing between their free ends;
- said log support bar sections and said continuous upper log support bar constituting a support for a plurality of upper level logs, serving to support such logs in a generally horizontal position spaced above the lower level of logs, and said open space between said two upper bar sections being sized to permit at least one log to be placed diagonally with one end thereof supported on the center portion of the upper continuous log support bar and the opposite end thereof supported on a lower level log within the region of said open space, so that such sloping log will more easily burn at the start of combustion and will promote the generation of a larger flame which will better ignite the upper level logs; and
- means interconnecting the two rear corner posts, so that said andiron is a unitary structure.

4,029,079
LANTERN STOVE DEVICE ATTACHMENT
Joseph F. Elder, 1040 Bristol Circle, Garland, Tex. 75041
Filed Oct. 15, 1975, Ser. No. 622,683
Int. Cl.² F24C 5/04
U.S. Cl. 126—258 6 Claims



1. A stove device attachment for lanterns including a skirt, a grate, and a shield in which the skirt is adapted to fit over and around the draft hood of a conventional lantern of the combustion-type, the grate is adapted to removeably pressure fit within and be supported on the top of the skirt and to be removeably secured to the lantern by means of the lantern central connection and the draft hood connection nut of the lantern, and the shield is adapted to removeably pressure fit within structure on the back of the grate, in which the means for pressure fitting the grate within the top of the skirt includes crimping in the top of the skirt and recessed surfaces on the bottom of the grate to form a pressure interface with the crimped surface and other portions of the inner circumference of the top of the skirt, the means for supporting the grate on top of the skirt includes projections above the recessed surfaces and around the back of the grate, the means for securing the grate to the lantern includes structure defining a hole in the grate so that the hole in the grate is adapted to fit over the central connection of a conventional lantern, and the structural means for pressure fitting the shield on the back of the grate includes staggered tiers of prongs extending at right angles above and below the surface of the back of the grate.

4,029,080
THERMAL COLLECTOR OF SOLAR ENERGY ADAPTED FOR HIGH TEMPERATURE OPERATION
Roger W. Warren, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.
Filed Jan. 27, 1975, Ser. No. 544,605
Int. Cl.² F24J 3/02
U.S. Cl. 126—270 15 Claims

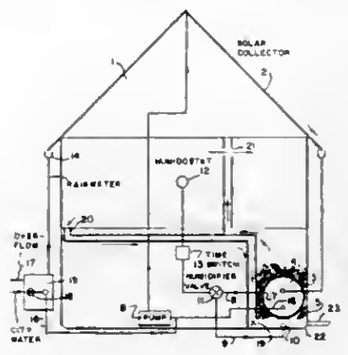


1. A thermal collector of solar energy adapted for high temperature operation, comprising,
- a relatively thin thermally conductive backing having relatively low thermal inertia and being disposed for transferring collected heat to an external coolant,
- a translucent and relatively stiff window to transmit solar radiation,
- an energy-absorbing material carried by said backing to absorb energy of solar radiation and transfer the heat of such absorbed energy to said backing,
- first means for supporting said window relative to said backing generally about the window periphery to expose said energy-absorbing material to solar radiation that is transmitted by said window, means for sealing an evacuated space between said window and said backing, and second means for supporting said window relative to said backing over at least one area within the window periphery so as to strengthen said thin backing against pressure differentials resulting from evacuation while limiting leakage of absorbed heat to said window to a relatively low value.

4,029,081
SOLAR ENERGY TRANSPORT SYSTEM
John D. Strong, 136 Gray St., Amherst, Mass. 01002
Filed Nov. 14, 1975, Ser. No. 631,877
Int. Cl.² F24J 3/02
U.S. Cl. 126—270 12 Claims

1. A solar energy collector comprising
- a heat conducting sheet having surface for exposure to the sun
- an enclosed air space abutting said sheet,
- a system of liquid-receiving, open-top troughs in said air space in thermal contact with said sheet,
- liquid supply means for delivering liquid to said troughs and drain means for receiving any liquid overflowing said troughs,
- inlet and outlet air conduits communicating with said air space, and
- means for causing a flow of air through said air space;
- whereby the heat of vaporization of the quantity of liquid vaporized is transferred from said sheet to said outlet air conduit in addition to the heat transferred by the temperature rises of the air and the vapor.

4,029,082
HEAT AND COLD STORAGE APPARATUS
Harry E. Thomason, and Harry Jack Lee Thomason, Jr., both of 609 Cedar Ave. (Fort Washington, Md.), Washington, D.C. 20022
Filed June 19, 1974, Ser. No. 480,752
Int. Cl.² F24J 3/02
U.S. Cl. 126—271 10 Claims

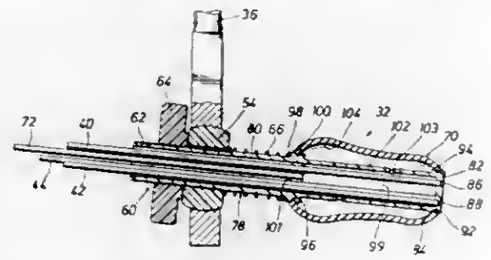


1. Apparatus for storing heat, recovering heat from storage and humidifying air for home or other space heating needs comprising, a storage bin having heat storage material therein, means to channel air in sequence as follows; from a space to be warmed to enter and flow through said storage bin to pick up heat from storage at low temperature to warm the air and return the warm air to the space to be warmed; water supply means to introduce water to dampen said heat storage material and add moisture to the low temperature air, said water, upon vaporizing and adding moisture, extracting heat from said storage material at low temperature and transferring said low temperature heat and moisture to the space to be warmed, said water supply means being within the bin and acting as further heat storage material.

4,029,083
PROBE FOR AUDIOMETRIC APPARATUS
Carl S. Baylor, P.O. Box 567, Livingston, Tex. 77351
Filed May 12, 1975, Ser. No. 576,249
Int. Cl.² A61B 10/00
U.S. Cl. 128—2 Z 4 Claims

1. A probe for penetrating an auditory canal of a patient, said probe comprising:
- sleeve means for carrying a plurality of smaller diameter conduit means, said sleeve means extending along substantially an entire length of said probe;
- disposable inflatable bladder means carried by said sleeve means for circumferentially expanding when pressurized fluid is introduced into said bladder means to provide a closed chamber within the auditory canal of the patient, said bladder means being removably attached to said sleeve means;
- said sleeve means comprising groove means circumferen-

tially extending around an outside surface of said sleeve means, and said inflatable bladder means comprising flange means circumferentially extending around an inside surface of said inflatable bladder means, said groove means being cooperable with said flange means to provide a substantially fluid tight seal therebetween;



said groove means further comprising a first groove positioned around a circumference of a perforated disc, said perforated disc being arranged to provide a support for said smaller diameter conduit means, and a second groove displaced from said first groove.

4,029,084

ULTRASOUND APPLICATOR WITH GUIDE SLOT FOR PUNCTURING CANNULA

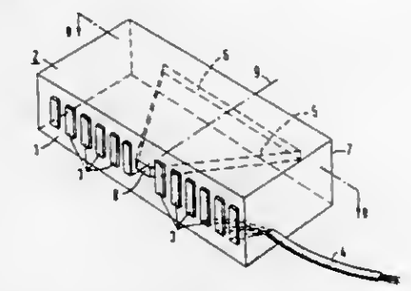
Richard Soldner, Erlangen, Germany, assignor to Siemens Aktiengesellschaft, Berlin & Muoich, Germany

Filed Dec. 9, 1975, Ser. No. 639,170

Claims priority, application Germany, Dec. 23, 1974, 7442924[U]

Int. Cl.² A61B *10/00*

U.S. Cl. 128—2 V **12 Claims**



1. In an ultrasound applicator for ultrasonic-echo planigraphic imaging apparatus, said applicator including a carrier portion having an application surface adapted to be located on the body surface of a patent; and a plurality of ultrasound transducer elements mounted on said application surface in at least one row, the improvement comprising: said carrier portion including a guide slot for a puncturing cannula extending across said row of transducer elements in the longitudinal direction thereof, said guide slot reducing from a predetermined maximum slot length at the surface of said carrier portion opposite to said application surface to a minimum slot length at said application surface, said guide slot terminating in the application surface of said carrier portion in the center of said row of transducer elements, said row of transducer elements having a void of at least one transducer element at the location where said guide slot terminates in said application surface said transducer elements each having a maximum width of about 1.3 mm, a spacing of about 0.2 mm maximum between the individual transducer elements of a row of transducer elements and a slot length of about 2 mm at the application surface, and said row of transducer elements having a center void of a total of two transducer elements.

4,029,085

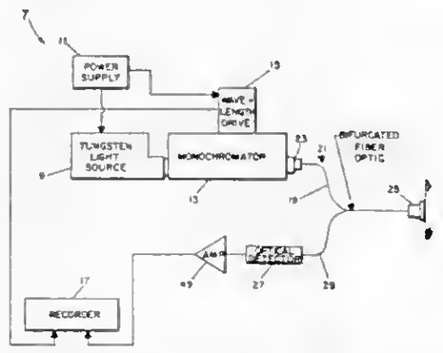
METHOD FOR DETERMINING BILIRUBIN CONCENTRATION FROM SKIN REFLECTANCE

David P. DeWitt; Robert E. Hannemann, both of West Lafayette, Ind., and John F. Wiechel, Houston, Tex., assignors to Purdue Research Foundation, West Lafayette, Ind.

Filed Mar. 26, 1976, Ser. No. 670,838

Int. Cl.² A61B *5/00*

U.S. Cl. 128—2 R **13 Claims**



1. A method for detecting jaundice in a patient, said method comprising:

measuring the spectral reflectance of the skin of a patient; and

determining from said measured reflectance the bilirubin concentration in the blood of said patient.

4,029,086

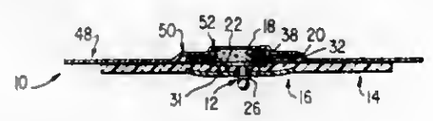
ELECTRODE ARRANGEMENT

Eugene R. Corasanti, New Hartford, N.Y., assignor to Consolidated Medical Equipment, Inc., Utica, N.Y.

Filed Aug. 11, 1975, Ser. No. 603,505

Int. Cl.² A61B *5/04*

U.S. Cl. 128—2.06 E **11 Claims**



1. An electrode arrangement for making an electrical contact with the skin of the body of a patient comprising, in combination:

an electrode element including a base flange with upper and lower surfaces and a central post upstanding from said upper surface, said electrode element being conductive;

a flexible adhesive pad for adhering to the body, said adhesive pad including a foam pad member having upper and lower surfaces and an adhesive layer provided on, and coextensive with, said lower surface of said foam pad member, said adhesive pad having a central aperture received by said central post, said central post extending through said central aperture such that a portion of said central post extends above said upper surface of said adhesive pad, said upper surface of said base flange disposed adjacent to, and adhering to, said adhesive layer, said adhesive pad extending beyond the periphery of said base flange

a flexible, foam, O-ring-shaped member adhering to said adhesive layer of said adhesive pad such that said O-ring-shaped member circumscribes said base flange of said electrode element; and

a shielding means comprising a dome-shaped annular washer, comprised of a tough, rigid material, received by said central post adjacent said upper surface of said adhesive pad, said shielding means for shielding said base flange from forces to which said electrode arrangement

can be exposed, said annular washer having an outside diameter generally equivalent to the outside diameter of said O-ring-shaped member for deflecting the forces away from said base flange to said O-ring-shaped member without decreasing the flexibility and the ability of said adhesive pad to conform to the body of a patient.

4,029,087

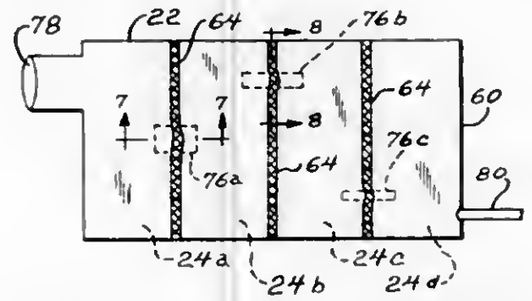
EXTREMITY COMPRESSION DEVICE

John F. Dye, Reedsburg, Wis., and Charles R. Memhardt, Morton Grove, Ill., assignors to The Kendall Company, Boston, Mass.

Filed Oct. 28, 1975, Ser. No. 625,967

Int. Cl.² A61H *1/00*

U.S. Cl. 128—24 R **27 Claims**



1. A device for applying compressive pressures against a patient's limb from a source of pressurized fluid comprising:

an elongated pressure sleeve for enclosing a length of the patient's limb, said sleeve having a plurality of separate fluid pressure chambers progressively arranged longitudinally along the sleeve from a lower portion of the limb to an upper portion of the limb proximal the patient's heart relative said lower portion;

means for filling said chambers from said source during periodic compression cycles while applying a greater pressure in each inflated lower chamber than the pressure in any upper inflated chamber to apply a compressive pressure gradient against the patient's limb by the sleeve which progressively decreases from said lower to upper limb portions throughout the compression cycles, said filling means including means for connecting the source to a lower first chamber in said sleeve;

means for distributing fluid from said first chamber to progressively located upper chambers at progressively decreasing pressures; and

means for emptying said chambers during periodic decompression cycles between said compression cycles.

4,029,088

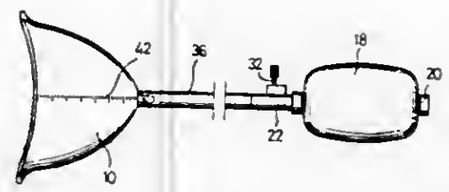
BIOLOGICAL TISSUE STRENGTHENING DEVICE

An-Chuan Wu, No. 217, Chien Kuo S. Rd., Taipei City, China /Taiwan

Filed June 18, 1975, Ser. No. 588,168

Int. Cl.² A61H *1/00*

U.S. Cl. 128—38 **2 Claims**



1. A device for strengthening biological tissue, particularly tissue of the female human breast, comprising a shape-retaining cup of transparent synthetic plastic material having an open side for placement over a human breast with clearance so as to define an interior space therewith, said cup having an edge portion at said open side which is formed with a recess having a curvature which curves in direction away from said open side; air-evacuating means including a pumping element operative for evacuating air from said space to thereby draw the breast further into said cup, said pumping element having resilient wall portions bounding an interior region; indicating means on said cup for indicating the distance through which the breast is drawn into said cup; flexible conduit means having an interior passage intermediate said cup and said pumping element; inlet valve means for establishing communication between said interior passage of said flexible conduit means and said interior region of said pumping element, including a substantially ball-shaped valve member and an air flow passage in which said valve member is mounted, said air flow passage having an annular valve seat intermediate said interior passage and said interior region which is normally out of engagement with said valve member so as to admit air from said interior space into said interior region via said interior passage; outlet valve means for establishing communication between said interior region of said pumping element and the ambient atmosphere at the exterior region of said element, including another substantially ball-shaped valve member and another air flow passage in which the latter is mounted, said other air flow passage having an annular valve seat intermediate the interior and exterior regions of said element which is out of engagement with said other valve member when said resilient wall portions are urged towards each other so as to permit air in the interior region of said element to pass towards the exterior region of the latter; and means on said flexible conduit means for adjustably admitting ambient air into said interior space so as to release the vacuum condition in said cup caused by operation of said valve means and said pumping element, said air-admitting means including a bypass passage communicating said interior passage with the ambient atmosphere and being formed with an auxiliary annular valve seat, and an adjustable element mounted for turning movement on said conduit means and having a tapered leading end portion movable between respective positions in which said leading end portion is moved into and out of engagement with said auxiliary valve seat so as to regulate the amount of air entering said interior passage and thereby vent the vacuum in said cup.

4,029,089

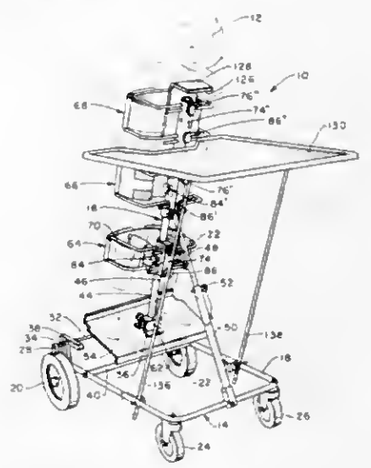
PRONE STANDER

Lawrence K. Mulholland, 985 Ann Arbor, Ventura, Calif. 93003

Filed June 14, 1976, Ser. No. 695,767

Int. Cl.² A61F *3/00*

U.S. Cl. 128—80 R **15 Claims**

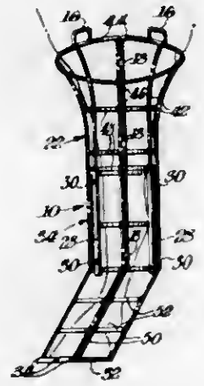


1. A prone stander comprising:

a base assembly adapted to rest upon a planar supporting surface;

a center post assembly mounted upon said base and extending upwardly therefrom;
a brace assembly interconnecting said center post assembly and said base assembly, said brace assembly to maintain an established position of said center post assembly upon said base assembly;
at least three in number of supports mounted upon said center post assemblies with there being a knee support and a hip support and a chest support, said chest and knee supports being separately longitudinally adjustable upon said center post assembly and fixable in a selected position, each of said supports including lateral adjustment means for providing lateral separate adjustment of each said support in respect to said center post assembly, each said support having an outer side wall structure for providing lateral support for the user in the outerward direction; and
strap means connected to each said support for securing the user in position within said support.

4,029,090
HORSE FORELEG BRACE
Garrett W. Dawson, Jr., Triple D Farm (Box 187 A), Greensboro, Md. 21639
Filed July 26, 1976, Ser. No. 708,744
Int. Cl.² A61F *5/04*
U.S. Cl. 128—87 R **6 Claims**



1. A weight bearing foreleg brace for a quadruped for keeping weight off an injured foreleg comprising:
a. a framework of circumferentially arranged vertical rod members shaped to correspond to the silhouette of a quadruped foreleg and foot, extending from the shoulder to beneath the foot of the quadruped;
b. horizontal ring members, said ring members being spaced vertically between the shoulder and the foot, each ring member encircles the corresponding portion of the foreleg, each ring member being attached to the vertical rod members by fastening means, said ring members including an uppermost ring member adapted to engage the shoulder of the quadruped and support the weight of the quadruped, each ring member being adapted to open and close for placement or removal of the brace from said foreleg;
c. hinge means deposed vertically on the periphery of the brace to allow ring members to open and close;
d. latch means deposed vertically on the periphery of the brace to hold the brace in the closed position after it has been placed on a foreleg; and
e. plate means attached to the bottom ring member to close the bottom of the brace.

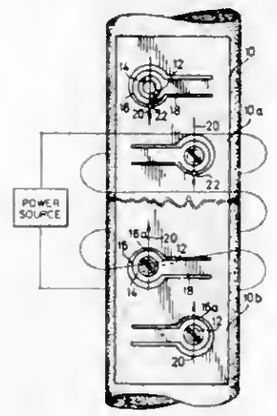
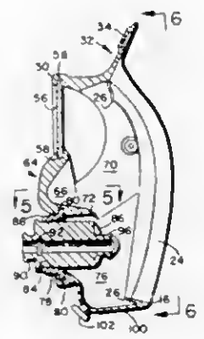
OSTEOSYNTHESIS
Götz-Dietrich von Bezold, 34 Ammerseestr., Gauting, and Werner Kraus, 13 Bauerstr., Munich, both of Germany
Filed Aug. 11, 1975, Ser. No. 603,562
Claims priority, application Germany, Aug. 12, 1974, 2438669
Int. Cl.² A61B *17/18;* **A61F** *5/04*
U.S. Cl. 128—92 D **8 Claims**



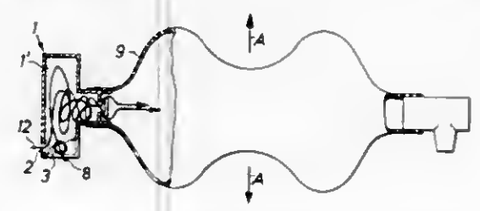
7. An osteosynthesis plate for application across a fractured site of a fractured bone, said plate having at least two screw holes spaced in a longitudinal direction of said plate wherein resilient means including magnetic materials is provided between said screw holes allowing a mutual displacement of said screw holes upon application of a magnetic field, said movement being restricted essentially to said longitudinal direction; and means generating a magnetic field and located to act on said magnetic materials.

4,029,092
COMPARTMENTALIZED FULL FACE MASK
Bevly Boone Morgan, Santa Barbara, Calif., assignor to U. S. Divers Co., Santa Ana, Calif.
Filed Sept. 17, 1973, Ser. No. 397,824
Int. Cl. A62b *7/02*
U.S. Cl. 128—141 R **9 Claims**



1. A diving mask comprising:
a major casing having a wall portion defining a major cavity of said mask and a trailing edge thereof wherein said wall surfaces at the trailing edge are adapted for placement against a user's face;
a partition dividing the major cavity into upper and lower portions of the cavity providing upper and lower cavities substantially separated from each other during usage by a diver with a frontal opening in the lower cavity having a flanged groove surrounding the interior surface thereof;
a substantially stiffened member with less flexibility than said casing having a passage therein held in the frontal opening of the lower cavity in the flanged groove for sealing the frontal area thereof and adapted to receive a source of breathing gas through the opening in said member; and,
a conduit passing through the passage of said substantially stiffened member and engaging the walls of said passage on the outer surface of said conduit to prevent the passage of water between said conduit and passage interface which is adapted to be connected at one end to a source of breathing gas, and which can slide inwardly and outwardly therethrough for removal and adjustment thereof with respect to a user's mouth.

4,029,093
GAS SUPPLY DEVICE
Øle Bjørn Køhnke, Kgs. Lyngby, Denmark, assignor to Ruth Lea Hesse, Rungstead Kyst, Denmark
Filed Sept. 19, 1975, Ser. No. 614,954
Claims priority, application Sweden, Sept. 20, 1974, 7411882
Int. Cl.² A61M *16/00*
U.S. Cl. 128—145.7 **9 Claims**



1. In a device for administering to a patient a mixture of a first gas and at least one second gas in a desired, predetermined ratio between 0 and 100%, the first gas being supplied to the device by a non-pressurized system and the second gas being supplied to the device under pressure; the device including a self-expanding, lung-venting bladder having an inlet through which the gases are introduced into the bladder and an outlet through which the gases are administered to a patient; a check valve disposed in the zone of the bladder inlet for preventing the gases from escaping from the bladder through the bladder inlet; the bladder being adapted to expand for drawing the gases thereinto through the bladder inlet; the bladder being adapted to be compressed for discharging the gases therefrom through the bladder outlet; the improvement comprising a suction valve having
a. a housing means defining a chamber having a first wall and a second wall parallel-spaced from said first wall and a circular wall adjoining said first and second walls;
b. means defining, in said housing means, a valve outlet disposed in said first wall centrally with respect to said chamber, said valve outlet being connected to said bladder inlet for maintaining communication between said chamber and said bladder inlet;
c. means defining, in said housing a suctional intake opening positioned radially outwardly of said valve outlet and being in continuous communication with the non-pressurized system; said bladder, during its expansion, generating a pressure drop from said suctional intake opening to said valve outlet; and
d. at least one inlet nozzle extending through said circular wall and supported adjacent said suctional intake opening and being oriented tangentially with respect to said chamber and substantially perpendicular with respect to said valve outlet for injecting said second gas tangentially into said chamber; said inlet nozzle being arranged for controlling, with said second gas, the intake of said first gas by changing said pressure drop in an inverse relationship to the intake of said second gas.

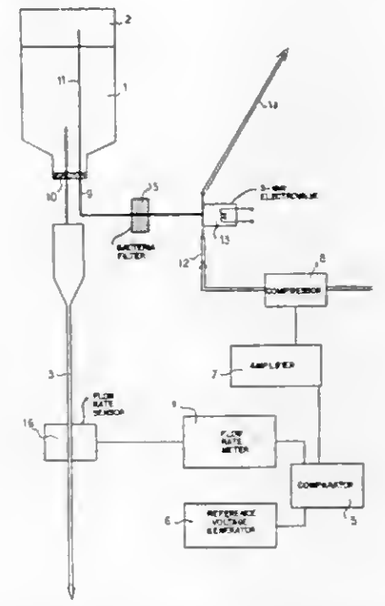
DEVICE FOR REGULATING PERFUSION FLOWRATE
Bernard Winickl, Neuilly sur Seine, France, assignor to Union Chimique Continentale - U.C.C. Societe Anonyme, Puteaux, France
Filed Feb. 17, 1976, Ser. No. 658,718
Claims priority, application France, Mar. 4, 1975, 75.06677
Int. Cl.² A61M *5/14*
U.S. Cl. 128—214 F **5 Claims**

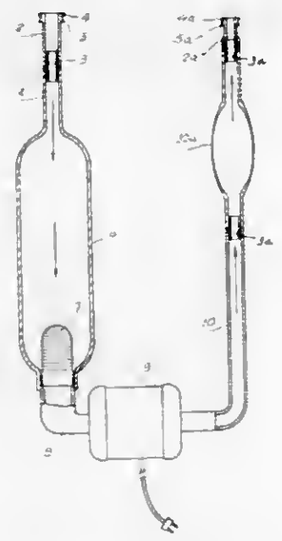


1. A device for regulating perfusion flow rate, notably of a rapid perfusion flow rate, comprising:
an air compressor;
an air pipe fed by said compressor;
a perfusion reservoir, air-fed by said pipe;
a perfusion tubing, liquid-fed by said reservoir;
a flow rate sensor connected to said tubing;
a flow rate meter driven by said sensor and furnishing a measuring voltage;
reference voltage generator means for furnishing a perdetermined reference voltage corresponding to the desired flow rate;
comparator means for comparing said measuring voltage with said reference voltage and for furnishing a differential voltage; and
control means, driven by said differential voltage, for controlling the speed of said compressor relative to said differential voltage.

4,029,095
DEVICE FOR CIRCULATING TREATING FLUID THROUGH THE NASAL FOSSAE
Jose Baya Pena, Paseo Generalisimo 98, Masnou (Barcelona), Spain
Filed Jan. 9, 1976, Ser. No. 647,788
Claims priority, application Spain, Jan. 10, 1975, 208987
Int. Cl.² A61M *7/00*
U.S. Cl. 128—250 **10 Claims**

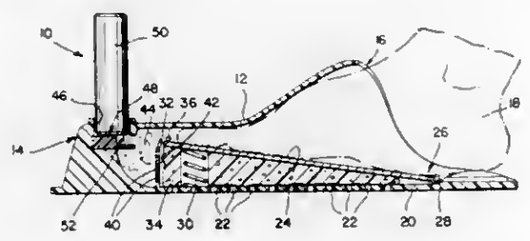
1. In a device for circulating a treating fluid through the nasal fossae, pump means having separate from each other a suction inlet and pressure outlet, suction tubular means communicating with said suction inlet and pressure tubular means communicating with said pressure outlet, said pump means cooperating with said suction and pressure tubular means for creating suction in said suction tubular means and pressure in said pressure tubular means, said suction and pressure tubular means respectively having distant from said pump means end portions which respectively carry a pair of means for placing said end portions respectively in communication with the nasal fossae, so that when a treating fluid is situated in one of

said tubular means, said pump mean may be operated for circulating in a closed circuit in only one direction the treating fluid through the nasal fossae with the treating fluid entering under pressure from said pressure tubular means into one



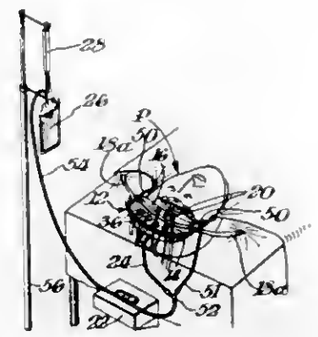
nasal fossa and being withdrawn through the other nasal fossa while entering from the latter into the suction tubular means to again be delivered by said pump means to said pressure tubular means.

4,029,096
FOOT POWDER DISPENSING DEVICE
George Fust, 44 Kunigunda Place, Islip Terrace, N.Y. 11752
Filed Aug. 3, 1976, Ser. No. 711,257
Int. Cl.² A61M *35/00*
U.S. Cl. 128—265 5 Claims



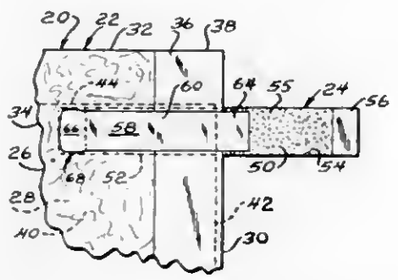
1. A foot powder dispensing device comprising in combination:
- a housing open at one end thereof for reception of a foot and including a base having a plurality of apertures therein;
- a substantially air-impermeable treadle element pivotably mounted at one end thereof on said base within said housing;
- a spring member interposed between said base and said treadle element and adapted to bias the free end of such treadle element upwardly;
- an upstanding wall having a plurality of apertures therein positioned within said housing adjacent the free end of said treadle element and defining together with the surrounding inner surfaces of said housing a powdering chamber;
- an opening adjacent the other end of said housing adapted to receive the support a container for foot powder; means for selectively effecting communication between the container and said powdering chamber; whereby actuation of said treadle element by a foot effects the flow of a stream of air through said apertured wall and into said powdering chamber and the entrainment of a quantity of foot powder therein and the application of the powder-laden air to and between the toes of the foot.

4,029,097
SURGICAL SPONGE COLLECTOR AND DRAINAGE SYSTEM
Pierre L. LeRoy, Wilmington, Del., assignor to New Research and Development Laboratories, Inc., Wilmington, Del.
Filed July 25, 1975, Ser. No. 599,016
Int. Cl.² A61M *1/100*
U.S. Cl. 128—276 16 Claims



1. A surgical sponge collector and drainage system comprising a tray having a bottom wall and side walls and terminating at its top in a peripheral rim, one of said side walls having a smooth concave contour for fitting against the body of a patient, a flat horizontal shelf in said tray disposed between said bottom wall and said peripheral rim, a fluid-tight closed compartment being between said shelf and said bottom wall, said shelf comprising support means for used sponges, a plurality of perforations in said shelf whereby fluid may drain from said sponges through said shelf and into said compartment formed between said shelf and said bottom wall, strap means on said tray extending laterally beyond said contoured side for urging and maintaining said contoured side in contact with the patient, said strap means comprising the sole fastening means for suspending said tray away from the patient and being supported only at said contoured side in cantilevered fashion, and said strap means being adjustable to provide a means for cantilevered leveling the orientation of said tray.

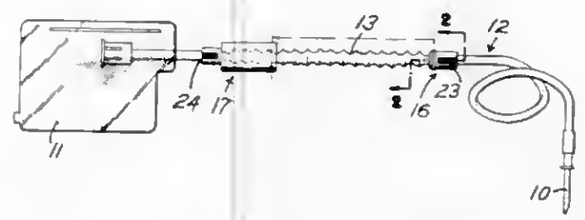
4,029,098
TAPE FASTENER FOR DISPOSABLE DIAPER
Hamzeh Karami, Crystal Lake, Ill., assignor to Colgate-Palmolive Company, New York, N.Y.
Filed Nov. 10, 1975, Ser. No. 630,398
Int. Cl.² A61F *13/16*
U.S. Cl. 128—284 21 Claims



1. A disposable diaper, comprising:
- an absorbent pad assembly having an absorbent pad, opposed surfaces, and at least one side edge; and
- a tape fastener comprising, a pressure-sensitive tape strip having an outer securement section for securing the diaper about an infant, and a release sheet associated with the securement section and having an inner portion permanently joined to one of said surfaces of the pad assembly over the pad as a unitary piece by being fused with a heat sensitive plastic material, with said sheet extending

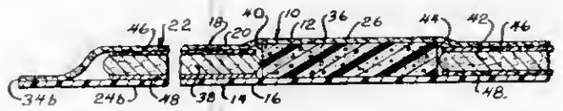
from said inner portion toward said side edge of the pad assembly.

4,029,099
URINE DRAINAGE APPARATUS
Loretta Alice Fifield, 609 Schwab Road, Hatfield, Pa. 19440
Filed Dec. 4, 1975, Ser. No. 637,538
Int. Cl.² A61F *5/44*
U.S. Cl. 128—295 4 Claims



1. A urinary drainage apparatus which comprises a urinary drainage catheter, a urine holding container, a continuous tube on the order of four feet in length connecting them together and through which urine flows from the catheter directly to and into the container, said tube having a bellows-like section which is expansible so the tube will be long and permit the wearer to move about without dislodging the catheter and is collapsible so the tube will be short and relatively free of entanglement if the person's movement is restricted, and coacting means which engage the tube at the ends of said section and which can be brought together in an interlocking relationship to retain said section in collapsed formation.

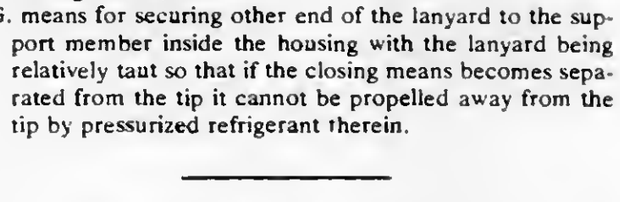
4,029,100
SHAPE RETAINING DIAPER
Hamzeh Karami, Crystal Lake, Ill., assignor to Colgate-Palmolive Company, New York, N.Y.
Filed Jan. 5, 1976, Ser. No. 646,702
Int. Cl.² A61F *13/16*
U.S. Cl. 128—284 16 Claims



1. A disposable diaper comprising, an absorbent pad assembly having a pair of waistline portions, a crotch portion intermediate said waistline portions, a backing sheet, a fluid pervious cover sheet, and absorbent pad means positioned between the backing and cover sheets, said pad means comprising a first absorbent pad including a hydrophilic material and defining a front surface of the pad means between the crotch portion and waistline portions of the pad assembly, and a second pad in said crotch portion of a material which has a large wet resiliency relative said first pad to maintain the shape of said crotch portion when wetted and placed under loads during use of the diaper.

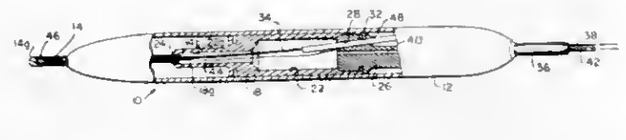
4,029,101
ABSORBENT ARTICLE
Sheldon R. Chesky, Algonquin, and Donald Patience, Barrington, both of Ill., assignors to Colgate-Palmolive Company, New York, N.Y.
Division of Ser. No. 503,887, Sept. 6, 1974, Pat. No. 3,954,107. This application Nov. 13, 1975, Ser. No. 631,768
Int. Cl.² A61F *13/16*
U.S. Cl. 128—290 R 9 Claims

1. Absorbent pad means for the perineum comprising, an elongated absorbent base pad having a front surface, a back surface, and a pair of outer side surfaces connecting said front and back surfaces, a pair of elongated top pads disposed in a side-by-side relationship and overlying the front surface of the base pad, said top pads being separate from said base pad and having a front surface for facing the perineum, a back surface facing the front surface of the base pad, and inner and outer side surfaces connecting the front and back surfaces, a fluid impervious sheet covering the back and outer side surfaces of the base pad and the outer side surfaces of the top pad, and a fluid pervious outer top sheet covering the fluid impervious



sheet, the front, inner side, and back surfaces of the top pads and the front surface of the base pad, said fluid impervious and top sheets connecting said top pads to the base pad adjacent said outer side surfaces and the respective portions of said top sheet covering the inner side surfaces of the top pads being free of attachment in a fluid receiving region of the pad to permit relative free movement of the top pads aways from each other in the fluid receiving region and enlargement of a fluid receiving channel between the top pads.

4,029,102
CRYOSURGICAL PROBE TIP
J. P. Barger, Winchester, Mass., assignor to Dynatech Corporation, Burlington, Mass.
Filed Sept. 9, 1975, Ser. No. 611,630
Int. Cl.² A61B *17/36*
U.S. Cl. 128—303.1 2 Claims



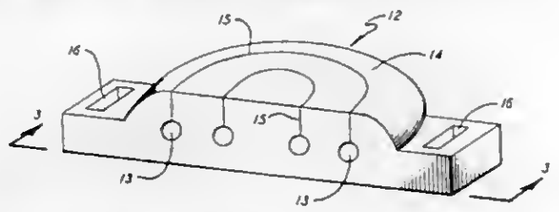
1. A cryosurgical probe comprising
- A. housing,
- B. a support member inside the housing,
- C. a tubular probe tip having
  1. one end connected to the support member inside the housing,
  2. its opposite end projecting an appreciable distance from the housing, and
  3. for receiving refrigerant under pressure.
- D. means closing the exposed end of the tip to form a tip end having a polished finished exterior surface,
- E. an inextensible lanyard having good tensile strength extending into the probe tip,
- F. means for securing one end of the lanyard directly to the closing means, and
- G. means for securing other end of the lanyard to the support member inside the housing with the lanyard being relatively taut so that if the closing means becomes separated from the tip it cannot be propelled away from the tip by pressurized refrigerant therein.

4,029,103
ANCHORING PLATE FOR MEDICAL TUBES
Francis P. McConnell, 515 Brook St., Mamaroneck, N.Y. 10543
Filed Aug. 11, 1975, Ser. No. 603,301
Int. Cl.² A61M *25/00*
U.S. Cl. 128—348 14 Claims

1. A device for anchoring through an interference fit and

directing medical tubing comprising a multi-faced plate of flexible, resilient material having

a. at least one internal curved passageway with a cross sectional area at least in segments thereof no longer than the cross sectional area of the tubing to be anchored, open at its ends to at least one face of said plate, and
b. a slit communicating a face of said plate with said passageway along its entire length, wherein the plate is provided with two slots remote from each other and from the passageway and extending completely through the plate, and wherein the device further comprises a belt adapted to pass through one slot, over the slit face of the plate which is in communication with the passageway, through the other slot, and around a convenient member of a patient, so as to provide an additional safeguard against accidental freeing of the tubing from the passageway.

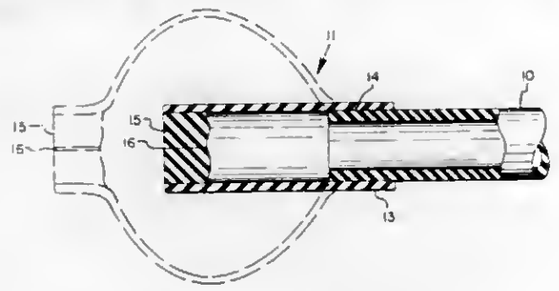


4,029,104

CALIBRATED LEAK BALLOON MICRO-CATHETER

Charles W. Kerber, 3728 SW. Beaverton Ave., Portland, Oreg. 97201

Filed Mar. 8, 1976, Ser. No. 664,503
Int. Cl.² A61M 25/00
U.S. Cl. 128—348 6 Claims



1. A single lumen flow guided balloon catheter for use in small blood vessels in a body organ such as a brain or kidney, comprising a limp single lumen tube, a balloon having a proximal end connected to the distal end of said tube with the balloon extending beyond the end of said tube, said balloon comprising an imperforate hollow cylinder of silicone rubber, a deposit of liquid silicone rubber which cures to form a plug in the distal end of said cylinder, and a restricted orifice cut through said plug to discharge fluid from said lumen, said orifice maintaining sufficient back pressure in fluid supplied under pressure through said lumen to inflate the balloon for pulling the catheter through a blood vessel by the flow of blood in the vessel.

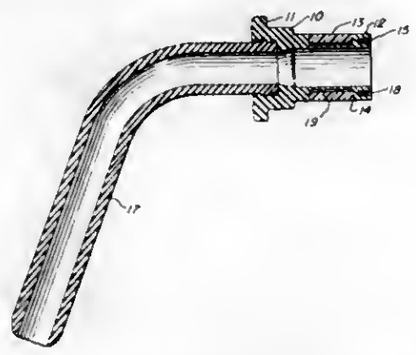
4,029,105

TRACHEOSTOMY AND ENDOTRACHEAL UNITS

Robert C. Faust, Greenfield, Wis., assignor to Will Ross, Inc., Milwaukee, Wis.

Filed Nov. 26, 1975, Ser. No. 635,684
Int. Cl.² A61M 25/00
U.S. Cl. 128—351 4 Claims

1. In a tracheostomy tube strap having a portion adapted for retention on a patient and an integral, resilient tubular connector having a ferrule on the outer surface thereof for operable engagement with respiratory apparatus, the improvement which comprises a non-resilient annular member contained within the wall of the tubular connector at a position intermediate the ferrule and the distal end of the connector, whereby said annular member prevents removal of the ferrule.



4,029,106

AROMATIC COMPOSITIONS

Edouard Demole, Geneva, Switzerland, assignor to Firmenich S.A., Geneva, Switzerland

Division of Ser. No. 482,776, June 24, 1974, Pat. No. 3,920,027, which is a division of Ser. No. 219,136, Jan. 19, 1972, Pat. No. 3,840,023. This application June 12, 1975, Ser. No. 586,310
Claims priority, application Switzerland, Jan. 19, 1971, 773/71; June 23, 1971, 9156/71; Jan. 11, 1972, 380/72
The portion of the term of this patent subsequent to Feb. 10, 1993, has been disclaimed.
Int. Cl.² A24B 15/04
U.S. Cl. 131—17 R 3 Claims

3. A tobacco flavouring composition which comprises 3-isopropyl-cyclopent-2-en-1-one. comprises 3-isopropyl-cyclopent-2-en-1-one.

4,029,107

AROMATIC COMPOSITIONS

Edouard P. Demole, Geneva, Switzerland, assignor to Firmenich S.A., Geneva, Switzerland

Division of Ser. No. 482,776, June 24, 1974, Pat. No. 3,920,027, which is a division of Ser. No. 219,136, Jan. 19, 1972, Pat. No. 3,840,023. This application June 12, 1975, Ser. No. 586,382
Claims priority, application Switzerland, Jan. 19, 1971, 773/71; June 23, 1971, 9156/71; Jan. 11, 1972, 380/72
The portion of the term of this patent subsequent to Feb. 10, 1993, has been disclaimed.
Int. Cl.² A24B 15/04
U.S. Cl. 131—17 R 3 Claims

3. A tobacco flavoring composition which comprises nonane-2,5,8-trione.

4,029,108

AROMATIC COMPOSITIONS

Edouard P. Demole, Geneva, Switzerland, assignor to Firmenkh SA, Geneva, Switzerland

Division of Ser. No. 482,776, June 24, 1974, Pat. No. 3,920,027, which is a division of Ser. No. 219,136, Jan. 19, 1972, Pat. No. 3,840,023. This application June 12, 1975, Ser. No. 586,383
Claims priority, application Switzerland, Jan. 19, 1971, 773/71; June 23, 1971, 9156/71; Jan. 11, 1972, 380/72
The portion of the term of this patent subsequent to Feb. 10, 1993, has been disclaimed.
Int. Cl.² A24B 15/04
U.S. Cl. 131—17 R 3 Claims

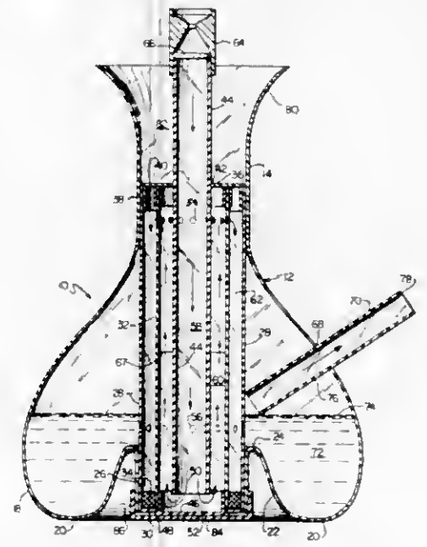
3. A tobacco flavouring composition which comprises 2-methyl-5-(α-methyl-α-hydroxyethyl)-cyclohex-2-en-1-one.

4,029,109

FLUID-COOLED SMOKING DEVICE

Richard W. Kahler, Box 61 Rte. No. 1, Rock Cave, W. Va. 26234

Filed Jan. 28, 1976, Ser. No. 653,198
Int. Cl.² A24F 1/14, 1/30
U.S. Cl. 131—173 29 Claims



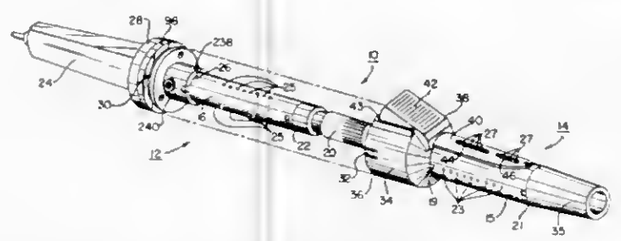
1. A fluid-cooled smoking device comprising:
housing means for containing a volume of fluid;
means for containing a supply of tobacco to be smoked;
means operatively connected to said tobacco container means for introducing smoke into said housing;
means operatively connected to said housing and projecting outwardly therefrom for withdrawing said smoke from said housing;
means interposed between said smoke introducting means and said smoke withdrawal means, and partially disposed within said fluid for defining an elongated serpentine flow path for said smoke, whereby said smoke is cooled due to the travel of the same through said elongated path and said fluid; and
ash receptacle means disposed within said serpentine flow path for accumulating ash deposits.

4,029,110

HAIR STYLING IMPLEMENT

Francis B. Hyland, Scituate, Mass., assignor to The Gillette Company, Boston, Mass.

Filed June 20, 1975, Ser. No. 588,768
Int. Cl.² A45D 2/12
U.S. Cl. 132—33 R 9 Claims



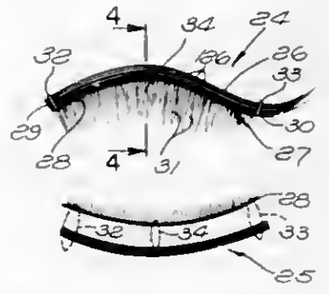
1. Hair styling apparatus comprising:
heat and steam generating means;
a handle having one end connected to said heat and steam generating means;
a cylindrical adaptor tube means having a plurality of apertures for discharging a vapor;
hair clamping means pivotally mounted on said adaptor tube for clamping a tress of hair against said adaptor tube; and
means for detachably coupling said adaptor tube and hair clamping means to said one end of said handle, said adaptor tube and hair clamping means being in thermal contact with said heat and steam generating means and rotatable about a longitudinal axis of said adaptor tube independent of rotational movement of said heat and steam generating means.

4,029,111

ARTIFICIAL EYELINER AND EYELASH STRUCTURE

Barbara J. Barton, 4261 Cahuenga Blvd. Apt. 1, North Hollywood, Calif. 91602

Filed Sept. 29, 1975, Ser. No. 617,415
Int. Cl.² A41G 3/00
U.S. Cl. 132—53 14 Claims



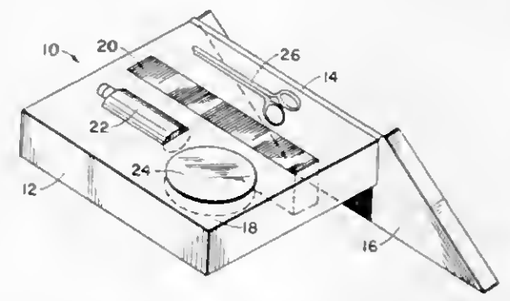
1. An eye make-up device comprising:
an elongated eyelash carrier;
a series of artificial eyelashes forming loops extending about said carrier at different locations along its length and projecting generally transversely therefrom;
a bundle of natural hair or artificial hair-simulating filaments extending generally parallel to and near said eyelash carrier at the outside of said loops formed by said eyelashes; and
means connecting said carrier and said bundle filaments together for handling as a unit and for attachment as a unit to the eyelid of a user in a position of extension longitudinally along the edge of the eyelid, with said bundle of filaments being exposed to view and being wide enough to serve as a readily visible eyeliner accentuating the appearance of the eyelashes.

4,029,112

MUSTACHE KIT

Michael Anthony Boose, Chicago, Ill., assignor to Lawrence Peska Associates, Inc., New York, N.Y., a part interest

Filed Sept. 8, 1976, Ser. No. 721,461
Int. Cl.² A45D 40/00
U.S. Cl. 132—79 R 3 Claims



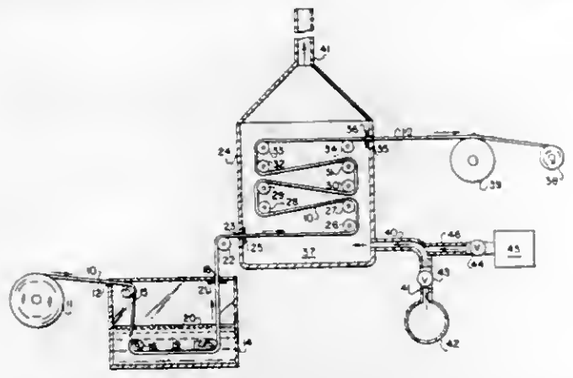
1. A mustache kit comprising box means having a lid, a tray means in said box, artificial mustaches, scissors, mustache adhesive dispensing means and mustache wax dispensing means supported on said tray.

4,029,113

WAXED DENTAL TEXTILE MATERIAL AND METHOD OF PREPARING AND USING THE SAME

William Cecil Guyton, 922 Porter Ave., Ocean Springs, Mich. 39564

Filed Feb. 20, 1975, Ser. No. 551,417
Int. Cl.² A61C 15/00
U.S. Cl. 132—91 12 Claims



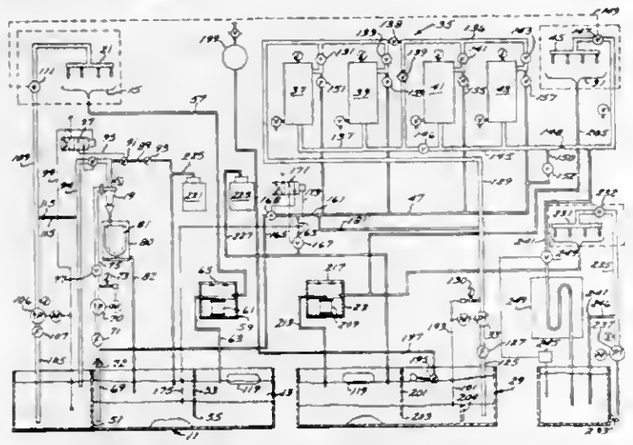
1. A method of preparing waxed dental textile material for use in removing food deposits from teeth and the gingiva comprising applying a coating of wax to dental textile material to thereby produce waxed dental textile material, the wax coating being water insoluble and solid at room temperature, the wax coating encompassing the dental textile material and having a fluorine-containing compound distributed therein which provides fluoride ion in a therapeutic amount of inhibit the formation of dental caries when the waxed dental textile material is intimately contacted with the teeth and gingiva to remove food deposits therefrom, the wax coating being applied in an amount whereby particles thereof are deposited on the teeth at the points of contact and in the general area of the gingiva and fluoride ion is slowly released therefrom over a substantial period of time, and the said fluorine-containing compound being present in the wax coating in an amount to provide about 0.0001–2% by weight of fluoride ion based upon the weight of the wax coating.

4,029,114

BACK FILTER AUTOMATIC VEHICLE WASH WATER RECLAIM SYSTEM

Dale E. Wiltrout, Wyckoff, N.J., assignor to The Allen Group Inc., Melville, N.Y.

Filed Apr. 26, 1976, Ser. No. 680,216
Int. Cl.² B08B 3/02
U.S. Cl. 134—104 5 Claims



1. A back wash filter automatic vehicle wash water reclaim systems comprising:

wash spray means for spraying water onto a vehicle passing through a wash bay formed in a vehicle path;

wash sump means disposed below the level of said vehicle path for collecting used water from said vehicle path and including partition means separating said sump means into a collector compartment and a clean water compartment;

wash drain means for draining water from said vehicle path into said collector compartment;

wash conduit means connected between said clean water compartment and said wash spray means and including wash pump means for drawing water from said sump and spraying it through said spray means;

a sludge separator for separating water from sludge;

separator conduit means leading from said collector compartment to the inlet of said sludge separator and including separator pump means;

clean water conduit means leading from the water outlet of said sludge separator to said clean water compartment;

primary rinse spray means for spraying rinse water on a vehicle passing through a rinse bay formed in said veicle path forwardly along said path from said wash bay;

rinse sump means including partition means separating said rinse sump means into a rinse water collector compartment and a rinse clean water compartment;

drain means for draining used rinse water from said rinse bay to said rinse sump means;

rinse conduit means leading from said clean rinse water compartment and including a rinse pump means;

a plurality of reverse flow filter tank sets having a forward and reverse flow direction;

filter conduit means leading from the discharge side of said rinse pump and connecting said filter tank sets in series with one another and the outlets of each set with the inlet of each other set and connecting the outlet of at least the last set of the series with said rinse spray means:

back wash conduit means connecting said filter tank inlets with one of said rinse sump means;

individual valve means in said filter and back wash conduit means for controlling flow from said rinse pump means to the inlets of said respective filter tank inlets and operative during filtering of said wash water to direct water forwardly in series through said tank sets and to said rinse spray means, said valve means being further operative during back wash of said tanks to selectively direct flow forwardly through selected ones of said sets and in the reverse direction through another of said filter tank sets; and

control means for controlling said wash pump, separator pump, wash and rinse pumps and valve means and having a rinse mode operative to direct water through said rinse pump and in series through said sets of filter tanks to said rinse spray means, said control means further having a back wash mode operative to direct water through said rinse pump means and forwardly through one of said sets and in a reverse direction through the other of said filter tank sets through said back wash conduit means to said one of said sumps.

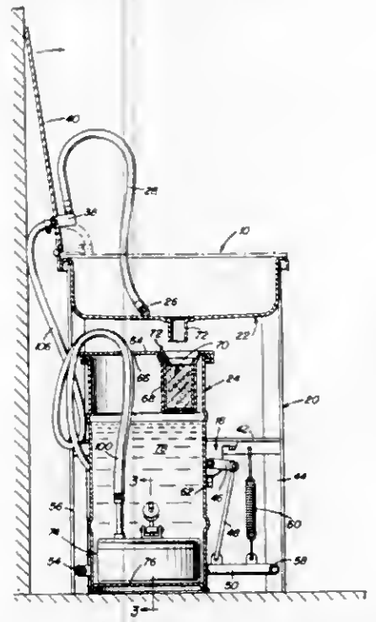
4,029,115

PARTS WASHER

Edison L. Wheeler, Monticello, Ark., assignor to Ted Wheeler and Elmer Lewis, both of Benton, Ark., part interest to each

Filed Sept. 3, 1975, Ser. No. 609,935
Int. Cl.² B08B 3/00
U.S. Cl. 134—111 1 Claim

1. A parts washer comprising a washbasin in the form of a shallow receptacle defined by a bottom wall and an upstanding peripheral wall, a base frame supporting said washbasin in elevated position above a support surface, a solvent dispensing tube having a discharge nozzle thereon supported on said washbasin to enable parts placed in the washbasin to be washed by directing the discharge nozzle toward the parts, a drain in the bottom of the washbasin to drain solvent and entrained material therefrom, a tank disposed below the washbasin and in vertical spaced relation to the bottom thereof, said tank including a quantity of liquid solvent and a cover having an inlet opening aligned with said drain, a generally cylindrical holder supported below the inlet opening, a filter cartridge positioned within the holder for filtering solvent passing therethrough by gravity flow, the lower end of the holder being open and the upper end flaring outwardly to form a funnel shaped guide for solvent discharged from the drain, said cartridge being disposed above the liquid level in the tank, means within said tank communicated with said tube and discharge nozzle for discharging pressurized solvent from the nozzle, and control means exteriorly of the tank for manually controlling operation of said solvent discharge means, said solvent discharge means including a container disposed in the bottom of said tank and including a top disposed below the level of liquid solvent in the tank, a solvent inlet opening in the container for gravity flow of solvent into the container, valve means closing said inlet opening, a discharge conduit extending from the bottom portion of the container to the solvent dispensing tube, and an air pressure line communicated with said container for pressurizing the container for pressure



discharge of solvent and air through the discharge tube, said control means including an air valve in said air line selectively pressurizing and venting said container, said valve means in the container being automatically opened by the head of liquid solvent in the tank when the container is vented and at least partially empty and being closed when the container is filled and pressurized, said valve means including a plate disposed interiorly of the container, an upwardly extending and laterally extending lever attached to said plate, means pivotally supporting said lever from the exterior of the top of the container, a counterweight mounted on said lever on the opposite side of the pivot from the plate to normally retain the plate in closed position until the head of liquid solvent in the tank above the plate is greater than the combined force exerted by the counterweight and any pressure in the container, said air valve including a foot-operated pedal positioned adjacent the front lower end of the base frame for access by a person manipulating parts and nozzle in the washbasin.

4,029,116

GERMINATING TANK FOR GERMINATING AND SOFTENING OF MALT

Paul Beyer, Maienstrasse 2, 7057 Nellmersbach, Germany

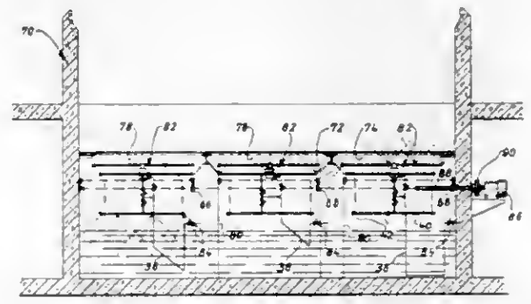
Filed Nov. 13, 1975, Ser. No. 631,704
Claims priority, application Germany, Nov. 13, 1974, 2453673
Int. Cl.² B08B 3/02, 9/00
U.S. Cl. 134—167 R 15 Claims

1. A germinating tank for germinating and softening malt supported on a grating, said tank having an aerating chamber situated below the grating, the improvement comprising in combination,

spray cleaning means operatively movably mounted in said tank below said grating;

a cleaning fluid high pressure source; and

at least partially flexible conduit means connecting said fluid high pressure source to said spray cleaning means; whereby said spray cleaning means is adopted to spray



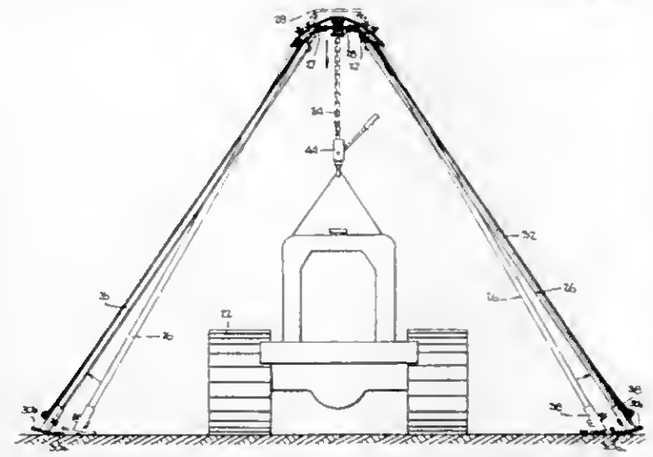
cleaning fluid onto said grating and into said aerating chamber; said spray cleaning means include a carriage movable operatively mounted in said aerating chamber, at least a pair of spray pipes supported on said carriage and being connected to said fluid high pressure source, one of said spray pipes conducting fluid to be sprayed upwardly and the other spray pipe conducting fluid to be sprayed downwardly.

4,029,117

SHELTER STRUCTURE

Lloyd Howard Rain, Lexington, Ky., assignor to Irvin Industries, Inc., Greenwich, Conn.

Filed Jan. 26, 1976, Ser. No. 652,553
Int. Cl.² A45F 1/16
U.S. Cl. 135—4 C 8 Claims



1. A shelter comprising:

a plurality of at least three rigid columns arranged relative to one another to form the edges of a pyramidical structure,

a top plate,

said columns extending out and down from said top plate, each of said columns being pivoted in solely one plane about said top plate to permit radial movement of the base of said columns,

a central tension member connected to and extending down from said top plate, said tension member being connected to an anchoring means,

a pyramidical canopy connected to said columns and having a plurality of flexible panels, one of said panels extending across each of the surfaces of said pyramid defined by said columns,

a plurality of flexible base tension members, each of said base tension members having first and second ends connected respectively to the bases of adjacent columns,

each of said base tension members being connected along its entire length on a curved line across an associated one of said panels of said canopy between adjacent ones of said columns, and

base means at the foot of each of said columns to permit radial movement of said columns in response to compressive loading of said columns,

said base tension members and said canopy being the sole restraints on radial outward movement of said columns,

loads on said canopy tending to spread said columns and cause said base tension members to decrease in curvature and to exert an increased substantially uniform tension across said panels of said canopy,

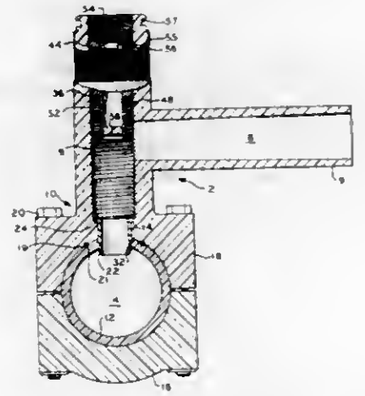
thereby preventing canopy flutter and extending canopy life.

4,029,118

TAPPING APPARATUS AND METHOD

John H. Merideth, Dallas, Tex., assignor to Phillips Petroleum Company, Bartlesville, Okla.

Filed July 3, 1975, Ser. No. 593,091
Int. Cl.² F16K *43/00*; F16L *55/10*
U.S. Cl. 137—15 **18 Claims**



1. Apparatus for tapping a conduit, said apparatus comprising:

a body means having first, second, and third passageways extending therethrough, said first passageway being adapted for accepting and maintaining a conduit to be tapped and being in communication with a first end portion of said second passageway, said first end portion of said second passageway additionally being in communication with a first end of said third passageway for providing fluid communication between said first end portion of said second passageway and a second end of said third passageway, said body means also having a seat means located on the inside wall of said first end portion of said second passageway at a location between the opening to said first passageway and the opening to said third passageway;

a sleeve means having a generally cylindrical tubular body with a first end and a second end and having an annular outwardly extending flange at said first end thereof, said flange being mateable with said seat means; and

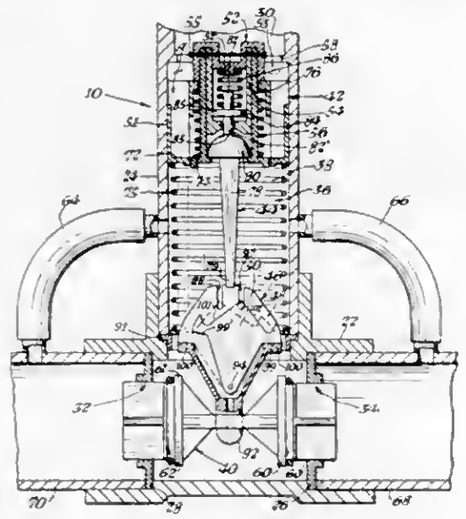
a cutter means for cutting an opening within a conduit located within said first passageway and for inserting said second end of said sleeve means into said opening, said cutter means having a generally cylindrical first end portion which is insertable into said sleeve means and a second end portion which is adapted to engage the inside wall of said second passageway, said cutter means having a passageway extending therethrough from said first end portion to said second end portion thereof.

4,029,119

VALVE AND VALVE SYSTEM

Hal Klieves, P. O. Box 5850, Pompano Beach, Fla. 33064

Filed Apr. 30, 1975, Ser. No. 573,095
Int. Cl.² F16K *31/363*
U.S. Cl. 137—119 **4 Claims**



1. An automatic valve comprising;

a body including

a fluid inlet for receiving incoming fluid,

an intermediate portion connected to said fluid inlet and,

two separate fluid outlets connected to said intermediate portion for alternately distributing the fluid, each of said outlets including valve seats,

a fluid control mechanism connected in said intermediate portion, said fluid control mechanism including

an actuating means connected in said inlet and reciprocally moveable during each cycle of incoming fluid that enters said inlet, the incoming fluid cycle begins with the initial entry of fluid, continues through the fluid flow, and ends with the termination of the fluid flow into said inlet, and

a cycling means connected to said actuating means and driven through one half of the distribution cycle by said actuating means during each incoming fluid cycle,

a drive arm connected between said actuating means and said cycling means,

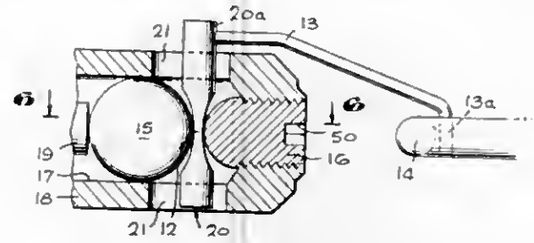
a moveable valve gating means connected in said body in a normally neutral position with both outlets open, said valve gating means connected to said cycling drive means and driven by said cycling drive means for movement of said valve gating means alternately into and out of engagement with said valve seats to open one fluid outlet and close the other fluid outlet during the first half cycle, and to close the second outlet and open the first outlet during the second half cycle, said cycling means includes a cam means and a pivotable base member for relative movement between said cam means and said base member, said drive arm contacts said cam means to drive said base member for driving said valve gating means from a neutral position to open one outlet and close the other outlet and to cock said cam means into another position to receive said drive arm from the neutral position to drive said base member during the next half-cycle, said cycling means includes a biasing means to move said base member and said valve gating means back into a neutral position.

4,029,120

LINKAGE FOR THE DEMAND REGULATOR OF A BREATHING APPARATUS

Raymond A. Christianson, P.O. Box 1513, Manhattan Beach, Calif. 90266

Division of Ser. No. 508,580, Sept. 23, 1974, abandoned. This application June 30, 1975, Ser. No. 591,711
Int. Cl.² F16K *31/12*
U.S. Cl. 137—494 **13 Claims**



10. In a demand regulator for a breathing apparatus, the improvement comprising;

a flow valve for controlling the flow of breathable gas from a source to a mouthpiece, said flow valve having a control element extending therefrom, and

a diaphragm for sensing inhalation demand, and

a linkage between said diaphragm and said flow valve control element, said linkage comprising;

a first, relatively movable member having a arcuate surface, said control element being moved by said first member,

a second, relatively fixed member having an arcuate surface facing the arcuate surface of said first member, and

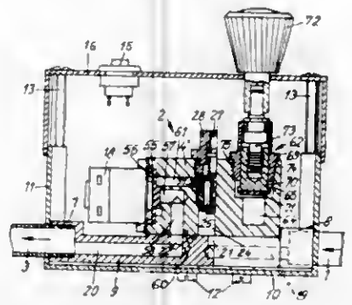
a lever situated between said two arcuate surfaces and linked to said diaphragm so that displacement of said diaphragm causes said lever to pivot about said arcuate surfaces, thereby moving said first member and imparting movement to said control element to operate said flow valve.

4,029,121

VALVE CONSTRUCTION FOR CONTROLLING A LIQUID SUPPLY TO ONE OR MORE DISCHARGE POINTS

Gunter Buzzi, Schiltach, Schwargwold, Germany, assignor to Fa.Hans Grohe KG., Germany

Filed Sept. 2, 1975, Ser. No. 609,484
Claims priority, application Germany, Sept. 5, 1974, 2442482
Int. Cl.² F16K *19/00*
U.S. Cl. 137—545 **9 Claims**



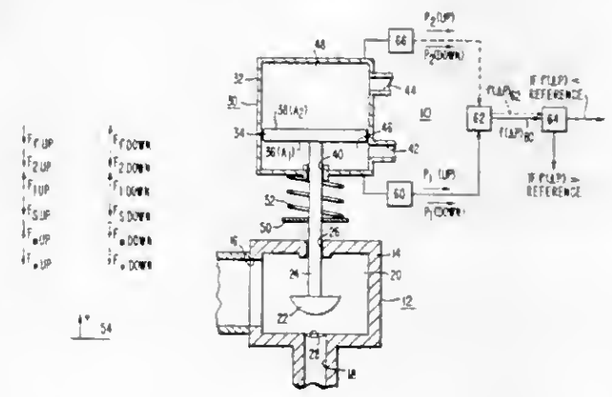
1. A valve arrangement for controlling the water supply to at least one discharge line, comprising housing means having an inlet passage, at least one discharge passage spaced from said inlet passage and having a flow control chamber between and in communication with said inlet and discharge passages, a closure member movable in said control chamber having relatively fixed respective opposite spaced apart closing surfaces adjacent respective ends thereof, guide ring means in said control chamber for said closure member defining oppositely directed axially spaced seat surfaces, a tubular screen coaxial with and surrounding a portion of said closure member, an electromagnetic valve flow passage connected between said control chamber and said discharge passage, said closure member defining with the interior said flow control chamber, when the closing surfaces are not engaged on said seat surfaces; a flow passage from said inlet passage around one of said closing surfaces through said screen to said electromagnetic flow passage, a screw cap coaxial with said screen and said closure member and engaged with said housing and closing one end of said flow control chamber and holding said screen in said flow control chamber, and a set screw coaxially threaded to said screw cap and being adjustably engageable with said closure member.

4,029,122

APPARATUS AND METHOD FOR DETERMINING FRICTION FORCES IN POSITION MODULATED VALVES

Karl O. Jaegtnes, Chester Heights, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Mar. 11, 1976, Ser. No. 665,822
Int. Cl.² F16K *37/00*
U.S. Cl. 137—551 **4 Claims**



2. In a valve for modulating the flow of a fluid having a casing, an inlet and an outlet therein, a valve plug movable from open to seated position movably mounted relative to said casing on a valve stem, said stem extending through said casing and pressurized actuator means connected to the stem for moving the valve plug, wherein said improvement comprises a device for indicating whether the friction force generated between said valve stem and said casing exceeds a predetermined value, said device comprising:

first means for generating a first signal proportional to the magnitude of a pressure force required by said actuator to move said stem a first predetermined distance in a first direction,

second means for generating a second signal proportional to the magnitude of a pressure force required by said actuator to move said stem a second predetermined distance in a second direction opposite to said first direction,

means for generating a third signal proportional to the difference between said first and second signals and functionally related to said friction force, and,

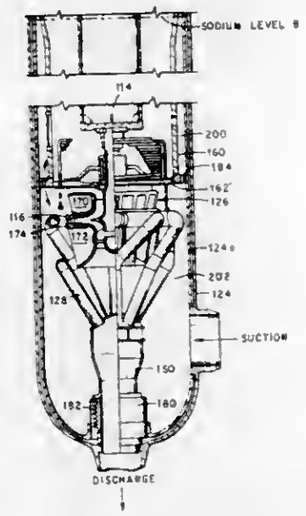
means for comparing the third signal functionally related to the friction force to a predetermined reference signal.

4,029,123

PUMP TANK DIVIDER PLATE FOR SUMP SUCTION SODIUM PUMPS

John A. George, Greensburg, and Donald R. Nixon, Murrysville, both of Pa., assignors to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed Aug. 20, 1975, Ser. No. 606,043
Int. Cl.² F04D 9/02, 13/16
U.S. Cl. 137—565 4 Claims



3. In a liquid pumping system comprising:
an enclosed, elongated, vertically oriented pump tank provided with a liquid inlet passageway; and
a centrifugal sump suction pump mounted within said pump tank, said pump having a discharge passageway extending outside said tank, and a suction inlet communicating with the interior of said pump tank, the improvement comprising means dividing the interior of said pump tank into an upper zone and a lower zone, said means positioned above said suction inlet ad adapted to restrict fluid flow between said upper and lower zones, and said liquid inlet passageway to said pump tank being in fluid communication with said lower zone.

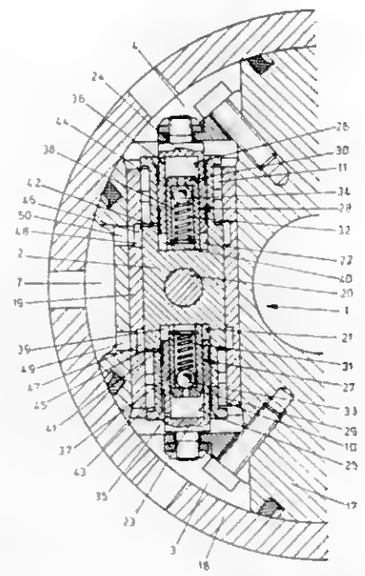
4,029,124

POWER STEERING CONTROL VALVE

Manfred Keller, Schwaebisch Gmuend, and Dieter Elser, Boegingen, both of Germany, assignors to Zahnradfabrik Friedrichshafen AG, Friedrichshafen, Germany

Filed May 9, 1975, Ser. No. 576,147
Int. Cl.² F15B 13/14
U.S. Cl. 137—596.12 12 Claims

1. A power steering control valve for servopump and double acting servomotor systems, comprising:
a piston valve (2) and means (20) for manually and bidirectionally shifting said piston valve under control of a vehicle driver;
a housing means (17, 18, 19) for said piston valve;
said piston valve having ends and said piston valve and housing means having relatively high pressure inlet means (4) wherein the ends of said piston valve are constantly exposed to inlet pressure;
said piston valve and housing means having relatively low outlet pressure return means (7) and having coacting flow control and return passage elements (47, 49) (48, 50) including passages (12, 13) whereby a shifted position of said piston valve in a respective direction directs high inlet pressure to a respective chamber of a double acting servomotor cylinder while exhausting low outlet pressure from the opposite chamber;
means defining reaction chambers (39, 40) at each end of said piston valve;
said reaction chambers having respective relief valves (27, 28) (327, 328) constantly exposed to inlet pressure and openable at a predetermined rise in inlet pressure;
means (4, 7, 10, 11, 41, 42, 51, 52, 55, 56) whereby said piston valve in shifted position is subjected to opposing pressures in said reaction chambers to effect steering resistance by unbalance of forces on said piston valve;
said means comprising passages (41, 42, 51, 52) for inlet and outlet pressure flow to said reaction chambers to effect said unbalance of forces in said shifted position of said piston valve by mixing of inlet and outlet pressures in



either reaction chamber acting against said piston valve at one end upon opening of the respective relief valve, to act against opposed inlet pressure in the other reaction chamber acting against the other end of said piston valve;
said passages (41, 42, 51, 52) comprising for each reaction chamber a restricted bore communicating between said inlet means and said reaction chamber and also having a restricted bore communicating between said reaction chamber and said return means, said bores effecting flow throttle passages.

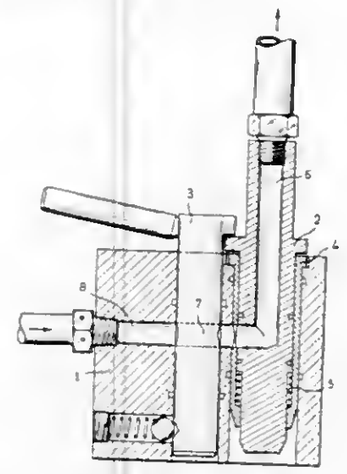
4,029,125

SNAP-FITTING PIPE CONNECTING DEVICE

Guy Steydle, and Bernard Poisson, both of Boulogne-Billancourt, France, assignors to Regie Nationale des Usines Renault, Hauts de Seine and Automobiles Peugeot, Paris, both of France

Filed Mar. 4, 1975, Ser. No. 555,105
Claims priority, application France, Mar. 6, 1974, 74.07600; Feb. 3, 1975, 75.03216
Int. Cl.² F16L 29/00
U.S. Cl. 137—614.06 2 Claims

1. A snap-fitting pipe connecting device especially usahle for directing high pressure fluids, said device comprising:
a body having an inlet fluid passage and a cavity arranged perpendicularly and being adapted to be secured to a machine structure;
a connecting member having a fluid passage formed therein and adapted to be inserted into said cavity in said body;
said fluid passage in said connecting member comprising a main section coaxial to said connecting member and a short radial section directed at right angles to said main section and arranged such that upon insertion of said connector into said cavity said radial section is axially aligned with and in communication with said inlet fluid passage whereby upon directing a fluid into said inlet fluid passage no force is exerted in a direction tending to expel said connector from said cavity;
locking means consisting of a socket adapted to slide on the outer surface of said connecting member, spring means for urging said socket, whereby when said connecting member is disconnected from said body into a release position, said socket is moved to a position in which the fluid passage in said connecting member is sealed and when said connecting member is inserted into said cavity in a lock position said socket is moved to a position to permit fluid flow from said inlet fluid passage to said axially aligned radial section; and



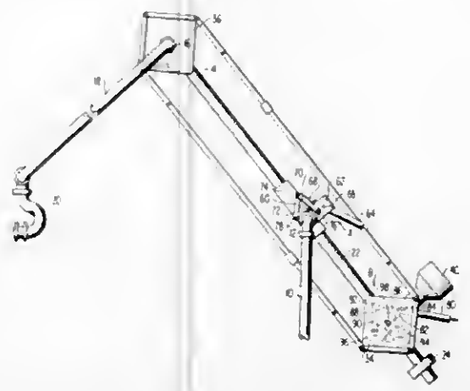
a rotatable bolt having a fluid passage therein and secured to said body for valving said inlet fluid passage and adapted to lock said connecting member in said lock position and to permit fluid flow through said inlet fluid passage and rotatable to a release position corresponding to said connecting member release position wherein said inlet fluid passage is closed.

4,029,126

ARM DRIVING DEVICE FOR FLUID LOADING APPARATUS

Nobuto Miyazaki, and Tadaya Tokahashl, both of Kanagawa, Japan, assignors to Nigata Engineering Co., Ltd., Tokyo, Japan

Filed Jan. 19, 1976, Ser. No. 650,403
Claims priority, application Japan, Mar. 14, 1975, 50-34424; June 5, 1975, 50-76340
Int. Cl.² B67D 5/00
U.S. Cl. 137—615 5 Claims



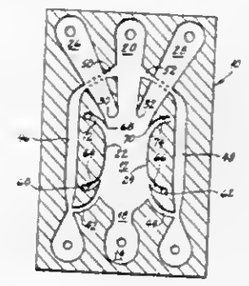
1. In a fluid loading apparatus, comprising a hollow inboard arm having one end connected for rotation in three-dimensions to a hollow stand pipe implanted on land and having an extension member to form an inner balance arm, a hollow outboard arm connected at one end thereof to the other end of said inboard arm for rotation in a vertical plane with respect thereto and having at the other end thereof a three dimensionally rotatable joint, an outer balance means and an operation means for controlling the angle between said inboard arm and said stand pipe, an improvement characterized in that said operation means comprises a first hydraulic cylinder supported rotatably by said inboard arm and having a piston rod; and a first V-link comprised of a pair of first and second link arms connected rotatably with each other at one end thereof, said first hydraulic chamber cylinder having a projecting end of said piston rod rotatably connected to a suitable portion of said link arms, the other end of said first link arm being connected rotatably to a suitable portion of said inboard arm, and the other end of said second link arm being connected rotatably to said stand pipe.

4,029,127

FLUIDIC PROPORTIONAL AMPLIFIER

Raymond V. Thompson, Simsbury, Conn., assignor to Chandler Evans Inc., West Hartford, Conn.

Continuation of Ser. No. 1,147, Jan. 7, 1970, abandoned. This application Apr. 27, 1972, Ser. No. 248,330
Int. Cl.² F15C 1/14
U.S. Cl. 137—806 10 Claims



1. A fluidic device comprising:
a reaction chamber, said chamber having first and second ends and being defined by side walls;
means for establishing a stream of a first fluid across said reaction chamber from a first end thereof;
at least a pair of outlet ports positioned in said second end of said reaction chamber to receive said first fluid stream;
fluid collecting means associated with each of said outlet ports;
conduit means coupling each of said outlet ports to its respective collecting means;
means for establishing a control flow of a second fluid, said control flow establishing means communicating with at least a first side wall of said reaction chamber, said second fluid being dissimilar to said first flow and being withdrawn from the region between said stream of first fluid and reaction chamber wall whereby a variable transverse pressure differential is created and the position of said stream of first fluid with relation to said outlet ports is regulated; and
means for establishing a fluid curtain across at least one of said conduit means.

4,029,128

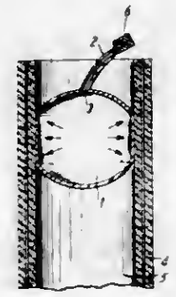
DEVICE FOR PLUGGING A HOLLOW OF A CONCRETE PILE

Shigeharu Yamagishl, No. 296, Nakakawahara, Namerikawa, Toyama, Japan

Continuation of Ser. No. 495,311, Aug. 7, 1974, abandoned. This application July 7, 1975, Ser. No. 593,190
Claims priority, application Japan, Aug. 10, 1973, 48-90187
Int. Cl.² F16L 15/10
U.S. Cl. 138—89 1 Claim

1. A method for plugging the center of a vertical hollow concrete pile driven into the ground comprising introducing into the hollow pile an air bag made of a flexible material impervious to air, inflating said bag from a source of air under pressure in an amount sufficient to force the bag into tight engagement with the interior side walls of said pile, disconnecting the bag from the source of air and closing the same while under pressure, and introducing concrete onto the top

of the pile to subject the inflated bag to the weight of the concrete to compress the confined air therein and thereby



urge the bag into tighter frictional engagement with said interior side walls during the plug formation.

4,029,129

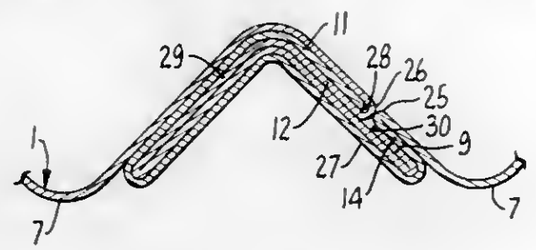
HELICAL PIPE LOCK SEAM

Laffie Harper, Box 276, San Bruno, Calif. 94066

Filed Mar. 26, 1976, Ser. No. 670,775

Int. Cl.² F16L *11/16*

U.S. Cl. 138—135 **3 Claims**



1. In a pipe formed from a helically coiled strip of ductile material having a main body connected along its longitudinally extending edges by a seam, said seam comprising:

a. first and second marginal portions respectively along and parallel with said edges having adjacent return bends at opposite sides of a plane extending between and parallel with said bends;

b. said marginal portions including flattened loops disposed at the same side of said plane, each extending from one of said bends to substantially the other, with one of said loops enclosed within the other;

c. said loops being bent along a line spaced from and parallel with said bends forming a generally V-shaped corrugation in cross sectional contour transversely of said bends with said bends positioned in one of the sides of said corrugation and with flattened portions of said loops extending across and along opposite sides of the apex of said corrugation.

4,029,130

WEFT YARN GRIPPING ELEMENT FOR LOOMS

Graziano Genini, Stabio, Switzerland, assignor to Albatex A.G., Vaduz, Liechtenstein

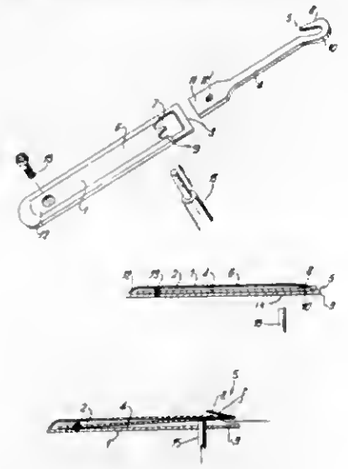
Filed Sept. 23, 1975, Ser. No. 616,060

Claims priority, application Switzerland, Sept. 23, 1974, 12833/74

Int. Cl.² D03J *5/06*

U.S. Cl. 139—196.2 **4 Claims**

1. Weft yarn gripping and transporting element comprising an elongated flat body of aerodynamic shape comprising yarn gripping means at its extremity, said yarn gripping means comprising a hooked blade resiliently urged against a lower extension of the body, said body having upper and lower parts disposed above and below said blade, respectively, said upper part at its end adjacent the hook of the blade having a recess for reception of said hook, said blade having a part by which it is connected to said hook, said upper part of said body



having therein a further recess for the reception of said connecting part.

4,029,131

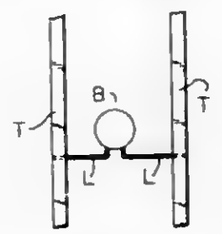
NON-AXIAL LEAD ELECTRICAL COMPONENT PREPPER-TAPER APPARATUS

Albert W. Zemek, Windsor; Robert H. Holmes, and David L. Merithew, both of Binghamton, all of N.Y., assignors to Universal Instruments Corporation, Binghamton, N.Y.

Division of Ser. No. 650,674, Jan. 20, 1976, Pat. No. 3,987,528. This application Sept. 1, 1976, Ser. No. 719,516

Int. Cl.² B21F *45/00*

U.S. Cl. 140—105 **8 Claims**



1. A device for removing non-axial lead electrical components from a manufacturing strip and forming the leads into a substantially axial lead configuration comprising:

a base;

support means mounted to said base to locate and support said manufacturing strip;

holder means slidably mounted to said base;

gripper means mounted to said holder means for engaging the leads of said electrical component and removing said electrical component from said manufacturing strip by lateral movement of said holder means;

forming means mounted to said holder means for bending the axial leads into a substantially axial lead configuration; and

drive means connected to said holder means, gripper means and forming means for causing said gripper means to engage said leads, said holder means to move laterally to remove said components from the manufacturing strips and said forming means to bend said leads.

4,029,132

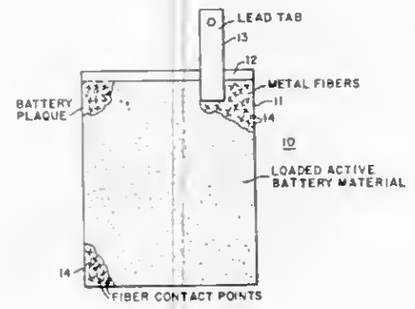
METHOD OF PREPARING HIGH CAPACITY NICKEL ELECTRODE POWDER

John F. Jackovitz, Monroeville, and Earl A. Pantier, Verona, both of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed May 24, 1976, Ser. No. 689,624

Int. Cl.² H01M *4/32, 4/52*

U.S. Cl. 141—1.1 **20 Claims**



1. A method of producing a battery electrode plate containing active battery material, comprising the steps of:

a. mixing NiO and Na_2O_2 in a weight ratio of NiO:Na_2O_2 of between about 1:1.20 to about 1:1.60 with an amount of an oxygen containing alkali metal fluxing material selected from the group consisting of alkali metal molybdates, alkali metal tungstates, alkali metal vanadates, alkali metal carbonates, alkali metal nitrates and mixtures thereof, effective to allow fuse-melting of the NiO and Na_2O_2 at temperatures of between about 650° C to about 925° C;

b. heating the mixture of NiO, Na_2O_2 and fluxing material between about 650° C to about 925° C to melt-fuse the mixture and to form $NaNiO_2$;

c. hydrolyzing the $NaNiO_2$ in water at between about 20° C to about 95° C to form active battery material;

d. maintaining the activity of the battery material by maintaining the temperature of the material below about 65° C; and

e. applying the battery material to a porous metallic plaque.

15. A method of making an active battery electrode powder, comprising the steps of:

a. mixing an admixture of nickel oxide and Na_2O_2, in a weight ratio of nickel oxide:Na_2O_2 of between about 1:1.20 to about 1:1.60 with an amount of an oxygen containing, alkali metal fluxing material selected from the group consisting of alkali metal molybdates, alkali metal tungstates, alkali metal vanadates, alkali metal carbonates, alkali metal nitrates and mixtures thereof, effective to allow fuse-melting of the nickel oxide and Na_2O_2 at temperatures between about 650° C to about 925° C;

b. heating the admixture at a reaction temperature of between about 650° C to about 925° C, to melt-fuse the admixture and form a reaction product comprising $NaNiO_2$; and

c. hydrolyzing the reaction product comprising $NaNiO_2$ in water at between 20° C to about 95° C, forming a battery material comprising Ni hydroxide forms.

4,029,133

PROCESS FOR MECHANICALLY EMPTYING POWDERY SUBSTANCES INTO A CONTAINER, AND DEVICE FOR CARRYING OUT THE PROCESS

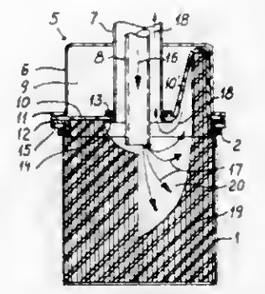
Robert Rottermann, Adliswil, and Marcel Rottermann, Gattikon, both of Switzerland, assignors to Gericke AG, Maschinenfabrik, Regensdorf, Switzerland

Filed Oct. 17, 1975, Ser. No. 623,365

Claims priority, application Switzerland, Nov. 26, 1974, 15660/74

Int. Cl.² B65B *1/24*

U.S. Cl. 141—12 **6 Claims**



1. A process for mechanically emptying powdery substances into a rotating container wherein the filling space rotates during the filling process, characterized by the steps of:

introducing said substance in an amount corresponding to the nominal volume of the container into a filling space;

simultaneously enlarging said filling space by an additional volume, during rotation of said container in comparison with the nominal volume of the container; and

subsequently compressing said amount of said substance into the container by reducing said filling space by said additional volume.

4,029,134

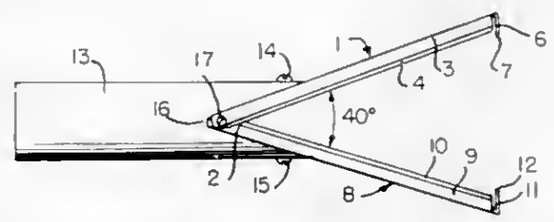
DEVICE FOR REMOVING CIRCUMFERENTIALLY BARK FROM PLANTS

Ralph M. Cook, deceased, late of Hialeah; Ruth Nelson, Personal Representative of the Estate Cook, 6060 W. 10th Ave., Hialeah, Fla. 33012, and Don T. Roach, 951 E. 33rd St., Hialeah, Fla. 33013

Filed Feb. 3, 1976, Ser. No. 654,778

Int. Cl.² B27L *1/00*

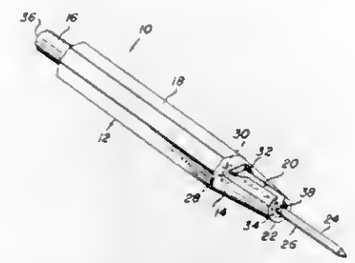
U.S. Cl. 144—208 C **4 Claims**



1. A hand operable device for circumferentially removing a secion of bark from plants, characterized by an upper and a lower jaw, said jaws being jointed at one end forming an angle at its base therebetween sufficiently large to permit the introduction of the plant with bark thereon between the jaws, the upper and lower jaws respectfully having a substantially flat roof portion and flat floor portion, the said jaws each having parallel blades extending approximately vertical toward one another from the roof and the floor of the respective jaws, said blades each having a cutting edge, the outer extremity of the upper jaws having a blade with a cutting edge extending the width between its said parallel blades and downwardly at a slight inward angle to a distance beyond the width of the parallel blades of that jaw being, the joined end of the jaws attached to a handle and affixed firmly thereto, the device

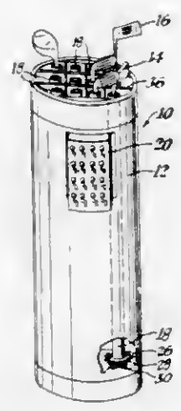
being rotatable around the circumference of the plant being treated.

4,029,135
NAIL DRIVING TOOL
George H. Searfoss, Jr., 14121 Franklin St., Woodbridge, Va. 22191
Filed Oct. 24, 1975, Ser. No. 625,872
Int. Cl.² B25C *3/00*
U.S. Cl. 145—46 16 Claims



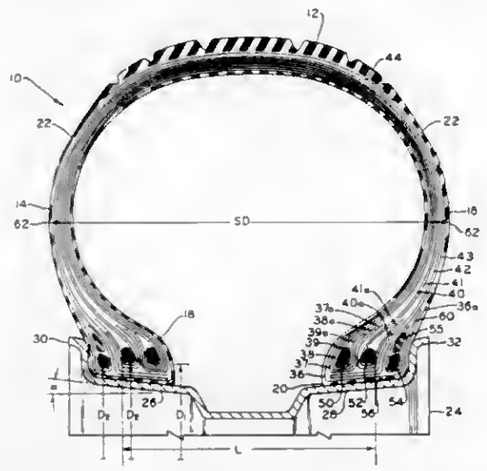
1. A nail driving tool comprising:
an elongated driving member including a rear end portion having a striking surface substantially perpendicular to the longitudinal axis of said member,
a transverse notch in said member near the forward end thereof,
an axial recess in said member rearwardly of said notch and contiguous thereto, said recess extending rearwardly along the longitudinal axis of said member,
said recess and said notch being dimensioned to receive the head of a nail,
said recess including a nail impacting surface substantially parallel to said striking surface,
a longitudinal slot in the forward portion of said member contiguous to said notch and extending to said forward end of said member,
said slot being narrower than said recess and dimensioned to receive the shank of a nail,
a nail fulcrum within said slot forwardly of said notch,
said nail fulcrum, said nail impacting surface and said striking surface being substantially collinear.

4,029,136
SELECTIVE GOLF CLUB DISPENSER
Raymond C. Jacoby, 299 SW. 7th Ave., Royal Oak Hills, Boca Raton, Fla. 33432
Filed Feb. 9, 1976, Ser. No. 656,379
Int. Cl.² A63B *55/00*
U.S. Cl. 150—1.5 R 5 Claims



1. A golf club receptacle having an individual club selector for selective positioning of a particular club within the receptacle comprising:
a golf club receptacle having an open end;
at least one individual club receiving means disposed in said receptacle;
selective club positioning means connected to said receptacle and said club receiving means for moving a particular club receiving means from a first position to a second position;
said selective club positioning means for moving said club receiving means includes a selector panel having indicia representative of individual golf clubs, and individual movement actuating means connected to said panel and said club receiving means.

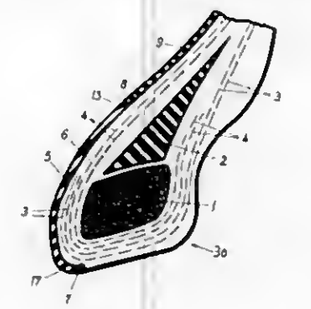
4,029,137
PNEUMATIC TIRE
Robert D. Suydam, Cuyahoga Falls, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohin
Filed Dec. 15, 1975, Ser. No. 640,596
Int. Cl.² B60C *15/04, 15/06, 9/02*
U.S. Cl. 152—362 R 6 Claims

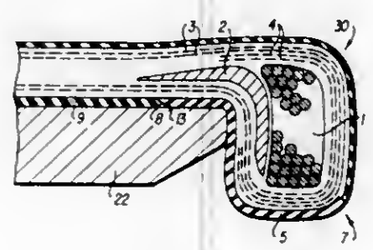


1. In an aircraft tire comprising a tread portion, a pair of sidewall portions, a pair of spaced-apart bead portions each having an axially outwardly facing flange engaging surface, a plurality of carcass plies extending circumferentially about the tire from bead portion to bead portion, and at least three inextensible bead cores disposed side-by-side in each bead portion and spaced-apart axially, the improvement comprising: at least one carcass ply wrapped around, and anchoring to said tire, each of the bead cores other than the axially outermost bead cores closest said flange engaging surfaces, the radially innermost carcass ply being wrapped around the bead cores of each bead portion and the carcass plies anchoring the bead cores other than the axially outermost bead cores, said innermost carcass ply extending from the axially outermost bead cores radially outwardly beyond the flange engaging surfaces and terminating short of the point of maximum axial width of said tire to hold the bead cores of each bead portion together and the axially outermost bead cores to said tire.

4,029,138
TIRE BLANK FOR A VEHICLE TIRE WITH TIRE BEAD PLY MEANS AND IMPROVED VEHICLE TIRE FORMED THEREFROM
Erich Kresta, Perchtoldsdorf, Austria, assignor to Semperit Aktiengesellschaft, Vienna, Austria
Division of Ser. No. 304,208, Nov. 6, 1972, Pat. No. 3,878,013. This application Jan. 20, 1975, Ser. No. 542,275
Claims priority, application Austria, Nov. 10, 1971, 9717/71
The portion of the term of this patent subsequent to Apr. 15, 1993, has been disclaimed.
Int. Cl.² B60C *15/06*
U.S. Cl. 152—362 R 14 Claims

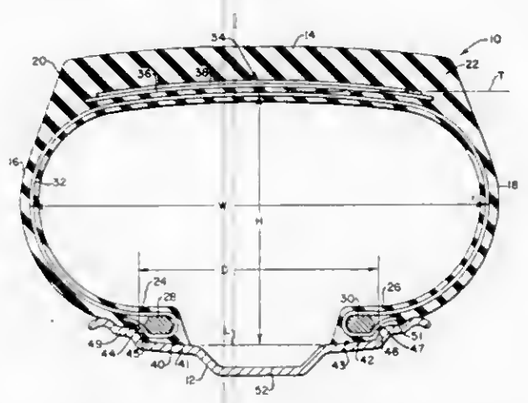
1. A tire blank for a vehicle tire comprising two tire bead portions, carcass means for interconnecting the tire bead portions, an inner plate bearing against the carcass means at the inner surface of the tire, a respective ply arranged at the inner surface of the tire at each tire bead portion, each ply being arranged to confront a tire build-up drum and being formed of a rubber mixture which is selectively harder than





either the rubber mixture employed at the other regions of the tire bead portions or the inner plate, or both, in order to reinforce confronting regions of the tire beads and to at least minimize the danger of damage at such tire bead regions during bellowless vulcanization of the tire blank.

4,029,139
TIRE AND RIM ASSEMBLY
John R. Abbott, Cuyahoga Falls, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio
Filed Jan. 5, 1976, Ser. No. 646,715
Int. Cl.² B60C *15/02*
U.S. Cl. 152—379.1 11 Claims

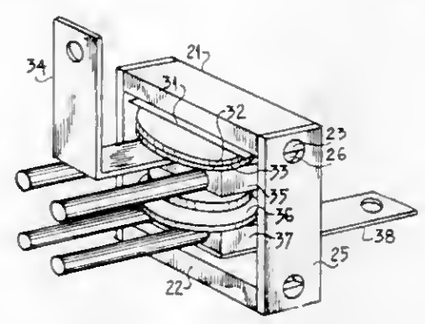


1. In a radial ply pneumatic tire and rim assembly;
a. a rim including a pair of spaced annular bead seat surfaces, a first annular register surface extending generally radially outwardly from the axially outer edge of each bead seat surface, and an annular stabilizer flange surface extending generally axially outwardly from the radially outer edge of each said first annular register surface;
b. a pneumatic tire of the open-bellied type having a tread portion, a pair of sidewall portions, a pair of axially spaced apart bead portions each having an annular inextensible bead core, a carcass structure of inextensible cords extending continuously from one bead core to the other bead core and having a neutral contour line, and a circumferentially extending belt structure disposed circumferentially about said carcass ply; and
c. a second annular register surface extending from the axially outer edge of said stabilizer flange surface and having an arcuate configuration such that the spacing between said carcass structure and the rim is substantially constant in the area of the stabilizer flange surface and is less in the area of the second bead register surface than in the area of the stabilizer flange surface.

4,029,140
METHOD OF AND MEANS FOR OBTAINING WHITE CAST IRON
William Simmons, Birmingham, England, assignor to The British Cast Iron Research Association, Birmingham, England
Filed Feb. 10, 1976, Ser. No. 656,872
Claims priority, application United Kingdom, Apr. 1, 1975, 13141/75; May 14, 1975, 20454/75
Int. Cl.² B22D *27/20*
U.S. Cl. 164—72 10 Claims

1. A method of making an iron casting containing at least a region of white iron comprising coating at least a portion of the internal surface of a mold with a material containing a white-iron-promoting material selected from the class consisting of tellurium and bismuth and compounds thereof and containing in addition a mineral substance which contains water in a loosely chemically combined form, said water being bound sufficiently tightly within said mineral substance to withstand drying heat of said mold but capable of being liberated from said mineral substance at the temperature of the molten iron, drying said coating, and pouring molten iron into said mold whereby said water is liberated to produce at least a region of white iron.

4,029,141
COOLING DEVICE FOR COMPONENTS WHICH DISSIPATE LARGE AMOUNTS OF HEAT
Alain Ferrari, and Vito Suppa, both of Paris, France, assignors to Thomson-CSF, Paris, France
Filed Dec. 15, 1975, Ser. No. 640,912
Claims priority, application France, Dec. 17, 1974, 74.41523
Int. Cl.² F28F *3/08*
U.S. Cl. 165—80 2 Claims



1. A forced flow liquid heatsink assembly for cooling electrical components which dissipate large amounts of heat, comprising in a stacked relation:
a first horizontally disposed holding cross-piece (22);
an electrical current conducting lug (38) supported upon said first cross-piece;
a first cooling device (37) supported upon said conducting lug and having defined therein a heatsink which comprises inlet (3) and outlet (4) duct means for fluidically conducting a forced flow liquid coolant into and out of a first heatsink cooling chamber (6) which has an opening (5) defined within the top portion thereof;

at least one electrical component (36) of a press-pack type supported upon said first cooling device, the base or lower surface of said electrical component closing the opening (5) of said chamber and therefore being in direct contact with the liquid coolant within said first chamber;

a second cooling devide (35) supported upon the upper surface of said first electrical component and having defined therein a heatsink which comprises inlet (3) and outlet (4) duct means for fluidically conducting a forced flow liquid coolant into and out of a second heatsink cooling chamber (6) which has an opening (5) defined within the lower portion thereof, the upper surface of said electrical component closing said opening of said chamber of said second cooling device and therefore being in direct contact with the liquid coolant within said second chamber;

a second conductive supply lug (34) operatively connected to said second cooling device;

an assembly comprising a deformably resilient metal disc (33) cooperating with a pressure disc (32) and an insulating plate (31) supported upon said supply lug for imparting a spring-type biasing force to said stacked elements;

a second horizontally disposed holding cross-piece (21) disposed in contact with and supported upon the assembly formed by said resilient and pressure discs and said insulating plate;

the two cross-pieces at the opposite ends of the thus formed stack being assembled and held together by two vertically disposed ties (24, 25);

said cross-pieces being provided with stud members integrally provided therewith and projecting laterally from the opposite ends thereof; and

said tie pieces are provided with apertures within the upper and lower ends thereof which are adapted to mate with said stud members of said cross-pieces;

whereby said tie and crosspiece members form a simple collapsible framework for said heatsink assembly with the stacked components thereof compressedly restrained between said cross-pieces, and said stud members likewise compressedly maintained within said apertures of said tie members under the biasing force of said deformable resilient metal disc.

HEAT EXCHANGER

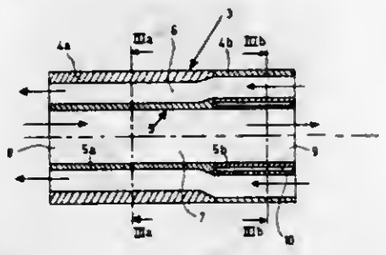
Henricus Cornelis Johannes Van Beukering, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Nov. 19, 1975, Ser. No. 633,216

Claims priority, application Netherlands, Feb. 4, 1975, 7501273

Int. Cl.² F28D *15/00*

U.S. Cl. 165—105 **3 Claims**



1. A heat exchanger, particularly suitable as a preheater for hot-gas engines, hot gas turbines and the like, comprising two series connected sections each comprising at least one hollow tubular member defining a duct through which a flue gas to be cooled can flow, a flue gas inlet connected to one end of said member in one of said sections, a flue gas outlet connected to the other end of said member in the other of said sections, at least one tube defining a duct through which a medium to be heated can flow, heat-transmitting partitions separating the flue gas duct and the medium duct, the partitions of the section the flue gas duct of which connects to the flue gas outlet being of a double-walled construction defining intermediate spaces there between, and a vaporizable heat transport medium in said intermediate spaces for isothermalizing said partitions in the flow direction during operation by way of an evaporation/condensation cycle.

POLYMERIZATION REACTOR WITH GILLED-TUBE RADIATOR AND AXIAL AGITATOR

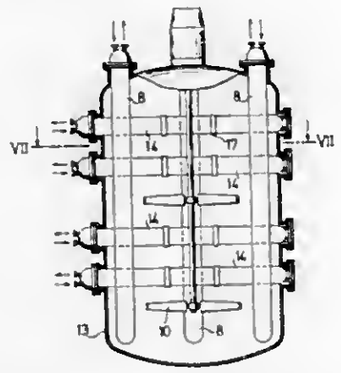
Paul Goebel, Altona, Australia, assignor to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

Filed Aug. 27, 1975, Ser. No. 608,258

Claims priority, application Germany, Aug. 29, 1974, 2441302; Feb. 6, 1975, 2504926

Int. Cl.² F28F *13/12*

U.S. Cl. 165—109 **4 Claims**



1. A polymerization reactor comprising, in combination, a hollow reaction vessel having top, bottom and side walls, axial agitator means for circulating polymerization products in the reactor along a flow path which ascends along said side walls from said bottom wall to said top wall and descends from said top wall towards said bottom wall in the central portion of the reaction vessel, and a plurality of separate internal cooling units mounted on the top wall of said vessel in a predetermined, uniform array near the side walls of the vessel and extending downwardly from said top wall towards said bottom wall, each of said cooling units including a header mounted on said top wall, defining separate inlet and outlet chambers, a plurality of hollow generally U-shaped heat transfer tubes each of which has a pair of generally parallely extending legs respectively connected in communication with said inlet and outlet chambers and a bight portion connecting the legs and being located near said bottom wall, a plurality of separate metal plates connecting the legs of said tubes to each other and to the legs of other tubes in the unit and to other plates, said plates maintaining a predetermined spacing between said tubes and interrupting flow about said tubes to enhance mixing and cooling, and a plurality of cooling units mounted on the side wall of the vessel and extending horizontally through said vessel transversely to the vertically extending cooling units.

4,029,144

HEAT EXCHANGER ASSEMBLIES

Peter John Harris, Birmingham, England, assignor to GKN Birwelco Limited, Birmingham, England

Filed Dec. 6, 1974, Ser. No. 530,387

Claims priority, application United Kingdom, Dec. 8, 1973, 57002/73

Int. Cl.² F28B *1/06*

U.S. Cl. 165—124 **8 Claims**

1. A cooling tower assembly, comprising a tower having a chimney part and apertured support means between the lower end of the chimney part and the ground, and a heat-exchanger assembly within the lower part of the tower and spaced above the ground, the plan area of the lower part of the tower being bounded by a curved outer periphery, the heat exchanger assembly comprising a plurality of finned tubes, the tubes being grouped together in banks, each bank comprising a plurality of parallel tubes arranged side by side with their ends received in headers, the banks being arranged in side-by-side pairs so that each pair forms a V-frame or A-frame with the banks diverging upwardly or downwardly from the apex of the V or A and with the tubes of each bank having their longitudinal axes running parallel to the apex of the frame, wherein the apex of each frame lies in a plane of a set of parallel planes, and wherein the banks of which the heat exchanger assembly is essentially comprised are of different lengths but are otherwise substantially identical, such banks being arranged within said plan area to fill a major part thereof and so that the outer periphery of the plan area of the heat exchanger assembly is bounded by two sets of parallel lines, the lines of one set being perpendicular to the lines of the other set, each set having at least six lines, the support means and the heat exchanger assembly being arranged so that air can pass through the support means and through the heat exchanger assembly from beneath the assembly into the tower.

4,029,145

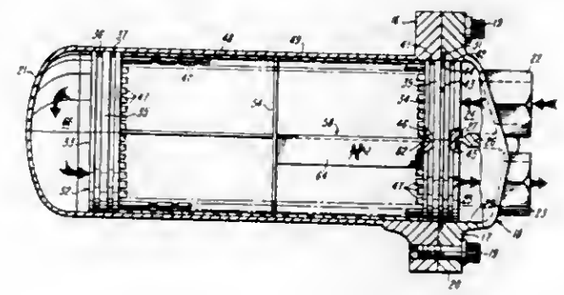
BRAZELESS HEAT EXCHANGER OF THE TUBE AND SHELL TYPE

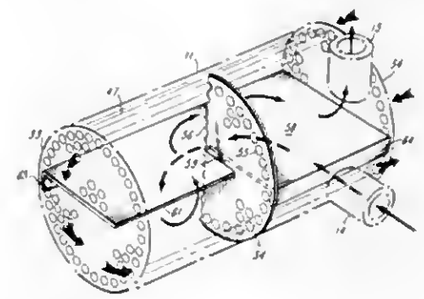
Robert R. Pfouts, Dayton; Thomas E. Earl, and Charles B. Mort, both of Findlay, all of Ohio, assignors to United Aircraft Products, Inc., Dayton, Ohio

Filed Mar. 5, 1976, Ser. No. 664,397

Int. Cl.² F28F *9/22*

U.S. Cl. 165—161 **12 Claims**





1. A brazeless heat exchanger of the tube and shell type, including

a. a tubular shell,

b. spaced apart apertured headers in said shell,

c. resilient O-ring means in peripherally encircling relation to said headers and in a sealing contacting relation to an inner wall of said shell,

d. heat exchange tubes positioning longitudinally in said shell and having their ends received in apertures in said headers,

e. said tubes forming a tube assembly peripherally spaced from the said inner wall of said shell to be substantially unsupported thereby and said tube assembly and said headers forming a core unit,

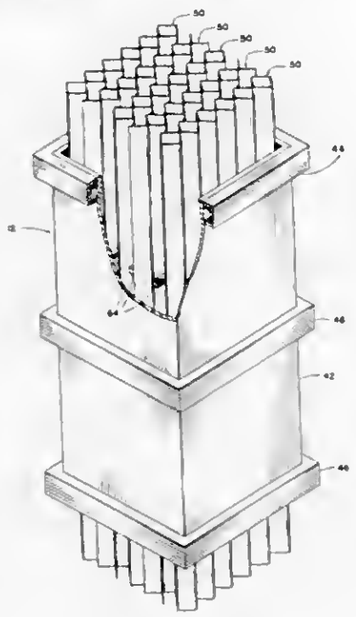
f. a seal by-pass member in an encircling relation to said tube assembly and occupying the space between said tube assembly and the said inner wall of said shell in substantially mutually contacting relation to said inner wall and to at least some of the peripherally positioning tubes of the tube assembly,

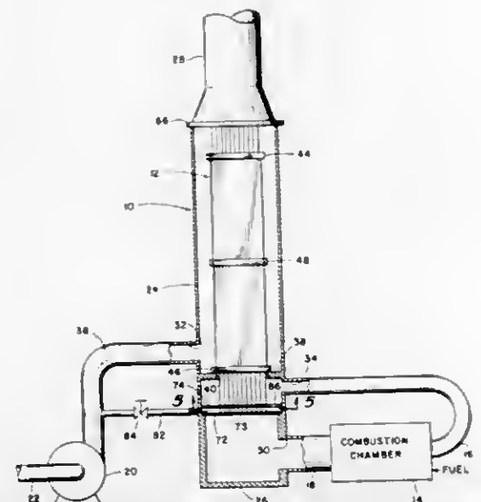
g. said seal by-pass member being made of a flexible yielding material cooperating with said O-ring means in a cushioning of the core unit, inlet and outlet ports in said shell for a first fluid and positioning between said headers whereby said first fluid entering said shell by way of said inlet port may flow over and around said tubes and exit by way of said outlet port, said O-ring means inhibiting the escape of said first fluid over the periphery of said headers and said seal by-pass member inhibiting by-passing flow of said first fluid around said tube assembly,

j. and baffle means installed in said core unit anchoring said seal bypass member to said core unit and guiding said first fluid in its flow between said inlet and said outlet for advantageous use of available heat transfer surface in said tube assembly,

k. another fluid flowing through said tubes and being in heat transfer relation through the tube walls with said first fluid.

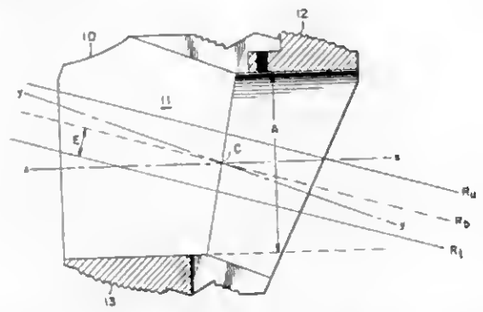
4,029,146
CORRUGATED SHEET HEAT EXCHANGER
Wallace F. Hart, and Ralph A. Koenig, both of Tulsa, Okla., assignors to John Zink Company, Tulsa, Okla.
Continuation of Ser. No. 457,065, April 1, 1974, abandoned. This application July 18, 1975, Ser. No. 596,984
Int. Cl.² F28F 3/08
U.S. Cl. 165—166 6 Claims





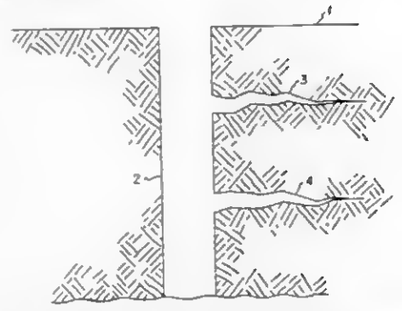
1. A counter-flow heat exchanger for effecting heat transfer between longitudinally flowing first low pressure gas of one temperature and second, relatively higher pressure gases at another temperature comprising:
a longitudinal rectangular elongated housing;
a plurality of elongated fluid channel units disposed within the housing and extending beyond the ends of said housing, each said channel unit comprising spaced first pair and a second pair of elongated corrugated plates, each of said plates corrugated transversely to said elongated housing in an oscillatory wave pattern having symmetrical peaks and valleys of constant period, the plates of each pair positioned so that the peaks of one plate unconnectably abut the peaks of the other to create a plurality of distinct longitudinal straight flow passageways through the space created between said valleys for said first gas, said first pair of plates being spaced from said second pair of plates by straight transverse separator rods and said first pair of plates displaced from said second pair of plates 180 degrees out of phase with said wave pattern to create longitudinal counter flow channels on each side of each pair for said second gas;
a tube sheet secured at each end of said channel units closing the ends of said longitudinal flow channels and having a plurality of apertures therethrough to permit inlet and outlet of said first gas through said flow passageways;
an annular inlet housing means to communicate said second gas with the space between one of said tube sheets and one end of said elongated housing, and to flow said second gas through said longitudinal flow channels; and
an annular outlet housing means between the other of said tube sheets and the other end of said elongated housing from which said second gas is withdrawn.

4,029,147
GRIPPING MEMBER FOR WELL PACKER
Marion Barney Jett, Dallas, Tex., assignor to Dresser Industries, Inc., Dallas, Tex.
Filed Oct. 23, 1975, Ser. No. 625,355
Int. Cl.² E21B 23/00
U.S. Cl. 166—217 5 Claims



1. A unitary tubular gripping member having an intersecting-axis bore passage therethrough and exterior gripping means thereon, said gripping means further comprising a plurality of angular teeth having a curved tooth profile, with said teeth having varying face angles according to their angular displacement from the axis intersection of said bore passage.

4,029,148
WELL FRACTURING METHOD
Leonard W. Emery, Plano, Tex., assignor to Atlantic Richfield Company, Los Angeles, Calif.
Filed Sept. 13, 1976, Ser. No. 722,452
Int. Cl.² E21B 43/26, 47/10
U.S. Cl. 166—254 4 Claims



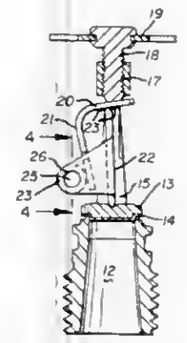
1. In a well fracturing method wherein a plurality of solid particles are employed as propping agent, the improvement comprising the employing color-coded propping agent particles so that if propping particles are subsequently produced out of one or more propped fractures the recovery of such propping particles at the earth's surface gives an indication because of said color-coding as to the nature of the problem in the fractured area.

4,029,149
PROPPING SUBTERRANEAN FORMATION FRACTURES
Larry F. Perkins, Duncan Falls, Ohio, assignor to Halliburton Company, Duncan, Okla.
Filed July 11, 1975, Ser. No. 594,994
Int. Cl.² E21B 43/26
U.S. Cl. 166—280 9 Claims

1. A method of fracture stimulating a subterranean formation penetrated by a well bore comprising the steps of:

a. introducing a highly viscous fluid into said formation at a rate sufficient to create and extend one or more fractures therein;
b. introducing at least one slug of a hardenable liquid into said formation;
c. introducing additional highly visous fluid into said formation so that said slug of hardenable liquid is carried into and held in said fractures in said formation;
d. terminating the introducing of said highly viscous fluid so that said fractures are held open while said slug of hardenable liquid is permitted to set thereby propping said fractures; and
e. recovering said highly viscous fluid from said formation.

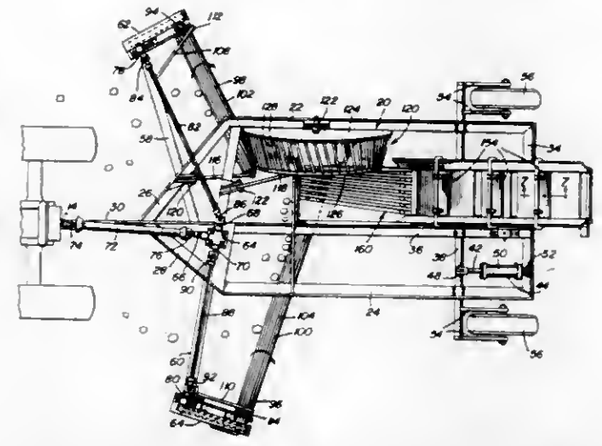
4,029,150
SPRINKLER
Earl M. Goodsell, Jr., Hudson, Ohio, assignor to A-T-O Inc., Willoughby, Ohio
Filed Mar. 5, 1976, Ser. No. 664,187
Int. Cl.² A62C 37/08
U.S. Cl. 169—39 7 Claims



1. A sprinkler comprising a body member having a fluid delivery passageway therethrough, oppositely disposed arms on said body member forming a frame outwardly of said fluid passageway and joined at their outer ends, a compression fitting positioned through a secondary passageway in said joined arms on the axial center line of said fluid delivery passageway, a deflector on said compression fitting and a closure on said fluid delivery passageway, an assembly comprising an inverted L-shaped lever having a substantially horizontal portion and a substantially vertical portion and a straight strut, said assembly positioned between and in engagement with said compression fitting and closure and normally retaining said closure on said fluid delivery passageway, said straight strut being positioned substantially on said axial center line, a pair of spaced oppositely disposed sidewardly extending apertured arms on said straight strut and a horizontally disposed fusible material retaining means positioned between said apertured arms and partially engaged in the apertures therein, said substantially vertical portion of said inverted L-shaped lever being normally positioned between said apertured arms and spaced therefrom and between said straight strut and said fusible material retaining means and in engagement with said fusible material retaining means, said fusible material retaining means normally preventing relative motion of said lever with respect to said strut in said assembly and acting to free said lever from said strut upon attainment of a predetermined temperature.

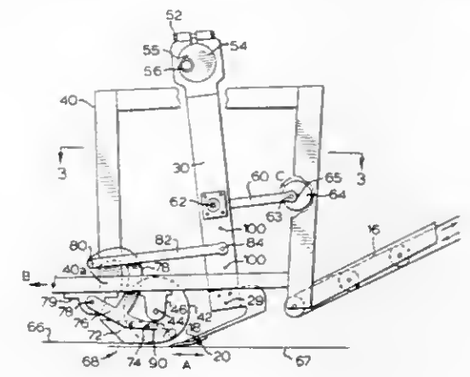
4,029,151
STONE GATHERER WITH DISCHARGE CONVEYOR
Herbert Hehr, Rte. 1, Fredonia, N. Dak. 58440
Filed Jan. 16, 1976, Ser. No. 649,793
Int. Cl.² A01B 43/00
U.S. Cl. 171—65 12 Claims

1. A stone gatherer including a main frame, a hollow generally truncated cone-shaped wheel journaled from said frame for rolling along the ground surface over which said frame is advanced, the major and minor diameter axial ends of said wheel being closed and open, respectively, means supported from said frame for engagement with and laterally deflecting windrowed stones along which said frame is advanced into said open minor diameter end of said wheel, the axis of rotation of said wheel lying in a substantially vertical plane generally normal to the direction of intended movement of said frame and said axis being inclined relative to the horizontal an amount substantially equal to the angle of displacement of the slant height of the wheel relative to the wheel center axis with the lowermost slant height of the wheel horizontally disposed, a rotary disk, support means journaling said disk from said



main frame for rotation about an axis generally paralleling the axis of rotation of said wheel and with said disk disposed closely outwardly of and closing the rear lower quadrant portion of the open minor diameter end of said wheel said wheel including circumferentially spaced lift members disposed about and supported from outer peripheral portions of the interior of the wheel for engaging rocks received into the lower periphery of the open minor diameter axial end of said wheel and elevating the engaged rocks upon rotation of said wheel, said support means including means mounting said disk for limited axial shifting along its axis of rotation, and means yieldingly biasing said disk toward its limit position of shifting toward said wheel.

4,029,152
SOD CUTTING MACHINE WITH OPPOSITELY RECIPROCATING UNDERCUTTING AND SIDE CUTTING KNIVES
Theodorus Petrus Hubertus Gerrits, Newmarket, Canada, assignor to Brouwer Turf Equipment Limited, Keswick, Canada
Filed Oct. 1, 1975, Ser. No. 618,593
Int. Cl.² A01B 45/04
U.S. Cl. 172—19 6 Claims



3. In a sod cutting machine adapted for travel forwardly along a path of travel to cut a strip of sod, improved means for

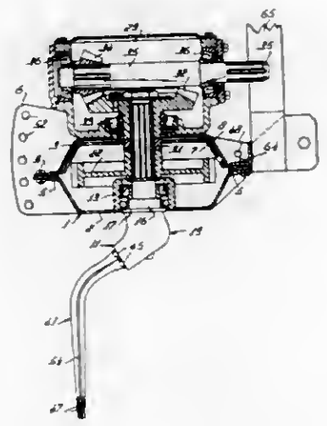
cutting beneath said strip and for cutting the edges of said strip, comprising:

a. a frame,
b. an undercutting blade,
c. a pair of first support arms one connected to each side of said undercutting blade and supporting said undercutting blade in an orientation in which said undercutting blade extends across said path of travel, for cutting beneath said strip,
d. means pivotally connecting said first support arms to said frame for reciprocation of said undercutting blade in a direction having a horizontal component parallel to said path of travel,
e. a pair of side cutting blades,
f. a pair of second support arms one connected to each of said side cutting blades and supporting said side cutting blades in vertical planes parallel to said path of travel and substantially aligned with the outer edges of said undercutting blade for cutting the edges of said strip,
g. means pivotally connecting said second support arms to said frame for reciprocation of said side cutting blades in a direction having a substantial vertical component and having a horizontal component parallel to said path of travel,
h. a single rotary power source mounted on said frame for providing power to reciprocate said first and second arms,
i. and a mechanical linkage connecting said power source to said first and second arms for reciprocating said undercutting blade and said side cutting blades oppositely in continual mechanical synchronization, so that said side cutting blades move forwardly when said undercutting blade moves rearwardly and so that said side cutting blades move rearwardly when said undercutting blade moves forwardly.

4,029,153
ROTARY HARROWS

Cornelis van der Lely, 7 Bruschenrain, Zug, Switzerland

Filed Mar. 6, 1975, Ser. No. 556,149
Claims priority, application Netherlands, Mar. 7, 1974, 7403070
Int. Cl.² A01B 33/06
U.S. Cl. 172—59 7 Claims

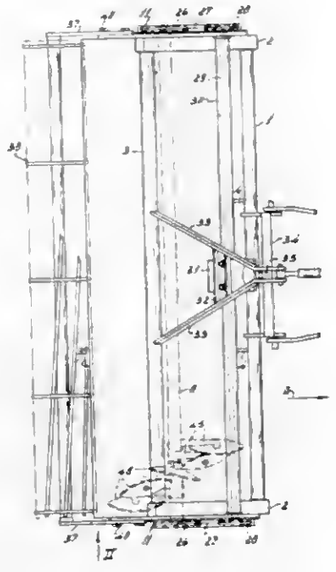


1. A rotary harrow comprising a frame having an elongated frame portion that extends transverse to the direction of travel, a plurality of soil working members being mounted on corresponding upwardly extending shafts and said shafts being journalled in said frame portion, said frame portion being hollow and having opposing upper and lower shaped portions that are substantially identical in cross-section configuration, said upper and lower portions having outer rims that adjoin one another substantially midway between a top and bottom of said frame portion that are defined by the bases of said upper and lower portions respectively, said shafts being connected to driving means housed within said frame portion, said driving means including corresponding pinions on said shafts and said pinions having teeth in mesh with one another, the teeth of said pinions being located at substantially the same level as said rims of the upper and lower portions of said frame portions.

4,029,154
SOIL CULTIVATING MACHINES

Cornelis van der Lely, 7, Bruschenrain, Zug, Switzerland

Filed Oct. 15, 1975, Ser. No. 622,451
Claims priority, application Netherlands, Oct. 15, 1974, 7413513
Int. Cl.² A01B 33/02, 33/14, 35/27
U.S. Cl. 172—91 12 Claims

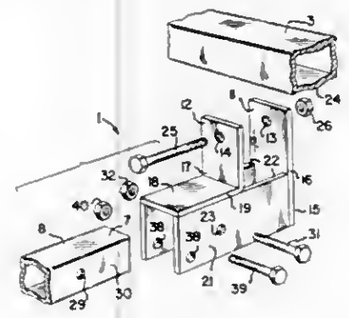


1. A soil cultivating machine comprising a frame and a driven soil cultivating member comprising support means, that is rotatable about a substantially horizontal axis of rotation that extends transverse to the normal direction of travel, a plurality of disc-shaped soil cultivating means connected to said support means and positioned around said axis of rotation, said cultivating means each being freely rotatable about a corresponding further axis of rotation spaced from said first mentioned axis of rotation, said further axis being non-perpendicularly inclined to a plane containing said horizontal axis of rotation, said cultivating means being mounted on arms that extend outwardly from said support means and said arms being arranged on a bracket connected to said support means, said arms being angularly spaced apart from one another around the axis of rotation of said support means and a plurality of brackets with corresponding cultivating means being mounted along the length thereof, the last arm on one of said brackets being angularly spaced around said support means from a first arm on an adjacent bracket, said arms extending from said support means and being arranged in at least one helical row, the outer ends of said arms carrying stub shafts and said stub shafts having longitudinal axes that define said further axes of rotation, successive soil cultivating means, considered lengthwise along said rotary support means, being inclined alternately forwardly and rearwardly relative to the normal operative direction of rotation of said cultivating member from the planes that contain said horizontal axes.

4,029,155
FLOATING MOUNT FOR AGRICULTURAL FINISH TOOLS

Calvin B. Blair, Barnard; Lee J. Brinker, Glen Elder, and Thomas W. Ankenman, Tipton, all of Kans., assignors to Kent Manufacturing Co. Inc., Tipton, Kans.

Filed June 23, 1975, Ser. No. 589,124
Int. Cl.² A01B 23/04, 49/02
U.S. Cl. 172—763 6 Claims



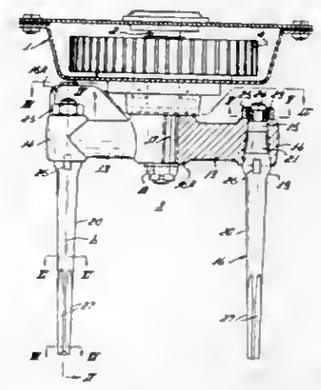
1. In combination, a transverse draw frame bar, a trailing tillage tool support member, and a mounting device attaching a forward end of said tool support member to said draw frame bar; said mounting device comprising:

a. means pivotally attaching said tool support member to said draw frame bar for limited pivotal movement thereof with respect to said bar in a substantially vertical and rearwardly projecting plane; said pivotal attaching means being disposed normally below said draw frame bar and including:
   1. a top panel having an upper surface, a lower surface, and a rearward end;
   2. first and second side panels depending from and connected with said top panel; said side panels being substantially parallel and spaced apart; said tool support member being disposed longitudinally between said side panels;
   3. means pivotally connecting said support member with said side panels at a point on said support member spaced rearwardly and apart from the forward end thereof; the forward end of said tool support member, when pivoted in one direction a sufficient distance, engaging a surface generally in the plane of the lower surface of said top panel, thus forming a first stop to limit said pivotal movement in one direction;
   4. said tool support member having an upper surface area thereof disposed rearwardly of said point of pivot; said support member upper surface area engaging the lower surface of said top panel at a point thereon disposed adjacent to the rearward end thereof, when said forward end of said support member is pivoted a sufficient distance in the other direction, thus forming a second stop, the pivotal movement of said support member being limited in the other direction upon sufficient pivotal movement in said other direction, said pivotal movement being limited between said first and second stops to an acute angle;
b. clamping means securing said mounting device to said draw frame bar and including:
   1. an upstanding front plate having an aperture adjacent an upper free edge thereof, and a lower edge thereof connected with a forward end of said mounting device, so as to be fixed with respect to said top panel;
   2. an upstanding rear plate having an aperture adjacent an upper free edge thereof and a lower edge thereof connected with said top panel; said rear plate aperture being aligned with said front plate aperture;
   3. said front and rear plates being spaced apart to closely receive therebetween said frame bar; and
   4. means received in said front and rear plate apertures and urging the same tightly into frictional engagement respectively with leading and trailing surfaces of said draw frame bar.

4,029,156
SOIL WORKING TINES

Cornelis van der Lely, 7, Bruschenrain, Zug, Switzerland

Filed Jan. 29, 1975, Ser. No. 545,005
Claims priority, application Netherlands, Jan. 31, 1974, 7401322
Int. Cl.² A01B 33/06
U.S. Cl. 172—765 9 Claims



1. A tine for a rotary harrow and adapted for movement in a circular path through the soil, comprising a longitudinal upper fastening portion with a substantially circular cross section and an upper end, an elongated lower soil working portion being integral with the fastening portion at a junction and lugs being located diametrically opposite to one another adjacent said junction, each of said portions having longitudinal axes and these axes extending generally in the same direction as one another, said fastening portion tapering inwardly from said junction towards said upper end, said soil working portion having a generally oval cross-section region for part of its length below said junction and said oval cross-section region progressively merging into a substantially polygonal cross-section region towards a lower free end, the cross-section of said free end being substantially rectangular and grooves extending upwardly from said free end, said grooves being generally parallel to the longitudinal axis of said soil working portion, said grooves being located between corners of said polygonal region, said oval region and polygonal region each having perpendicular diagonals of different lengths and the longer diagonals of said regions being in alignment with one another and fixable to extend in the same direction as said circular path during operation.

4,029,157
MATERIAL PUSHING VEHICLE HAVING PIVOTAL BLADE PORTION

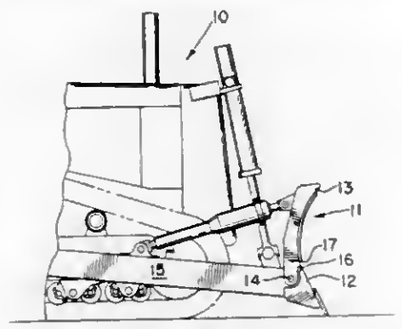
Gary P. Freese, Joliet, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.

Filed May 28, 1976, Ser. No. 691,123
Int. Cl.² E02F 3/76
U.S. Cl. 172—801 4 Claims

1. In a work vehicle of the material pushing type having a material pushing blade fixed to the vehicle, the improvement comprising:

a push arm assembly having an opening and being connected to the vehicle;
said blade having first and second generally horizontally extending portions each having faces of a construction sufficient for contacting and pushing material, said first blade portion being connected to the push arm assembly;
means for pivotally connecting the blade portions one to the other for pivotal movement of the second blade portion between a first position at which the faces of the blade portions define an arc of preselected configuration and a

second position at which portions of the second blade portion face are spaced from said first position in response to forces subjected upon said second blade por-



tion, said means including a pin extending through the opening of the push arm assembly; and

means for urging the second portion of the blade toward the first position.

4,029,158

PILE DRIVING APPARATUS

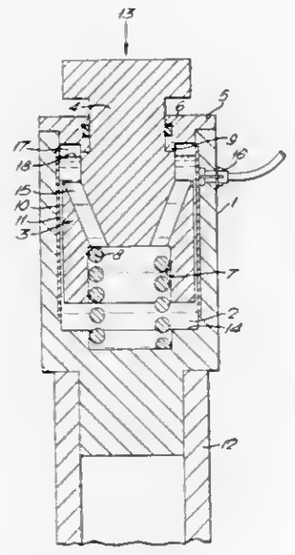
Arthur Gerrish, Burgess Hill, England, assignor to Laser Engineering Development Ltd., London, England

Filed Aug. 4, 1975, Ser. No. 601,433

Claims priority, application United Kingdom, Aug. 9, 1974, 35192/74

Int. Cl.² E02D *11/00*

U.S. Cl. 173—131 **11 Claims**



1. Pile driving apparatus comprising a housing including an elongate enclosed chamber containing an electro viscous fluid, the housing being adapted to be mounted on the upper end of a pile to be driven with the chamber longitudinally orientated in the direction in which the pile is to be driven; and means for simultaneously transmitting, to a pile to be driven, a linear force produced by a hammer blow and a vibrating force which is generated by the application of the hammer blow, said means comprising a transfer hammer having a part which slidingly extends into the chamber through the housing for transmitting the linear force produced by a hammer blow applied to the transfer hammer to the pile to be driven by movement of said part of the transfer hammer into the chamber along the length of the chamber, and means for developing a vibratory force when the said part of the transfer hammer moves along the chamber as a result of a hammer blow, said means comprising a gap containing said electro viscous fluid surrounding the said part of the transfer hammer between said part of the transfer hammer and the walls of the chamber and means for applying an alternating electrical field across the gap.

4,029,159

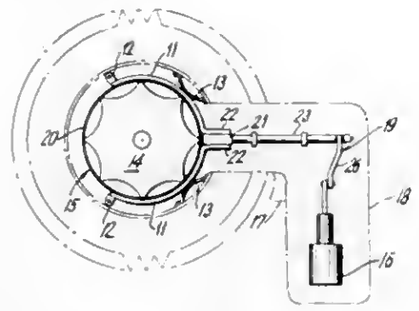
BRAKE CONTROL FOR ROTARY ELECTRIC TOOLS

Svend Nymann, 68 E. Hartsdale Ave., Hartsdale, N.Y. 10530

Continuation-in-part of Ser. No. 476,474, June 5, 1974, abandoned. This application Sept. 22, 1975, Ser. No. 615,358

Int. Cl.² E21B *3/00*

U.S. Cl. 173—163 **6 Claims**



1. In a rotary tool having a motor with a rotating armature and a brake drum mounted thereabout, a brake control device comprising:

a pair of curved brake shoes pivotably mounted at one end about the brake drum and each brake shoe having a projecting portion extending outwardly from the armature and in a substantially parallel spaced relation,

spring means normally biasing the brake shoes into engagement with the brake drum, said means comprising a separate leaf spring engaging each brake spring,

a cam element mounted between the projecting portions of the break shoes,

a solenoid fixedly mounted within the tool,

a linkage connected at one end to the solenoid and connected at the other end to an end portion of the cam element, and

means for activating the solenoid and the motor wherein the solenoid actuates the cam element to cam the projecting portions of the brake shoes outwardly against the bias of the spring means thereby releasing the brake drum and associated armature and wherein the armature is immediately halted when the solenoid is deactivated by camming the brake shoes into engagment with the brake drum under urging of the spring means.

DRILLING MACHINE

Gustav Martin Leidvik, Bromma, Sweden, assignor to Stabilator AB, Bromma, Sweden

Filed Sept. 8, 1975, Ser. No. 611,421

Claims priority, application Sweden, Sept. 16, 1974, 7411647

Int. Cl.² E21C *7/02, 7/12*

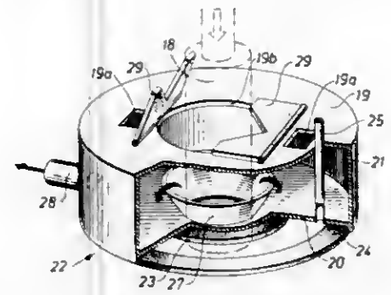
U.S. Cl. 175—210 **11 Claims**

1. A drilling machine for drilling holes in structural building elements, such as concrete floors or walls, comprising

a. a frame structure (2, 3) in which a drilling bar (18) having a cutting bit is displaceably mounted for movement relative to the structural element;

b. a container (22) which at least partially surrounds said drilling bar (18) and which is adapted to collect the cooling liquid used to cool said cutting bit of said drilling bar and to collect the slurry formed during a drilling operation, said container (22) including a bottom plate (20) arranged to face towards the structural element and having a circular opening (20*a*) which receives said drilling bar (18);

c. a collar (27) arranged in said opening (20*a*) having an inner surface for blocking the cooling liquid and slurry mixture thrown off by said drilling bar, said collar further having an upper edge over which the mixture is fed to the



interior of said container (22) to form a substantially stationary reservoir therein; and

d. an outlet (28) in said container (22) for draining the reservoir from said container (22).

4,029,161

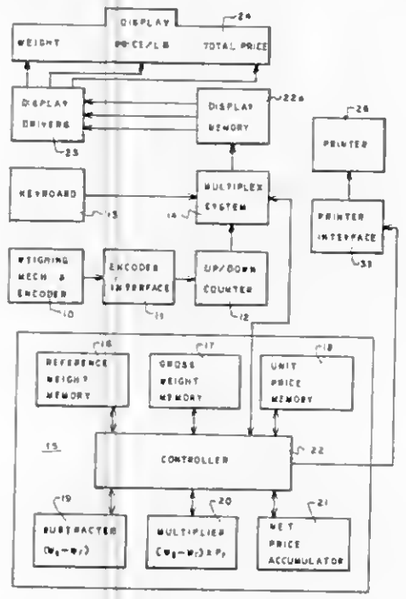
DIGITAL SCALE

Colin E. Foster, Bensenville, and Edward C. Karp, Belvidere, both of Ill., assignors to Sanitary Scale Company, Belvidere, Ill.

Continuation-in-part of Ser. No. 564,416, April 2, 1975, abandoned. This application Sept. 4, 1975, Ser. No. 610,170

Int. Cl.² G01G *19/413, 23/18*

U.S. Cl. 177—25 **33 Claims**



1. A weighing and computing system of the type which determines a net weight and net price for each commodiy in a series of commodities to be weighed and a total net price for the entire series of commodities, said system comprising:

a weighing mechanism including a platform upon which commodities to be weighed are placed for providing reference and gross weight signals responsive to the load on said platform;

unit price means selectively operable for providing a read signal corresponding to a unit weight price for each commodity to be weighed;

reference weight memory means for storing said reference weight signals developed by said weighing mechanism, said reference weight signals corresponding to the total load on the platform immediately prior to the weighing of the next commodity in the series;

gross weight memory means responsive to said gross weight signals developed by said weighing mechanism for storing said gross weight signals, said gross weight signals corresponding to said reference weight plus the weight of the next commodity in the series placed on said platform;

means for determining the difference between said gross weight signals and said reference weight signals to provide a net weight for said next commodity in the series of commodities;

means for multiplying said net weight by said rate signal for providing a net price for each of said commodities in the series:

net price accumulating means for accumulating said net prices; and

display means coupled to said net price accumulating means for displaying the sum total of said net prices.

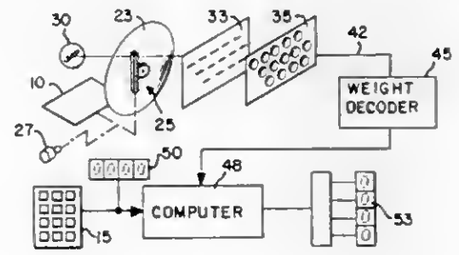
ZERO RETURN TARE GUARD

James J. Krolick, deceased, late of Dayton, Ohio, by Arline Krolick, executrix, and Edwin E. Boshinski, Dayton, Ohio, assignors to Hobart Corporation, Troy, Ohio

Filed Oct. 15, 1975, Ser. No. 622,723

Int. Cl.² G01G *23/14*

U.S. Cl. 177—165 **10 Claims**



1. In a system for weighing a load in a container, the combination comprising:

a weighing mechanism adapted to determine the difference between the weight of a load applied thereto and the tare weight of the load container,

tare adjusting means for entering said tare weight into said weighing mechanism,

manually operable means for controlling said tare adjusting means,

signal means for producing a tare warning indication,

first sensing means for determining when said manually operable means is manually touched, and second sensing means for determining when said manually operable means changes the tare weight, and

control circuit means, responsive to said first and second sensing means, for causing said signal means to produce a warning indication when said manually operable means is manually touched while said weighing mechanism has a substantial load supplied thereto, and for terminating said tare warning indication when said manually operable means changes said tare weight while said weighing mechanism does not have a substantial load applied thereto.

4,029,163

WEIGHING APPARATUS

Clifford Edwin Allen, Cwmbran, Great Britain, assignor to Isca Electronics Limited, Newport, Great Britain

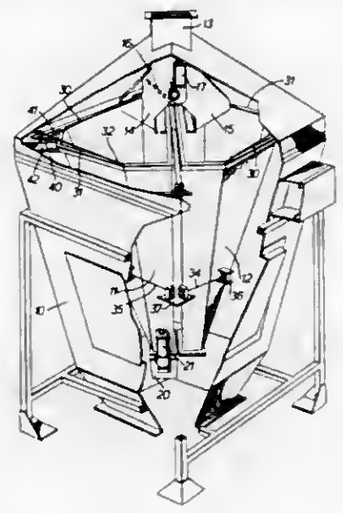
Division of Ser. No. 593,029, July 3, 1975, Pat. No. 3,966,000, which is a division of Ser. No. 490,261, July 22, 1974, abandoned. This application May 28, 1976, Ser. No. 690,981

Int. Cl.² G01G *21/24*

U.S. Cl. 177—255 **7 Claims**

1. Apparatus for weighing materials, comprising a hopper with an inlet opening at its upper end, and a controlled outlet opening at its lower end, means for supporting said hopper to permit limited vertical movement thereof, comprising an upper flexible tension element extending horizontally in one direction from a point on the hopper adjacent the upper end

thereof, to a fixed point at the same level, and a lower flexible tension element extending horizontally in another generally opposite direction from a point on the hopper adjacent the



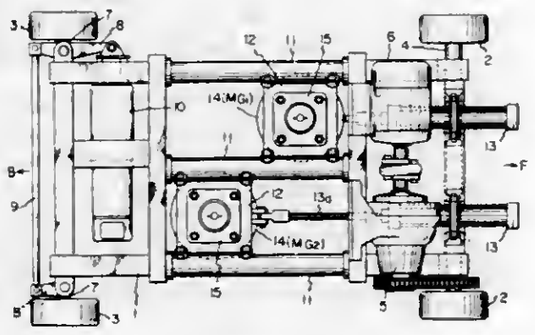
lower end thereof to a fixed point at the same level, and an electro-mechanical transducer for sensing the weight of the hopper, situated at a position offset laterally from a vertical line through the centre of the hopper.

4,029,164

MOVABLE APPARATUS ADHERING TO THE SURFACE OF A WALL

Fukashi Urakami, Fukuoka, Japan, assignor to Sanko Co., Ltd., Fukuoka, Japan

Filed Dec. 22, 1975, Ser. No. 643,398
Claims priority, application Japan, Dec. 28, 1974, 50-50315
Int. Cl.² B62D *63/02*; **B60S** *3/02*
U.S. Cl. 180—1 VS **14 Claims**



1. Apparatus movably adhering to an upright wall comprising a body, driven wheels mounted on said body adapting said body to travel along said wall, wall-adhering devices selectively operable to an adhering condition or a releasing condition, operable means for extending and retracting said wall-adhering devices relative to said body in a direction generally perpendicular to said wall, and actuating means movably mounting said wall-adhering devices on said body for movement in the general traveling direction of said body, whereby said body in the direction of travel travels along said wall on said driven wheels as one wall-adhering device in its adhering and extending condition adheres to said wall and another wall-adhering device while in its released and retracted condition is moved relative to said body in the direction of travel by said actuating means.

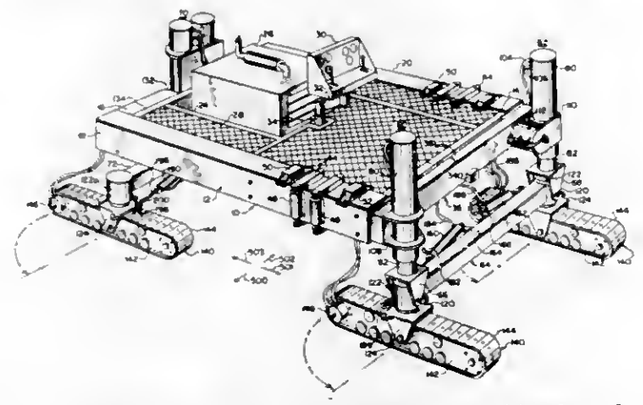
CONVERTIBLE CONSTRUCTION MACHINE

David J. Miller, and Charles P. Miller, both of McHenry, Ill., assignors to Miller Formless Co., Inc., McHenry, Ill.

Filed Feb. 5, 1976, Ser. No. 655,389
Int. Cl.² B62D *11/04*, *11/20*
U.S. Cl. 180—6.48 **33 Claims**



1. In a mobile construction machine the combination of:
a main frame adapted to carry a working tool;
a pair of vertically adjustable main frame support means spaced along one side of said main frame;
a first walking beam extending along said one side of said main frame and pivotally mounted to each said main frame support means;
one of said main frame support means being pivotally mounted to said main frame and a horizontal axis above and in substantially the same plane as its respective pivotal mount on said first walking beam;
a second vertically adjustable main frame support means on the other side of said main frame;
a second walking beam extending along said other side of said main frame;
said second main frame support means being pivotally mounted on an axis transverse and substantially central of the longitudinal axis of said second walking beam; and
ground engagement means adapted to transport said machine pivotally mounted on means defining individual vertical steering axes at the ends of each of said walking beams to steer said machine.

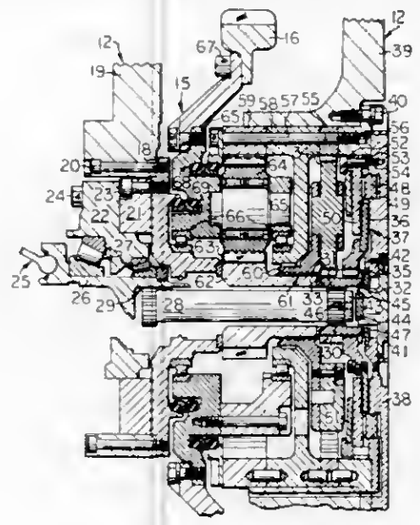
4,029,166

FINAL SPROCKET DRIVE FOR TRACK-TYPE VEHICLES

Willard J. Haak, Peoria; Howard A. Marsden, Pekin, and Rollin P. Van Zandt, Peoria, all of Ill., assignors to Caterpillar Tractor Co., Peoria, Ill.

Filed May 13, 1975, Ser. No. 577,135
Int. Cl.² B62D *55/12*
U.S. Cl. 180—9.62 **20 Claims**

1. In a track-type vehicle of the type having a main frame, a sub-frame mounted on each side of said main frame and an endless track assembly mounted on said sub-frame, said sub-frame solely mounted on said main frame by resilient mounting means operatively interconnected between said main frame and said sub-frame and disposed forwardly of said sprocket towards a forward end of said vehicle for permitting independent movement of said sub-frame relative to said main frame, a sprocket rotatably mounted on said sub-frame and operatively engaged with said track assembly for selectively driving the same and a final drive means operatively connected to said sprocket for selectively rotating the same, said final drive means comprising at least one planetary gear set mounted on said sub-frame and having an annular carrier



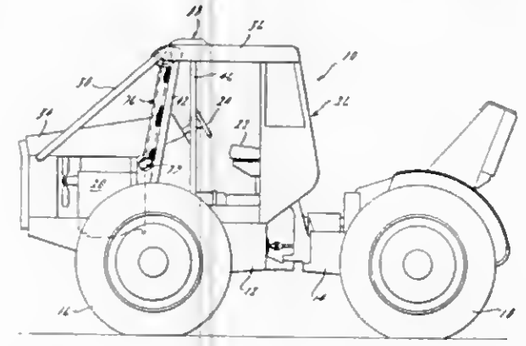
thereof rotatably mounted on said sub-frame and attached directly to said sprocket for rotation therewith.

4,029,167

EXHAUST SYSTEM

Anthony E. Fox, Ann Arbor, and Marcello Bargellini, Westland, both of Mich., assignors to Massey-Ferguson Inc., Detroit, Mich.

Filed Apr. 11, 1975, Ser. No. 567,209
Int. Cl.² B60K *13/04*
U.S. Cl. 180—64 A **9 Claims**



1. An exhaust system for a mobile vehicle having a wheel supported main frame and an operator station, the combination of; a protective frame structure for said operator station including longitudinally extending side frame members supported in elevated position relative to said main frame above said operator station, an elongated housing extending transversely between and to the front of said side frame members and being rigidly connected thereto, a muffler disposed in said housing, an exhaust duct connected to one end of said muffler and extending along one side of the frame structure to connect to the engine of said vehicle, and outlet pipe means connected to the other end of said muffler and forming an exhaust outlet at one end of said housing.

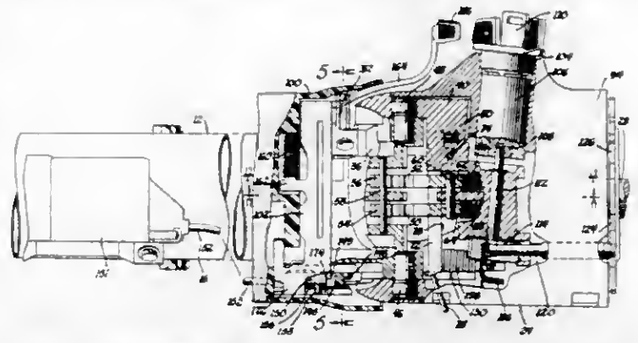
4,029,168

STEERING COLUMN LOCK INHIBITOR

Richard L. Kramer, Saginaw, Mich., assignor to General Motors Corporation, Detroit, Mich.

Filed July 14, 1975, Ser. No. 595,624
Int. Cl.² B60R *25/02*
U.S. Cl. 180—114 **2 Claims**

1. In a vehicle steering column, a support assembly secured at the upper end of said column, a tiltable head portion, pivot means pivotally connecting said head portion to said support assembly, a tiltable manual steering wheel operatively mounted adjacent to the upper end of said head portion, rotatable steering shaft means extending through said head portion and said support assembly and operatively connected to said steering wheel, said steering shaft means having pivot means therein to permit said head portion and said steering wheel to be tilted, ignition switch means operatively mounted on said column below said support assembly, a key actuated operator assembly rotatably mounted in said head portion of said steering column, locking bolt means in said head portion longitudinally movable in a first direction for locking said steering wheel and steering shaft means from rotation in response to a first predetermined rotary movement of said operator assembly, said locking bolt means movable longitudinally in a second direction for unlocking said steering wheel and steering shaft means in response to a second and opposite predetermined rotary movement of said operator assembly, said operator assembly having gear means fixed thereto, rack means drivingly connected to said gear means and longitudinally movable thereby in said first and second directions, ignition switch rod means, arcuate track means interconnecting said ignition switch rod means and said rack means to permit said head portion and said steering wheel to be tilted with respect to said support assembly, said switch rod means



being movable in said first direction to close said ignition switch means as said locking bolt means is moved in said second direction, said switch rod means being further longitudinally movable in said second direction to open said ignition switch means as said locking bolt means is moved in said first direction, a locking bolt inhibitor mounted for limited rotation within said column, said inhibitor having a manual lever extending to a terminal point closely adjacent to said key actuated operator assembly, said switch rod means terminating in an abutment end portion, said inhibitor having an abutment shoulder normally positioned to engage said abutment end portion and thereby limit movement of said ignition switch rod means in said second direction and thereby prevent rotary movement of said operator assembly in one direction and the resultant locking movement of said locking bolt means in said first direction, said inhibitor having slot means adjacent to said shoulder which accommodates said abutment end portion and permits movement of said ignition switch rod means in said second direction when said inhibitor is rotated to a predetermined position by manually depressing said lever, and said slot means having a contact surface at one end thereof which contacts said abutment end portion and inhibits movement of said ignition switch rod means in said first direction to close said ignition switch means.

4,029,169

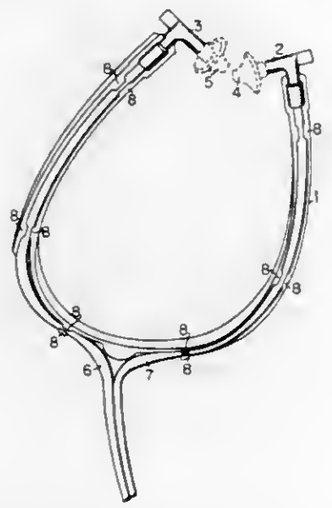
ACOUSTIC YOKE

Charles B. Huntress, Orange, Calif., assignor to Electronic Engineering Company of California, Santa Ana, Calif.

Filed Jan. 28, 1976, Ser. No. 653,052
Int. Cl.² A61B *7/02*
U.S. Cl. 181—135 **5 Claims**

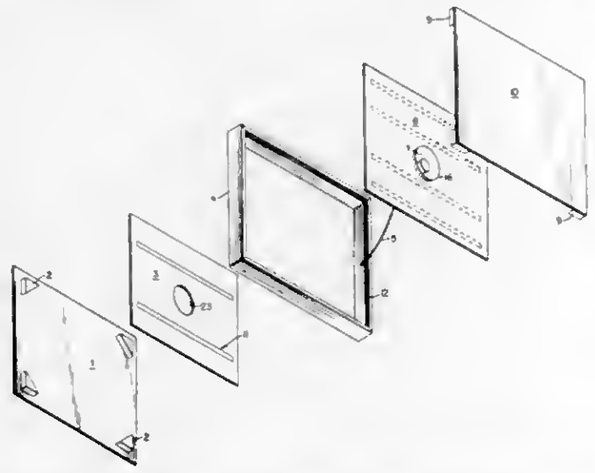
1. A yoke for retaining a pair of acoustic ear couplers in the ears of a wearer, comprising;

a. a U shaped in cross-section yoke (1) to retain a pair of flexible tubes (6 & 7),
b. an open surmounting socket (12) upon each extremity of the U shaped yoke,
each said socket having a circumference greater than a semicircle, and



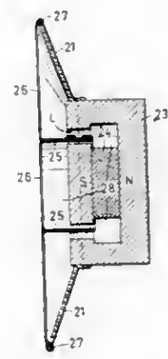
c. a hollow ear horn (3), which has a boss (11) that rotatably and removably fits within a said socket (12),
coaxially accepts a said flexible tube (6 or 7) at the boss end,
and accepts a said ear coupler (5) at the other end.

4,029,170
RADIAL SOUND PORT SPEAKER
Jesse O. Phillips, Albuquerque, N. Mex., assignor to B & P Enterprises, Inc., Oklahoma City, Okla.
Filed Sept. 6, 1974, Ser. No. 503,953
Int. Cl.² H05K *5/00;* **G10K** *13/00*
U.S. Cl. 181—155 **6 Claims**



1. An audio frequency speaker assembly for housing a conventional speaker of the type having a larger forward end and a smaller diameter rear end constituted of the magnet structure, such speaker assembly being of generally thin form for adaptation to wall surface mounting, the speaker assembly comprising:
frame means for geometrically regular character having parallel front and back sides and defining an interior space having a predetermined transverse area;
mounting panel means secured to the front side of said frame means which is of rigid construction and extending over said predetermined transverse area, said mounting panel means having a centrally located aperture which is adapted to receive the forward end of the speaker therein in secure affixure with the rear end extending within the frame means interior space, said mounting panel means further including a plurality of first elongate rib members secured to one side thereof and extending into the frame means interior space;
back panel means of rigid structure secured to the back side of said frame means and being of said predetermined transverse area;
baffle panel means of rigid structure which is similar in transverse shape but lesser than said predetermined transverse area, said baffle means having a centrally located aperture for receiving the speaker magnet end therethrough in non-interfering relationship and having a plurality of second elongate rib members disposed thereon in parallel to said first rib members as said baffle panel means is rigidly supported between said back panel means and said mounting panel means within the interior space of said frame means with said first and second rib members facing toward each other in parallel, non-interfering relationship; and
front panel means of rigid structure and having said predetermined transverse area, which means is secured in spaced relationship to the front of said frame means and mounting panel means.

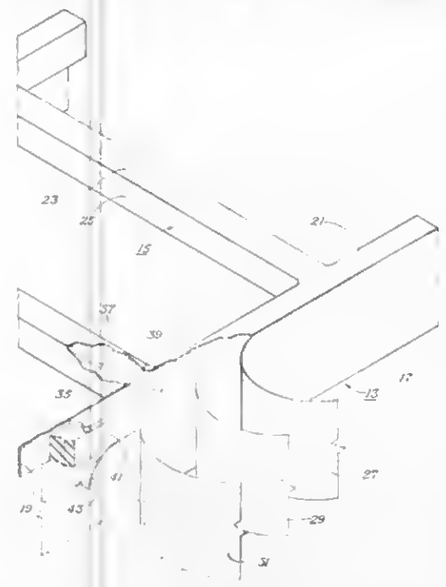
4,029,171
MEMBRANE FOR ELECTROACOUSTIC CONVERTER SYSTEMS
Josef Wilhelm Manger, Karlstadter Strasse, 8725 Arnstein, Germany
Filed Aug. 11, 1975, Ser. No. 603,310
Claims priority, application Germany, Jan. 7, 1975, 2500397
Int. Cl.² G10K *13/00;* **H04R** *7/00*
U.S. Cl. 181—167 **9 Claims**



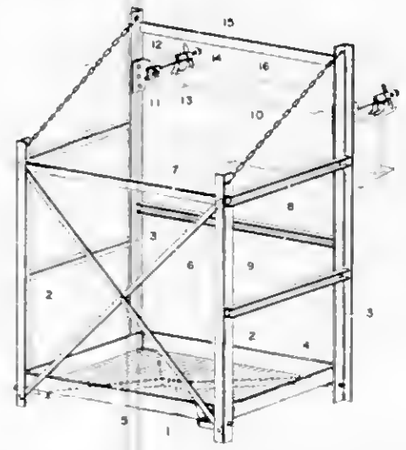
1. Diaphragm having substantial viscoelastic properties for an electroacoustic transducer system and coupled to a driving means therefor, consisting of a flat multi-layer body which has at least one layer of a substantially viscoelastic material with a substantially constant maximum damping factor over a temperature range of substantially more than 10° C and at least one layer of foil with a modulus of elasticity of more than 10,000 kg/cm².

4,029,172
FIBERGLASS LADDER AND METHOD OF CONSTRUCTING SAME
Andrew Green, Fort Worth, Tex., assignor to Composite Technology, Inc., Fort Worth, Tex.
Filed July 12, 1976, Ser. No. 704,250
Int. Cl.² E06C *1/06, 7/08*
U.S. Cl. 182—46 **10 Claims**

1. A fiberglass ladder comprising:
a pair of rails, each of the rails having a continuous layer of fiberglass filaments, the filaments extending substantially parallel to the length of the rail;
a plurality of rungs disposed between and interconnecting the rails at selected intervals, each of the rungs having a continuous layer of fiberglass filaments, the filaments extending substantially parallel to the length of the rung;
the fiberglass filaments in the rails and rungs bending at the intersections between the rails and the rungs, with a portion of the filaments in each rung also extending along each rail in one direction and another portion of the filaments in each rung also extending along each rail in the opposite direction, thereby defining a continuous layer of fiberglass filaments at the intersection.

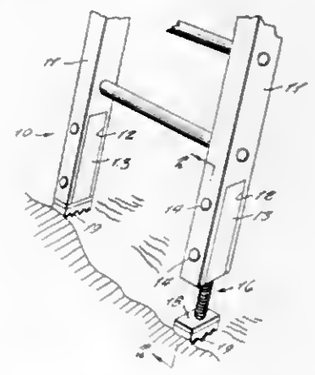


4,029,173
FOLDABLE SCAFFOLD DEVICES
Hidenori Wakabayashi, 41-227, Ohtakacho, Chiba, Japan
Filed Dec. 23, 1975, Ser. No. 643,818
Claims priority, application Japan, Dec. 30, 1974, 49-2582; Dec. 30, 1974, 49-2583
Int. Cl.² A47L *3/02;* **E04G** *3/08*
U.S. Cl. 182—150 **4 Claims**



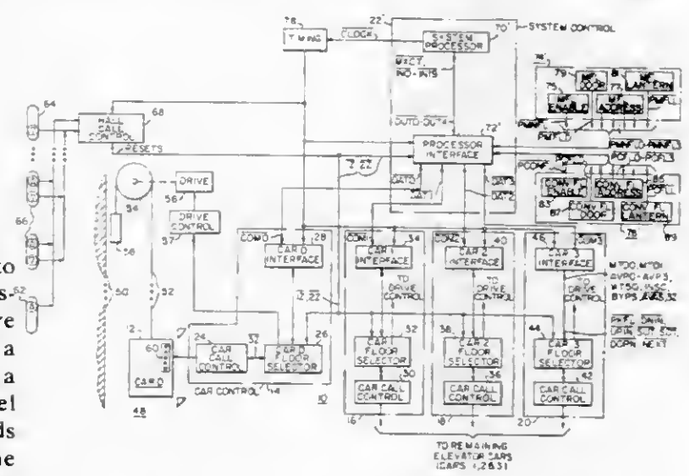
1. An erectable and transportable scaffold cage adapted to be engaged upon and supported on a suppport beam, comprising a rear frame structure, means on said rear frame structure for securing said rear frame structure to the support beam, a front frame structure shorter than rear frame structure, a plurality of lateral braces arranged in vertically spaced parallel relationship and pivotally connected at their respective ends to the respective said rear frame structure and said front frame structure, a reinforcing frame pivotally connected to each side of said rear frame structure and said front frame structure adjacent the bottom ends thereof, a flexible member connected between the tops of corresponding respective ends of said rear and front frame structures and supporting said front frame structure in an erected position spaced outwardly from said rear frame structure and also in a collapsed position with said front frame juxtaposed in respect to said rear frame, in the erected position said front and rear frames structures and said side braces defining a cage therewithin, and a scaffold plate supported on said reinforcing frame and forming a scaffold floor in the erected position.

4,029,174
ADJUSTABLE LEGS FOR LADDER
James L. Planck, c/o George Spector 3615 Woolworth Building, 233 Broadway, and George Spector, 3615 Woolworth Building, 233 Broadway, both of New York, N.Y. 10007
Filed Apr. 6, 1976, Ser. No. 674,115
Int. Cl.² E06C *7/44*
U.S. Cl. 182—204 **2 Claims**



1. In an improved ladder for standing upon inclined or other terrain, the combination of a pair of spaced apart legs with a plurality of rungs therebetween, a lower end of each leg having a notch, a metal block rigidly affixed in each said notch a threaded vertical opening in each said block, and adjustable extension means screwed in each said threaded opening wherein said extension means comprises a threaded shank supported freely rotatable at its lower end in a horizontal arm of an L-shaped extension that includes a vertical arm slidable alongside said metal block, said vertical arm having a sideward rung rigidly affixed hereto.

4,029,175
ELEVATOR SYSTEM
Charles L. Winkler, Worthington, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.
Filed May 5, 1975, Ser. No. 574,766
Int. Cl.² B66B *1/18*
U.S. Cl. 187—29 R **24 Claims**



1. An elevator system for a building having a plurality of floors, comprising:
a plurality of elevator cars,
means mounting said plurality of elevator cars for movement relative to the floors,

means registering calls for elevator service for the up and down service directions of the floors,

averaging means periodically providing a first limiting average responsive to the status of a predetermined parameter of the elevator system,

traffic detector means operable between first and second conditions in response to the demand for elevator service, with said traffic detector means being operated to its second condition in response to a predetermined demand for elevator service in a predetermined direction,

and control means responsive to said traffic detector means and said averaging means, said control means periodically assigning up and down service directions from the floors, including floor service directions which do not have a registered call, by dividing them among the elevator cars within predetermined constraints which include said first average, said control means normally limiting the number of such floor service direction assignments to each car according to said first average, with the control means modifying the normal effect of said first average when the traffic detector means is in its second condition to enable more elevator cars to receive floor service direction assignments in said predetermined service direction than the first limiting average would otherwise permit.

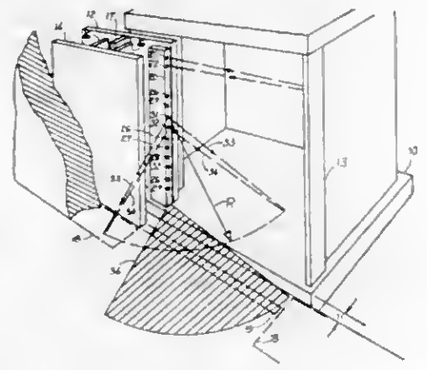
DOORWAY SAFETY DEVICE

Gerald W. Mills, 163 Arch St., Ramsey, N.J. 07446

Filed Oct. 6, 1975, Ser. No. 619,731

Int. Cl.² B66B *13/26*

U.S. Cl. 187—52 R **14 Claims**



1. In an elevator system, a structure including a hoistway having one or more landings, a hoistway door for each landing, an elevator car arranged for movement in said hoistway from one to another of said landings, said car having a door movable from an open position to a closed position against a strikepost, means for opening and closing said car door, mechanical means for coupling said hoistway door to said car door so that both doors move concurrently from an open position to a closed position or vice versa, the improvement which comprises electrical means for sensing and being responsive to objects in a predetermined zone at any position of the car door, whereby upon detecting an object in said zone said opening and closing means is energized to prevent further closure of said car door, said sensing means including transmitting and receiving means for locating a leading edge of the car door relative to the strike post, and second transmitting and receiving means positioned at a predetermined angle on the leading edge of the car door in cooperation with said locating means for detecting objects at an angle with respect to an outside surface of the car door during movement of the car door.

4,029,177

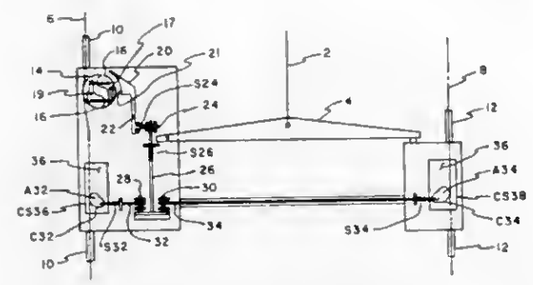
OVERSPEED BRAKE FOR A LIFT CAR

Robert A. Fiss, Red Wing, Minn., assignor to International Telephone and Telegraph Corporation, New York, N.Y.

Continuation of Ser. No. 568,793, April 16, 1975, abandoned. This application July 30, 1976, Ser. No. 710,252

Int. Cl.² B66B *5/24*

U.S. Cl. 187—89 **8 Claims**



1. A braking system in association with a lift platform having a movable lift cable for translating said lift platform and having at least one stationary guide member separate and spaced apart from said lift cable for aligning said lift platform, said system comprising a governor mounted to said lift platform and operatively engaging said guide member and said governor being coupled through a linkage to brake means, said linkage including a plurality of spring loaded elements locked together by pin means and terminating in said brake means, said brake means including a first cam surface element pivotally mounted to said lift platform and operable by said linkage to lock said guide member between said first cam surface and a second cam surface element fixedly mounted to said lift platform, said governor responding to the translation of said lift platform when the speed of said lift platform relative to said guide member exceeds a predetermined maximum, to release said pin means and permit springs associated with said spring loaded elements to apply a force through said linkage to said brake means thereby to rotate said first cam surface element into engagement with said guide means and stop motion of said lift platform.

4,029,178

HIGH-IMPACT FORCE DAMPING DEVICE

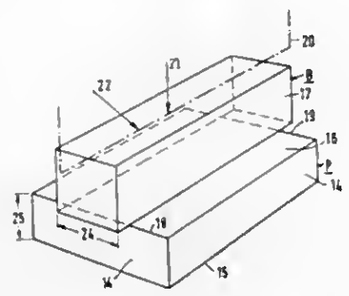
Ludwig Tschift, Vienna, Austria, assignor to Siemens Aktiengesellschaft, Munich, Germany

Filed Apr. 17, 1974, Ser. No. 461,758

Claims priority, application Germany, Apr. 19, 1973, 2320258

Int. Cl.² F16F *7/12*

U.S. Cl. 188—1 C **4 Claims**



1. A high-impact force absorbing and damping device comprising an element for receiving the impact and supported by a metal body which with increasing force strains elastically and then plastically; wherein the improvement comprises said body being in the form of a flat plate having free and unrestrained edges, and said element comprises an elongated bar made of metal harder than said metal body, said plate having a flat pressure-receiving side surface and said bar having a flat pressing side surface engaging said pressure-receiving surface, said bar's pressing surface being of substantially less width than said pressure-receiving surface, said plate being precompressed throughout the area of its said pressure-receiving surface engaged by said pressing surface of said bar.

4,029,179

DISK BRAKE WITH AXIALLY FLOATING CASING

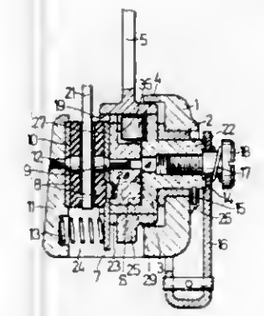
Hans Butz, Schwebheim, Germany, assignor to Fichtel & Sachs A.G., Schweinfurt am Main, Germany

Filed May 19, 1976, Ser. No. 687,696

Claims priority, application Germany, May 22, 1975, 2522622

Int. Cl.² B62L *1/02*; **F16D** *55/08*

U.S. Cl. 188—71.8 **10 Claims**



1. a disk brake comprising:

a. a support including a tubular guide bounding a passage.

1. said passage having an axis, being of circular cross section and axially open;

b. a disk member mounted on said support for rotation in a plane transverse to said axis;

c. first and second actuator members mounted in said passage for axial movement;

d. operating means for angularly moving said first actuator member about said axis;

e. securing means securing said second actuator member against angular movement about said axis;

f. cam means interposed between said actuator members for moving said second actuator member axially in said passage in response to said angular movement of the first actuator member;

g. a casing mounted on said first actuator member for limited axial movement and partly enveloping said guide,

1. said casing being formed with an opening in said plane receiving a portion of said disk member; and

h. engagement means on said casing and on said second actuator member having respective engagement faces receiving said portion of said disk member axially therebetween for braking engagement when said first actuator member is moved by said operating means.

4,029,180

TUBULAR WHEEL SPEED SENSOR FOR AN ANTI-SKID SYSTEM

Thomas A. Gee, Allen Park, Mich., assignor to Eaton Corporation, Cleveland, Ohio

Division of Ser. No. 460,325, April 12, 1974, Pat. No. 3,938,112. This application Jan. 28, 1976, Ser. No. 653,061

The portion of the term of this patent subsequent to Dec. 17, 1991, has been disclaimed.

Int. Cl.² G01P *3/48*

U.S. Cl. 188—181 R **1 Claim**

1. An anti-skid system for regulating braking forces applied to a rotatable body comprising:

control circuit means for providing a skid signal in response to a signal representative of the velocity of said body;

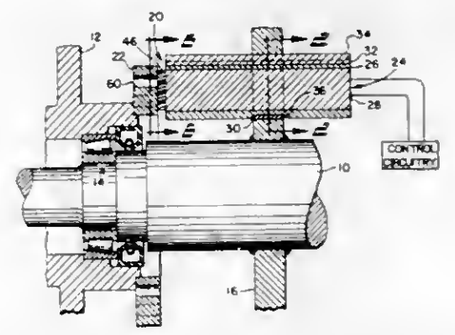
a rotor affixed to and rotatable with said body, said rotor having at least one array of apertures on the outer periphery thereof;

sensing means mounted proximate to said rotor and cooperating with said rotor to establish an air gap, said sensing means including a magnetic flux source and means for producing a split magnetic flux path, said producing means having first and second pole pieces positioned relative to said magnetic flux source so as to be parallel to and equidistant from said magnetic flux source, said magnetic flux source and said first and said second pole pieces being retained in a tubular housing permitting axial and angular movement of said sensing means to obtain the proper orientation of said sensing means for different rotor sizes and/or aperture spacings, said proper orientation of said sensing means occurring when said first and said second pole pieces are alternatively in register with said apertures in said rotor resulting in the interruption of said split magnetic flux path by said apertures when said rotor is rotated causing a flux change;

means for mounting said sensing means, said mounting means permitting axial movement of said sensing means relative to said rotor while preventing angular movement of said sensing means after said proper orientation of said sensing means is established;

gauging means adjacent said sensing means, said gauging means projecting from said sensing means and in communication with said rotor for limiting axial movement of said sensing means; and

coil means producing an output signal resulting from said flux change, said coil means being minimally responsive to any flux change resulting from relative axial movement between said sensing means and said rotor.



4,029,181

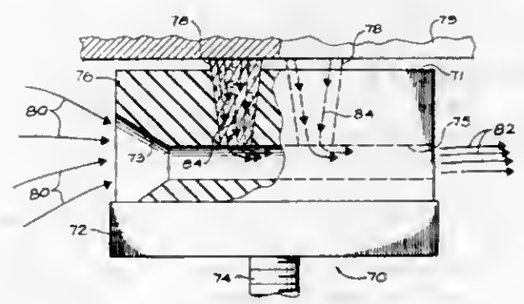
CAPILLARY ACTION BRAKE SHOE

Nathanial Henry Lewis, Box 20424, Los Angeles, Calif. 90006

Filed May 17, 1976, Ser. No. 679,606

Int. Cl.² F16D *69/00*

U.S. Cl. 188—250 B **2 Claims**



1. A brake shoe for a rim brake assembly of a bicycle having a wheel rim, said brake shoe comprising an elongated body member of frictional material and having one face thereof with a plurality of cleat inserts embedded therein, said cleat

inserts being made from an absorbent material having capillary action and frictional properties, said cleat inserts having a first face thereof exposed on said face of said body member to contact said rim, said body member having a longitudinal hole extending therethrough from end to end thereof and being parallel to said face of said body member, said cleat inserts having a second face adjacent and communicating with said longitudinal hole, thereby upon movement of said bicycle and rotation of said wheel rim air is forced through said longitudinal hole causing a suction of heat and liquid vapor through said cleat inserts when said rim is wet and said brake shoe is in contact with said rim.

4,029,182

OVERHEAD ELECTRIC TRACTION SYSTEMS

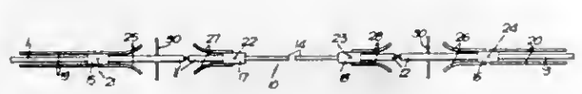
Stanley Harold Russell Proud, Marlow, England, assignor to Bicc Limited, London, England

Filed Dec. 30, 1975, Ser. No. 645,334

Claims priority, application United Kingdom, Dec. 31, 1974, 56249/74

Int. Cl.² B60M *1/18*

U.S. Cl. 191—39 **19 Claims**



1. A neutral section of an overhead electric traction system wherein a contact wire and at least one catenary wire of one of two adjacent sections of the overhead electric traction system which are to be electrically separated by the neutral section are secured to one end of an elongate insulated runner; the contact wire and at least one catenary wire of the other of said two sections of the system are secured to one end of a second elongate insulated runner; at least one elongate metallic member separates and is connected to other ends of said insulated runners, the undersurfaces of the contact wires, said insulated runners and said elongate metallic member lying in a substantially common plane; and, at each of a plurality of spaced positions along the length of the neutral section, means is provided for suspending the neutral section from a supporting structure, each of at least some of said suspension means being of such a form as to resist any torsional load to which the insulated runners may be subjected and at least said suspension means at each end of the neutral section being so resiliently loaded as to assist in lifting of the neutral section to a height similar to that of the adjacent contact wires as a current collector runs through.

4,029,183

CONTROL VALVE FOR STEERING CLUTCH AND BRAKE

Akihiro Toyomura, Hirakata, Japan, assignor to Kabushiki Kaisha Komatsu Seisakusho, Tokyo, Japan

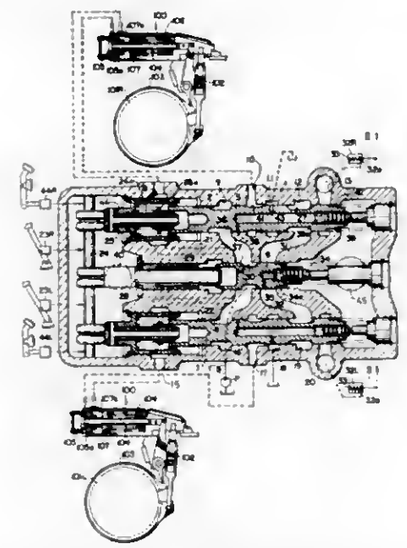
Continuation of Ser. No. 481,476, June 20, 1974, abandoned. This application Feb. 23, 1976, Ser. No. 660,370

Claims priority, application Japan, June 20, 1973, 48-72206

Int. Cl.² F16D *67/04*

U.S. Cl. 192—13 R **2 Claims**

1. A control valve for a hydraulically actuated steering clutches and steering brakes, comprising a valve housing having a plurality of bores therein; first, second and third spools slidably disposed within said respective bores; right and left hand operating rods operatively connected to said first and third spools respectively, and both rods mechanically connected to said second spool; means for disengaging either one of the steering clutches by supplying hydraulic fluid by two of said spools into a pressure chamber thereof when either one of the right and left operating rods is moved along a predetermined stroke to operate said second spool and one of said first and third spools; and means for applying either one of the steering brakes by supplying hydraulic fluid by one of said first and third spools into a pressure receiving chamber for the brake thereof when said operating rod is further moved



along a second predetermined stroke to further operate said one of said first or third spools.

4,029,184

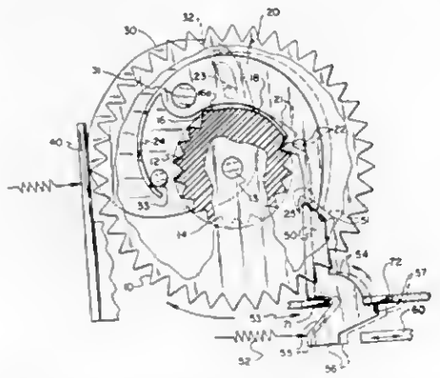
PAWL AND RATCHET CLUTCH

Guilford Edwin Kindig, Rochester, and Henry Stanislaus Adamski, Webster, both of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Apr. 9, 1976, Ser. No. 675,102

Int. Cl.² F16D *11/06*

U.S. Cl. 192—28 **12 Claims**



1. An improved pawl and ratchet clutch, comprising a pawl, a rotatable ratchet wheel including a plurality of generally similarly sized teeth adapted to engage the pawl and rotate with the pawl in coupled engagement, pawl releasing means locatable in the path of the pawl when it is coupled with the wheel to uncouple the pawl from coupled engagement with the wheel, and the improvement which comprises:

means on the ratchet wheel and extending further radially outwardly beyond the radial extent of the generally similarly sized teeth for moving the uncoupled pawl away from the wheel; whereby the pawl releasing means holds the uncoupled pawl out of contact with the generally similarly sized teeth of the ratchet wheel as the wheel is rotated relative to the uncoupled pawl.

4,029,185

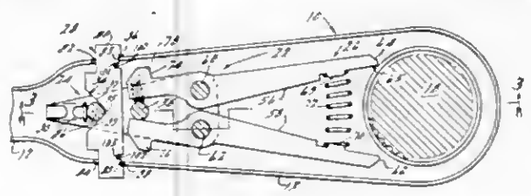
TORQUE TRANSMITTING AND INDICATING DEVICE

Michael M. Walsh, Northville, Mich., assignor to Eaton Corporation, Cleveland, Ohio

Filed Nov. 3, 1975, Ser. No. 628,000

Int. Cl.² F16D *41/16;* **B25B** *23/142;* **G08B** *3/02*

U.S. Cl. 192—30 W **23 Claims**



1. A torque transmitting and indicating device comprising:

A. a rotatable input drive member having a housing portion encompassing its rotational axis;

B. an output drive member rotatable about said input drive rotational axis and adapted to be connected to a load;

C. a carrier member disposed within said housing portion;

D. means mounting said carrier member within said housing portion for pivotal movement relative to said housing portion about an axis parallel to but displaced from said input drive rotational axis;

E. pawl drive means having a load engaging portion at one end thereof;

F. mounting means for carrying said pawl drive means for pivotal movement with said carrier member and for permitting pivotal movement of said pawl drive means relative to said carrier member about an axis parallel to said input drive rotational axis between a first operative position and a second indicating position;

G. means pivotally biasing said pawl drive means into said first position; and

H. means pivotally biasing said carrier member and thereby said pawl drive means into driving engagement with said output drive member at a point thereon displaced from a plane containing said pawl drive and carrier pivotal axes whereby rotation of said input drive member in one direction effects the transmission of torque to said output member and a resultant force reaction at said point of engagement acts against said carrier biasing means and said pawl biasing means to pivot said pawl drive means to said second indicating position when said torque exceeds a predetermined magnitude.

4,029,186

RADIALLY MOVABLE CLUTCH RELEASE BEARING

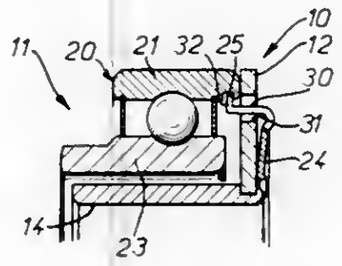
Gerard De Gennes, Senlis, France, assignor to Societe Anonyme Francaise du Ferodo, Paris, France

Filed Mar. 9, 1976, Ser. No. 665,320

Claims priority, application France, Mar. 21, 1975, 75.08847

Int. Cl.² F16C *19/00, 33/30*

U.S. Cl. 192—98 **21 Claims**



1. A clutch release bearing of the kind comprising an actuating element having means for cooperation with clutch actuating means, and a drive element having a surface portion for cooperation with a clutch release member, said clutch release bearing having an axis, a self-centering connecting means of one-piece resilient construction connecting said actuating element and drive element together and permitting relative movements in all directions in a plane perpendicular to the axis of said clutch release bearing, and said self-centering connecting means comprising an axially acting resilient clamping Belleville washer bearing on one periphery thereof against one of said elements, and integral fastening claws disposed around and projecting from said other periphery of said Belleville washer in spaced relation, said fastening claws being engaged with said other element and acting in tension thereon while said Belleville washer axially resiliently urges said elements towards each other.

4,029,187

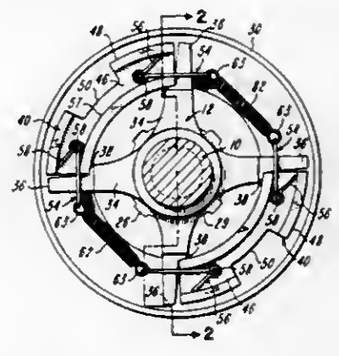
CLUTCH WITH CENTRIFUGALLY ACTUATED SPRINGS

Marion H. Davis, and John W. Cleghorn, both of Hagerstown, Ind., assignors to Pay-Bak, Inc., Hagerstown, Ind.

Filed June 16, 1975, Ser. No. 587,254

Int. Cl.² F16D *43/14*

U.S. Cl. 192—105 BA **19 Claims**



1. In a centrifugal clutch of the type comprising a driven drum rotatable about a rotary axis, a driving spider rotatable about the same axis and disposed concentrically within said drum, said spider having plural arms radiating outwardly toward the interior wall of said drum, clutch shoes received between diametrically opposite pairs of said arms, and yielding means connected between said shoes to resist centrifugal actuation of said shoes toward said interior wall on rotation of said spider; the improvement wherein said yielding means comprise spring means disposed to opposite sides of said rotary axis, said spring means drawing said clutch shoes radially inwardly toward said rotary axis in the absence of spider rotation, said spring means sized as to mass and force constant to bow outwardly away from said rotary axis toward the interior wall of said drum to positions in which said spring means draw said clutch shoes primarily in a circumferential direction about said rotary axis, the size and mass of said spring means predetermined to cause said spring means to shift the direction in which said spring means draw said clutch shoes from a radial direction to a circumferential direction at substantially the same angular velocity of said spider as required to centrifugally actuate said clutch shoes to engagement with the interior wall of said drum.

4,029,188

CONTROL APPARATUS OF STEERING CLUTCH FOR TRACTOR

Toshikatsu Okano, Mikawamachi, Japan, assignor to Kabushiki Kaishi Komatsu Seisakusho, Tokyo, Japan

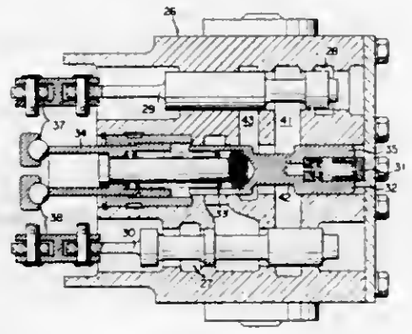
Filed Nov. 18, 1975, Ser. No. 633,103

Int. Cl.² F16D *25/10*

U.S. Cl. 192—109 F **3 Claims**

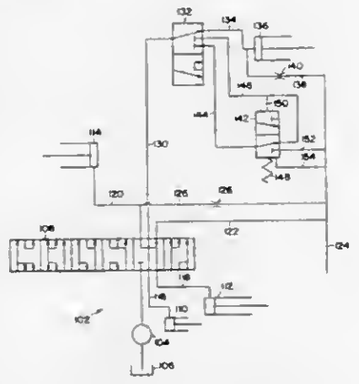
1. A control apparatus in a steering clutch for a tractor comprising

a pair of steering clutches,
a pair of yokes mounted on said steering clutches to release and connect said steering clutches,
a pair of rocking levers engaged with said yokes at one end thereof,
a pair of piston means connected to said pair of rocking levers at the opposing ends of said rocking levers, each of said piston means having a chamber contained therein, and valve means connected to said chambers of said



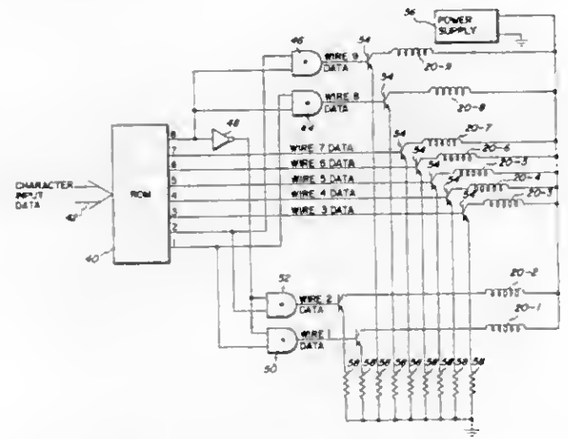
piston means with said valve means comprised of a valve body,
a first spool slidably disposed in said valve body, a second spool slidably disposed in said valve body, and a relief valve slidably disposed in said valve body, and an operator connected to each said first and second spools and both operators connected to said relief valve for selectively releasing and connecting said pair of clutches and controlling the pressure thereto.

4,029,189
WINCH CLUTCH PRESSURE REDUCING VALVE AND LUBRICATION SYSTEM
Thomas William Freiburger, Dubuque, Iowa, assignor to Deere & Company, Moline, Ill.
Filed May 5, 1975, Ser. No. 574,554
Int. Cl.² F16D *13/72*
U.S. Cl. 192—113 B **4 Claims**



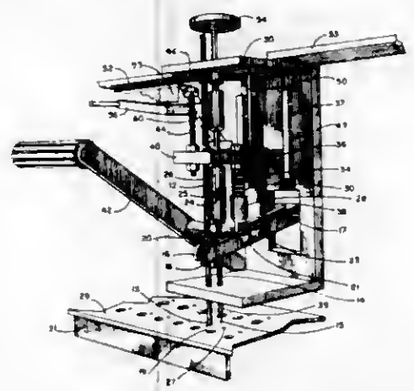
1. In a combination of a hydraulically operable clutch and hydraulic control system therefor wherein the clutch includes friction elements and a hydraulic actuator for effecting full engagement of the friction elements in response to receiving operating fluid as a predetermined minimum pressure and wherein the control system includes a source of fluid pressure connected to a direction control valve operative for selectively connecting or disconnecting the source of fluid pressure to or from a clutch line, and a lubrication fluid passage means connected in fluid communication with the friction elements of and including a primary lubrication feed line connected to the actuator of the clutch, the improvement comprising: a pressure reducing valve means connected to the clutch line and to the hydraulic actuator of the clutch; said clutch line being connected only between the direction control valve and the pressure reducing valve means; said lubrication fluid passage means including a supplemental lubrication fluid feed line means connected to the pressure reducing valve means; and the pressure reducing valve means being selectively operable, only when at least said minimum pressure exists in the clutch line, to establish a normal first operating condition for connecting fluid pressure in the clutch line to the actuator so as to establish full pressure engagement of the clutch while blocking fluid communication between the clutch line and the supplemental lubrication fluid feed line means, and to establish a second operating condition for connecting fluid pressure in the clutch line to the actuator so as to establish partial pressure engagement of the clutch and to connect the clutch line to the supplemental lubrication fluid feed line means.

4,029,190
FONT CONVERSION APPARATUS
Robert A. Ragen, Hayward, and Carl E. Herendeen, Danville, both of Calif., assignors to Xerox Corporation, Stamford, Conn.
Filed June 28, 1976, Ser. No. 700,418
Int. Cl.² B41J *3/50*
U.S. Cl. 197—1 R **18 Claims**



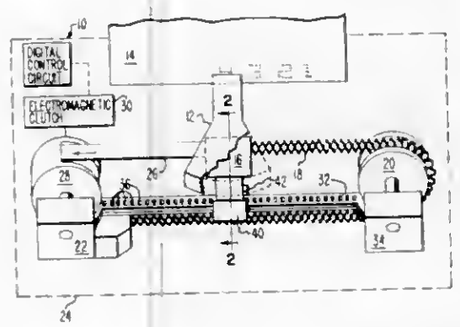
1. Apparatus for energizing a selected one or more of a plurality of actuating devices in order to cause a printing element associated with each selected actuating device to strike on adjacent recording medium, said apparatus comprising:
memory means responsive to a predetermined address signal for supplying a plurality of data bits and a conversion bit together identifying those actuation devices selected for energization;
a plurality of switches respectively coupled to said plurality of actuation devices, each switch capable of energizing its respective actuation device in response to receipt of a data bit of a first state;
first means coupled to said memory means and to first and second predetermined ones of said switches and being responsive to said conversion bit being of a first state for supplying a first predetermined data bit to said first predetermined switch and responsive to said conversion bit being of a second state for supplying said first predetermined data bit to said second predetermined switch; and
second means coupled to said memory means and to other ones of said switches for respectively supplying other ones of said data bits to said other ones of said switches.

4,029,191
VARIABLE SPACING PRINTING APPARATUS
Edward J. Klem, Las Vegas, Nev., assignor to Angelina M. Klem and Robert B. Pahor, both of Las Vegas, Nev., part interest to each
Filed May 1, 1975, Ser. No. 573,617
Int. Cl.² B41J *1/16, 19/00, 3/28*
U.S. Cl. 197—2 **12 Claims**



1. In a printing apparatus having a movable platen for securing a material to be printed on and a type case positioned above said platen and enclosing a plurality of types for printing on said material, the improvement comprising:
a first reciprocating rod having a lower end for being received in a selected one of a plurality of first type case cover orifices and actuating one of said types when said rod is depressed;
a second reciprocating rod having a lower end for being received in a selected one of a plurality of second type case cover orifices and means for adjusting the elevation of said second rod;
handle means for reciprocally depressing and elevating the first and second rods;
a movable rack and a rigid arm member secured to both the rack and said movable platen whereby movement of said rack causes movement of said platen;
a retractable pawl cooperating with said handle means for being retracted along said rack when the handle is depressed and engaging and advancing said rack and concomitantly said arm and platen when said handle is elevated; and
means cooperating between said pawl and said second rod whereby the retraction of said pawl along said rack is changed by adjusting the elevation of the second rod.

4,029,192
DIGITAL CIRCUIT FOR CONTROLLING THE RETURN SPEED OF A BUSINESS MACHINE CARRIAGE
Chockalingam Manthiram, Plymouth, Mich., assignor to Burroughs Corporation, Detroit, Mich.
Filed Feb. 27, 1975, Ser. No. 553,536
Int. Cl.² B41J *5/30*
U.S. Cl. 197—19 **10 Claims**



1. A digital circuit for selectively activating a clutch mechanism for limiting the return speed of a business machine carriage having a spring biased carriage return mechanism, said circuit comprising:
means for producing a continuous output pulse in response to input sync pulses indicating the return speed of the carriage along its return path, the pulses having intervals therebetween, the intervals signalling that the return speed of the carriage has exceeded a predetermined maximum speed; and
means for coupling said continuous output pulse producing means to the clutch mechanism, said clutch being activated by the continuous output pulse to thereby limit the return speed of the carriage to the predetermined maximum speed.

4,029,193
PRINTER HAVING A PLATEN WITH RESILIENT SEGMENTS
Okun Kwan, Trumbull, Conn., assignor to Bunker Ramo Corporation, Oak Brook, Ill.
Filed Mar. 31, 1975, Ser. No. 563,528
Int. Cl.² B41J *11/20*
U.S. Cl. 197—149 **2 Claims**

1. A printer platen for alternatively providing a printer support surface for single sheets, multiple sheets or documents of varying thickness, comprising:
an elongated support means for mounting other platen components thereto;
first and second document contacting members overlying the support means and normally positioned in aligned spaced relation to each other;
a third document contacting member overlying the support means normally positioned in intermediate aligned abutting relationship with the first and second document carrying members;
a plurality of spring means, each connected between the support means and a respective document contacting member;
means connected between the support means and the document contacting members for normally maintaining a continuous surface between all of the members;
wherein the continuous surface is planar for a document of uniform thickness and further wherein the third member may yield relative to the first and second members for supporting the bulge of a document centerfold while first and second flat portions of a document are supported by the first and second members, in a manner permitting continuous line printing across the centerfold.

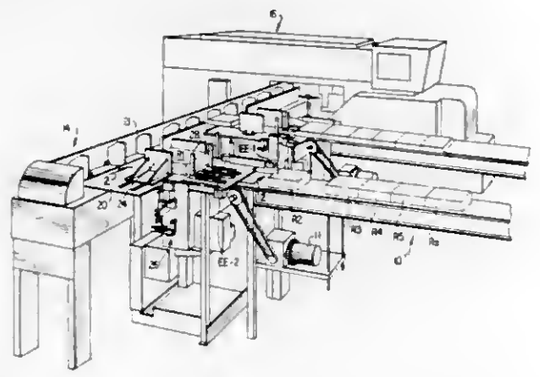
4,029,194
AUTOMATIC INDEXING AND TRANSFERRING APPARATUS
Ludwig J. Feurstein, Sheboygan; Otis E. Meives, Cleveland, and Roger E. Schelk, Sheboygan, all of Wis., assignors to Pemco, Inc., Sheboygan, Wis.
Continuation of Ser. No. 469,562, May 13, 1975, abandoned. This application Apr. 23, 1975, Ser. No. 570,912
Int. Cl.² B65G *47/42*
U.S. Cl. 198—358 **5 Claims**

1. An article transferring apparatus, comprising:
a transfer table for receiving articles to be transferred from an infeed conveyor;
a transferring member for individually moving said articles across said table onto an outfeed conveyor;

means connected to said transferring member for elevating it behind each individual article and for pushing each individual article with said transferring member across said table onto said outfeed conveyor;

first control means for actuating said elevating means to elevate said transferring member behind an individual article in position for pushing that article in response to movement of that article onto said table;

means for monitoring the presence of a preceding article on said outfeed conveyor in the path of a following article,



said monitoring means comprising an enclosed volume having an orifice opening in a wall thereof, said opening being positioned to be covered by a preceding article located on said outfeed conveyor in the path of a following article; means for admitting fluid under pressure to said volume; switch means responsive to a preselected pressure rise in said volume when said orifice is covered; and

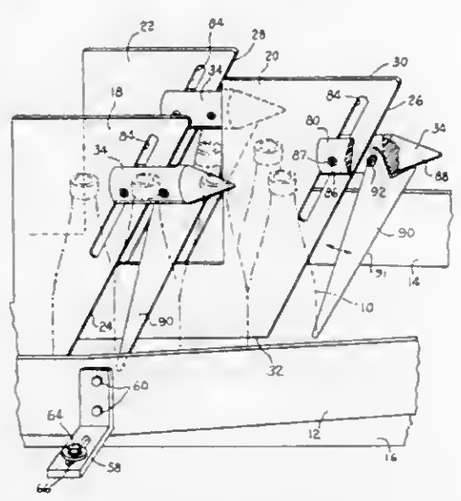
means responsive to said switch means for temporarily preventing actuation of said infeed conveyor and said elevating means.

4,029,195

GUIDE APPARATUS FOR AN ARTICLE CONVEYING MACHINE

Thomas P. Hartness, 305 Bridgewater Drive, and Robert G. Hartness, 203 Wilmington Road, both of Greenville, S.C. 29607

Filed Sept. 24, 1975, Ser. No. 616,427
Int. Cl.² B65G *47/24*
U.S. Cl. 198—399 **8 Claims**



1. For use in bottle handling machines and the like wherein bottles are conveyed on a conveyor in a co-mingled mass to a guide apparatus for aligning the bottles in parallel rows to be conveyed in rows, said guide apparatus comprising:

a pair of outside guide rails carried above said conveyor upon which the bottles travel,

at least one intermemdiate guide rail carried above a longitudinal portion of said conveyor,

an inclined leading edge carried by said intermediate guide rail being inclined downwardly in the direction of conveyance from adjacent the top edge to the bottom edge of said guide rail for engaging a body portion of said bottle when in a tilted position,

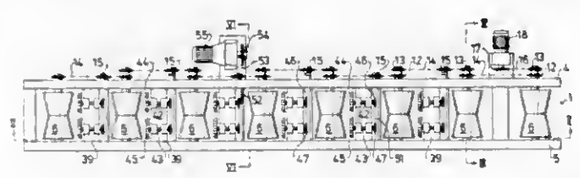
a wedging device carried by said intermediate guide rail for separating the bottles into parallel aligned rows between said guide rails, and said inclined leading edge positioning any tilted bottles to an upright position while being moved by said conveyor.

4,029,196

DEVICE FOR ROTATING PIECES OF LUMBER

Rolf Ekholm, Nyland, Sweden, assignor to A.B. Hammars Mekaniska Verkstad, Nyland, Sweden

Filed Sept. 19, 1975, Ser. No. 614,883
Claims priority, application Sweden, Oct. 7, 1974, 7412583
Int. Cl.² B65G *47/24*
U.S. Cl. 198—413 **3 Claims**



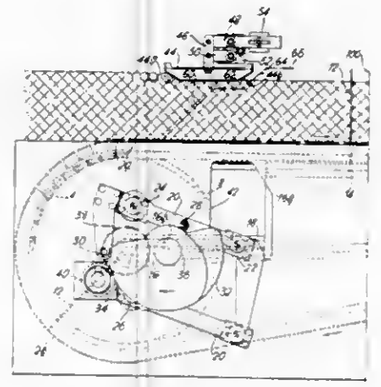
1. Lumber conveying and inspection apparatus comprising, in cooperative combination, an elongated conveyor for longitudinally receiving and longitudinally transporting pieces of lumber, and a lumber rotating device for selective rotation of the conveyor transported pieces of lumber about the longitudinal axes thereof; said elongated conveyor including a series of spaced transversely oriented transport rollers aligned therealong and defining a supporting plane for the pieces of lumber, and means continuously rotating said rollers in a common direction for the longitudinal transporting of the pieces of lumber; said rotating device comprising a lifting frame underlying and paralleling said conveyor, said frame supporting a plurality of pairs of spaced lumber turning wheels, one pair of wheels being located between each pair of adjacent conveyor rollers, the wheels of each pair being mounted on individual shafts for continuous rotation in a common direction about axes parallel to the length of the conveyor, and means for vertically moving said frame between a first position wherein the lumber rotating wheels are oriented below the roller defined supporting plane, and a second position wherein the wheels are oriented above the roller defined supporting plane for a raising of the lumber above the plane for directly supporting the lumber by the wheels for a rotation of the lumber about the longitudinal axis thereof, said lifting frame includes two horizontal lifting beams, each of said lifting beams including a short downwardly extending leg substantially at each end of said beams, each of said legs being connected to a first lever, said first levers being connected to transverse shafts connecting one of said legs on each of said beams, said conveyor including a pair of support beams and said shafts being supported by bearings mounted on said support beams, a free end of each of said levers being attached to a second lever, said second levers connected to one shaft being connected by a rod to said second levers of the other shaft, one of said second levers and rod being connected to a piston rod and hydraulic cylinder means for lifting said lifting beams and said frame, said hydraulic cylinder means being mounted to said supporting beams by a universal joint.

4,029,197

APPARATUS FOR HANDLING CIGARETTES OR OTHER ROD-LIKE ARTICLES

Peter Alec Clarke; Stanley Victor Starkey, and William Alfred Stone, all of Deptford, England, assignors to Molins Limited, England

Filed Jan. 5, 1976, Ser. No. 646,845
Claims priority, application United Kingdom, Jan. 17, 1975, 2075/75
Int. Cl.² B65G *47/22*
U.S. Cl. 198—425 **14 Claims**



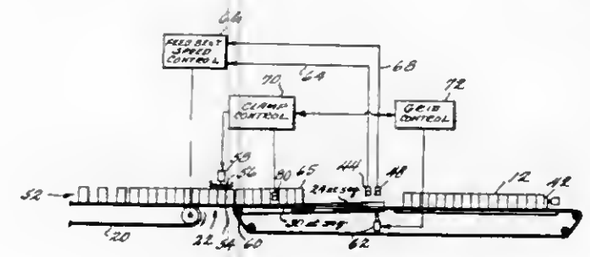
10. Apparatus for dividing a stream consisting of a stack of rod-like articles, comprising conveyor means for supporting and moving the stream, dividing means associated with the conveyor means and arranged to be projected upwards into the stream from a lower position retracted below the conveyor means, guide means for causing movement of the dividing means from the lower position to an upper position in which the dividing means is fully projected through the stream, and pressure means for exerting a pressure on top of the stream over at least part of the region where the dividing means is moving through the stream, wherein the dividing means and guide means are arranged so that the dividing means is projected into the stream in at least two distinct stages, the stages being separated by a dwell zone during which the dividing means remains at the same level above the conveyor means.

4,029,198

METHOD AND APPARATUS FOR FORMING GROUPS OF BRICKS

Hans Lingl, Jr., Paris, Tenn., assignor to Lingl Corporation, Paris, Tenn.

Filed July 5, 1973, Ser. No. 376,302
Int. Cl.² B65G *47/26*
U.S. Cl. 198—425 **25 Claims**



1. Apparatus for rapidly and accurately grouping block-like articles into predetermined lengths having at least one such article in each length, said apparatus comprising:

first transport means for supplying a moving series of said articles,

accumulating means disposed to receive said articles from said first transport means and for frictionally engaging such articles so as to slow but not stop their further motion thereon and to cause them to accumulate thereon in closed-up formation,

sensor means for detecting when said predetermined length of at least one article has been accumulated on said accumulating means and for producing a control signal in response thereto,

second transport means disposed to cooperate with said accumulating means for transporting said predetermined length therefrom, and

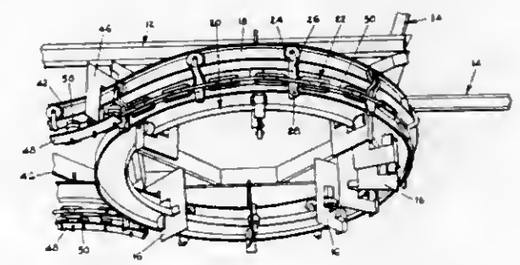
second transfer control means, for effectively disengaging said accumulating means from said predetermined length and for engaging said second transport means therewith in response to said control signal.

4,029,199

OVERHEAD CONVEYOR AND GUIDE LOOP

Frank D. Reens, Grand Rapids, Mich., assignor to Planet Corporation, Lansing, Mich.

Filed Sept. 15, 1975, Ser. No. 613,067
Int. Cl.² B65G *15/60*
U.S. Cl. 198—678 **11 Claims**



1. In an overhead conveyor apparatus having:

a track forming a closed loop, at least a portion of said track forming an arcuate track portion;

a continuous conveyor supported by said track, said conveyor including wheels which roll on said track, work supports secured to the wheels and flexible connectors connecting each of the supports to an adjacent support; and

guide means in engagement with the work supports for guiding the work supports around the arcuate track portion to maintain the conveyor in a taut condition;

the improvement in said guide means comprising:

a circular guide ring having a circular outer circumferential surface and a completely open central portion free from structural interference from the guide means mounting structure and adapted to allow spray equipment to pass vertically therethrough;

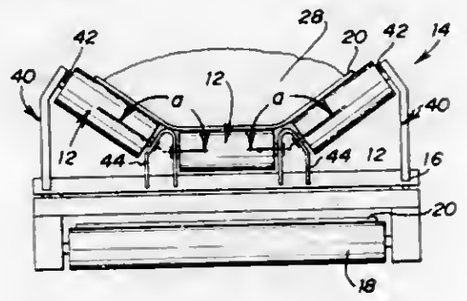
means inwardly of said guide ring circumferential surface at said arcuate track portion for mounting said circular guide ring for rotation about an axis coincidental with the center of curvature of the arcuate track portion and for maintaining said guide ring in a predetermined lateral position, said mounting means positioning said circular guide ring circumferential surface in contact with at least the work supports so that said circular guide ring rotates as said conveyor passes through said arcuate track portion;

said mounting means and said maintaining means defining a completely open central area including at least portions of said guide ring open central portion to allow spray equipment and the like to pass therethrough;

whereby said conveyor is smoothly guided through said arcuate track portion.

4,029,200
TROUGHED ROLLERS FOR BULK MATERIAL HANDLING

Jan J. Dillon, Irving, Tex., assignor to F.E.I., Inc., Dallas, Tex.
Filed Nov. 3, 1975, Ser. No. 628,213
Int. Cl.² B65G 15/08
U.S. Cl. 198—830 7 Claims

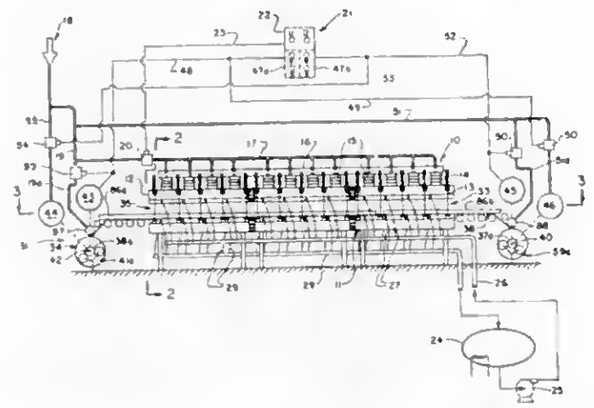


1. A heavy-duty self-lubricating roller for use in a belt conveyor system employing troughed rollers comprising:
an outer elongated hollow cylindrical tube for supporting an advancing conveyor belt;
an inner elongated hollow cylindrical tube dimensioned to be concentrically disposed within said outer tube;
a pair of cylindrical plastic end pieces each having a right circular cylindrical aperture extending through the center thereof;
said plastic end pieces being dimensioned so that each end of said inner tube is closely received within the aperture of one of said end pieces and the exterior cylindrical surface of each of said end pieces is closely received within each end of said outer tube;
means for rigidly interconnecting said outer and inner plastic tubes to said cylindrical end pieces;
self-lubricating plastic cylindrical bearing members dimensioned to be closely received within said aperture of each of said cylindrical end pieces;
said cylindrical bearing members having annular flanges formed on the outer end thereof to regulate the seating depth of said cylindrical bearing members within said cylindrical end pieces; and
a blind socket formed in the center of the outer end of said cylindrical bearing members, said blind socket being dimensioned to closely receive a generally spherical bearing.

4,029,201
CONVEYOR APPARATUS

Bernard H. Davis, Stoney Creek, Canada, assignor to H. H. Robertson Company, Pittsburgh, Pa.
Filed Oct. 2, 1975, Ser. No. 618,926
Int. Cl.² B65G 21/12
U.S. Cl. 198—858 17 Claims

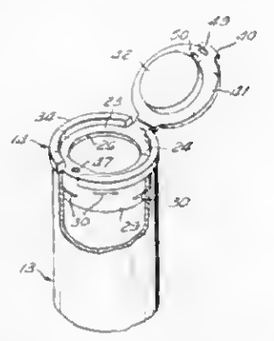
1. Conveyor apparatus comprising:
a horizontal, generally rectangular, stationary bed;
a feed roll positioned at one end of said bed;
a take-up roll positioned at the opposite end of said bed;
conveying means extending from said feed roll over said bed to said take-up roll;
first cradle means at each end of said feed roll supporting the same for rotation about a first roll axis extending transversely of said bed;
second cradle means at each end of said take-up roll supporting the same for rotation about a second roll axis substantially parallel to said first roll axis;
first drive means for rotating said take-up roll about said second roll axis, thereby to move said belt means over said bed in a forward direction;
second drive means operable independently of said first drive means for rotating said feed roll about said first roll axis, thereby to move said belt means over said bed in a reverse direction;
first clutch means for operatively connecting said first drive means to said take-up roll during movement of said belt means in said forward direction, and for disconnecting said first drive means from said take-up roll during movement of said belt means in said reverse direction; and



second clutch means for operatively connecting said second drive means to said feed roll during movement of said belt means in said reverse direction and for disconnecting said second drive means from said feed roll during movement of said belt means in said forward direction.

4,029,202
CONTAINER WITH PLASTIC CAP AND DISPLAY RACK THEREFORE

Lawrence E. Lasich, Twinsburg, and Charles Tecco, Northfield, both of Ohio, assignors to Weatherchem Corporation, Twinsburg, Ohio
Filed May 26, 1976, Ser. No. 673,073
Int. Cl.² B65D 1/36
U.S. Cl. 206—562 12 Claims

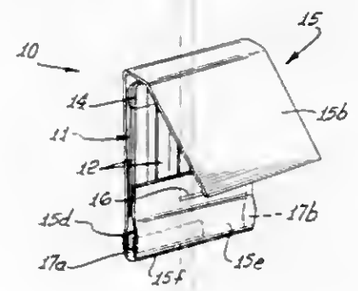


1. In combination, a paper fiber tube, a plastic end closure, and a display rack; said paper fiber tube being a longitudinally extending tube of cylindrical lateral cross sectional configuration and having an inner wall and an outer wall and a first end and a second end, said first end being closed, and said first end having an outer peripheral portion and a longitudinally inwardly recessed center portion spaced longitudinally inwardly from said outer peripheral portion; said plastic end closure being of one-piece construction and including a generally flat annular base, said base having a top wall and a bottom wall, an annular skirt portion connected to said bottom wall of said base and extending longitudinally away from said base, said skirt portion being received within said second end of said tube, a tab movable between an open position and a closed position, said tab being hingedly connected to said base, said tab being a generally disc shaped member, said tab including a longitudinally inwardly recessed center portion; said display rack including a display board and an open cavity in said display board, said cavity having a first end and a second end,

a resilient finger at said first end and at a said second end of said cavity, said fiber tube and said plastic end closure being received within said cavity, said resilient finger at said first end of said cavity projecting longitudinally into said recessed center portion of said tube at said first end of said tube, and said resilient finger at said second end of said cavity projecting longitudinally into said recessed center portion of said tab.

4,029,203
MATCH BOOK

Nelson G. Shawn, 8406 Hollywood Blvd., Los Angeles, Calif. 90069; Anthony L. Gabrio, and Iris G-S Gabrio, both of 348 N. Windsor Blvd., Los Angeles, Calif. 90004
Filed Feb. 26, 1976, Ser. No. 661,659
Int. Cl.² A24F 27/18, 27/00, 27/12
U.S. Cl. 206—108 5 Claims

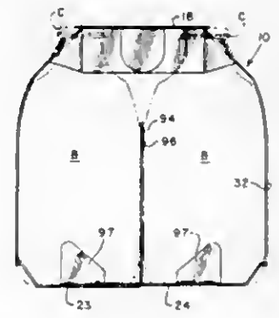


1. In a match book resistant to right-handed children, the combination comprising
a. a parallel match cluster having friction ignitable heads
b. protective cover means for the cluster and defining a fold attached to the cluster remotely from said heads, the cover means including a back and a front flap attached thereto to extend over the heads and toward the fold for releasable retention thereby, and
c. said fold defining a transverse through slot having a left end opening and a right end opening relative to the book when viewed frontally toward said front flap,
d. and abrasive ignition material bonded to at least one inner surface of the fold extending transversely between said left end opening and a locus proximate the medial portion of the slot, all inner surfaces of the slot extending between said locus and the right end opening being entirely free of said material defining a decoy slot extent therebetween, said decoy slot extent being open to receive a match head inserted from the right end of the slot, whereby a match head may be ignited only after insertion into said fold via said left end opening, and withdrawal from said slot via said left end opening accompanied by pressural contact with said material.

4,029,204
BOTTLE PACKAGE

Guelfo A. Manizza, Blauvelt, N.Y., assignor to Federal Paper Board Company, Inc., Montvale, N.J.
Filed June 23, 1975, Ser. No. 589,242
Int. Cl.² B65D 65/12, 85/30
U.S. Cl. 206—140 4 Claims

1. An elongate blank of foldable sheet material cut and scored for wrapping about a group of articles in the form of bottles arranged in double row, transversely paired relation, so as to enclose the articles in a tubular container, said blank being divided by longitudinally spaced, transverse score lines into a top wall forming panel adapted to be positioned on the tops of the articles, adjoining side wall forming panels adapted to be positioned on the outermost sides of the articles and end panels adapted to be connected beneath the articles so as to form a bottom wall, the score lines separating the top wall forming panel from the adjoining side wall forming panels being interrupted by transversely spaced apertures adapted for receiving top portions of the articles, the bottom wall forming panels and the adjoining side wall forming panels having apertures spaced transversely of the blank which interrupt the score lines separating the same and which are formed for receiving bottom portions of the articles, one of said bottom wall forming end panels having transversely spaced locking tab members and longitudinally aligned latching fingers arranged in paired relation with the tab member and latching finger of each pair thereof being spaced longitudinally of the blank, and the other one of said bottom wall forming end panels having transversely spaced locking apertures in which said locking tabs and latching fingers are engaged when the container is formed, said locking apertures each being aligned longitudinally of the blank with a pair of the locking tab and latching finger members and having a dimension longitudinally of the blank which enables the locking tab and the associated latching finger to be engaged therein, said blank having a panel forming an extension of the end panel in which said transversely spaced apertures are located, which extension panel is separated from the bottom wall forming portion of the associated end panel on a cutting line having portions thereof extending transversely of the blank and adjoining portions extending in a generally longitudinal direction which are in paired spaced relation and disposed between the portions of said end panel in which said apertures are located, the longitudinal portions of each pair of said cutting line portions terminating at opposite ends of hinge forming score lines which extend between said longitudinal cutting line portions and which are aligned transversely of the blank so as to provide a hinge connection for said partition panel, said hinge forming score lines being spaced from the transverse edge of said



apertured portions of said end panel which are defined by the transversely extending portions of said cutting line, whereby said longitudinal partition forming panel is derived in part from the adjoining bottom wall forming end panel, and said longitudinal partition forming panel having an overall dimension in the direction longitudinally of the blank and extending from said hinge forming score lines which is greater than the corresponding dimension of the apertured portions of said end panel and which is less than the height of said articles, said dimension being sufficient, when said partition forming panel is hinged to an upstanding position between the two rows of articles in the container, to separate otherwise contacting portions of the articles and to provide for holding the rows of articles in non-contacting, separated relation.

2. A package comprising a group of articles in the form of bottles arranged in double row, transversely paired relation and enclosed in a tubular container formed by wrapping a single blank of foldable sheet material about the group of bottles, said container comprising a top wall forming panel overlying the tops of said bottles in the two rows thereof, adjoining side wall forming panels extending down along the outermost sides of said bottles and bottom wall forming panels having their margins overlapped and connected by interengaging locking and latching elements, means at the juncture of said top wall forming panel and said adjoining side wall forming panels for holding the top portions of said bottles against movement in the direction of the ends of the tubular container and means at the juncture of said bottom wall forming panels and said side wall forming panels for bolding the bottom

portions of the bottles against movement in the direction of the ends of the tubular container, and said bottom wall panels having an associated, hingedly connected, bottle separating panel disposed in upstanding relation between the rows of bottles which separating panel is of sufficient dimensions to extend to a point above the center portions of the bottles and to provide a center longitudinal partition for holding the rows of bottles in non-contacting, separated relation, said upstanding separating panel having a double thickness portion at the top margin which is provided by folding over a marginal strip portion and securing the same to adjoining portions of said panel by latching tab members cut from said panel and having free edge portions positioned to overlie the margin at the free edge of said marginal strip portion.

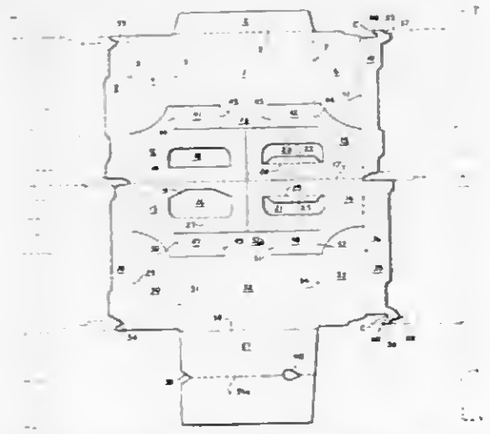
ARTICLE CARRIER

Prentice J. Wood, Hapeville, Ga., assignor to The Mead Corporation, Dayton, Ohio

Filed June 28, 1976, Ser. No. 700,227
Int. Cl.² B65D *5/48, 75/00, 81/00*
U.S. Cl. 206—173 **7 Claims**



1. An article carrier blank comprising a bottom wall, a first side wall foldably joined at a side edge of said bottom wall, a first pair of end wall panels foldably joined respectively to the end edges of said first side wall, a first pair of riser panels foldably joined respectively to said first pair of end wall panels along the edges thereof remote from said first side wall, a first pair of handle panels foldably joined along their outer end edges respectively to said first pair of riser panels, a second pair of handle panels foldably joined respectively to the top edges of said first pair of handle panels, a second pair of riser panels foldably joined respectively to said second pair of handle panels along the outer end edges thereof, a second pair of end wall panels foldably joined respectively to said second pair of riser panels along the inner edges thereof, a second side wall foldably joined respectively along the end edges thereof to the edges of said second pair of end wall panels remote from said second pair of riser panels, a pair of locking notches formed respectively in the riser panels at one end of the carrier blank, a pair of stabilizing tabs integral respectively with the riser panels at the other end of the carrier blank and each comprising a heel portion and a toe portion and a notch, said toe portions extending inwardly with respect to said blank and each of said notches opening inwardly with respect to said blank, said heel portions extending outwardly beyond the end edge of said blank at said other end of the carrier blank and adapted respectively to nest with the locking notches of an adjacent blank, and a locking aperture formed in said bottom wall, said adjacent blank being struck from the same sheet of material as said article carrier blank.

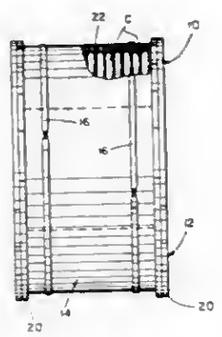
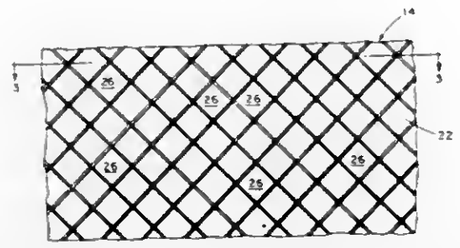
CABLE STORAGE PACKAGE

Laurie G. Mykleby, Palos Park, Ill., assigoor to Coronet Container, Lombard, Ill.

Filed Sept. 22, 1975, Ser. No. 615,473
Int. Cl.² B65D *85/67;* **B32B** *29/00*
U.S. Cl. 206—400 **6 Claims**





1. A flexible packing material comprising only a continuous outer flexible sheet, and a plurality of upright walls in closely adjacent relationship defining adjacent cells and each wall having a first edge and a second edge, said first edges only being rigidly secured to one surface of said outer flexible sheet so that portions of said walls secured to said sheet are substantially incompressible towards each other, and said second edges of said walls being movable towards and away from each other along said second edges.

4. A package for the storage of insulated multi-strand cable, said package comprising, in combination a rigid core, a pair of spaced flanges rigidly interconnected to said core in spaced relationship to each other, a cable receiving space defined between said flanges and on said core, cable being wound around the core between the flanges in said space, a flexible cable cover means for protecting said insulated cable, said cover means being wrapped around said cable and between said flanges, said cover means comprising only a continuous outer flexible sheet and a plurality of upright walls having a first edge and a second edge and defining a plurality of adjacent upright cells, said walls being secured to said sheet only along said first edge and not along said second edge and said second edge being positioned against the outer layer of said cable, and means for rigidly securing said cover around said cable.

4,029,207

CARRIER CARTON

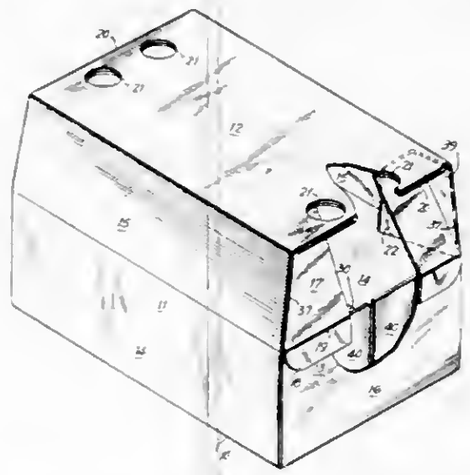
Robert L. Gordon, Monroe, N.Y., assignor to International Paper Company, New York, N.Y.

Filed Nov. 18, 1975, Ser. No. 632,929
Int. Cl.² B65D *65/12, 65/22, 5/46*
U.S. Cl. 206—427 **10 Claims**

1. A carrier carton, for packaging a plurality of similar articles, formed from an essentially flat blank of paperboard, comprising:

a. an opposed pair of end walls;
b. an opposed pair of side walls;

c. a top wall;
d. a bottom wall;
e. each of said walls being foldably connected along a score line with at least a portion of at least one other adjacent wall of said walls to form said essentially flat blank when said carton is in the unerected condition;
f. said top wall extending beyond at least the upper portion of the first of said end walls defining an eave-like projection of said top wall over said upper portion of said first end wall when said carton is in the erected condition;
g. said eave-like projection including an opening therethrough sufficiently large to accept a human finger, said opening passing essentially only through said projection whereby light is essentially prohibited from entering said



carton and said carton may be lifted by use of said opening, said eave-like projection being comprised of two layers of said paperboard wherein the lowermost layer of said two layers is formed from an extension of said top wall folded downwardly upon itself along a score line to define the lower surface of said eave-like projection; and
h. at least the first of said end walls including two flaps, a first of said flaps defining at least part of the upper portion of said first end wall, the second of said flaps defining at least part of the lower portion of said first end wall, said flaps meeting each other in said end wall, and one of said flaps including a pull tab connected with the end thereof by a score line, said pull tab overlying the other of said flaps and being adhesively secured thereto.

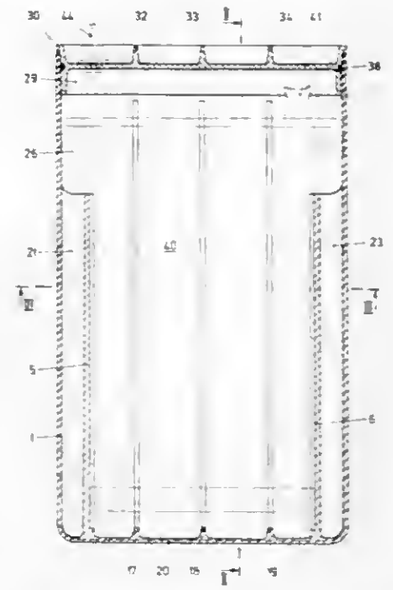
4,029,208

PACKAGING RECEPTACLE FOR PRINTED BOARDS

Hans Fickler, Winterthur, and Walter Frankhauser, Kusnacht, both of Switzerland, assignors to Aktiengesellschaft Fur Rationelle Verpackung, Affoltern a. A., Switzerland

Filed Dec. 1, 1975, Ser. No. 636,575
Claims priority, application Switzerland, Dec. 6, 1974, 16218/74; Nov. 10, 1975, 14539/75
Int. Cl.² A47G *19/08;* **A45C** *11/26;* **B65D** *85/54*
U.S. Cl. 206—454 **9 Claims**

1. A packaging receptacle for printed boards comprising: internal guide means for supporting at least one printed planar board and for restraining said board against displacement in the plane of the board and for affording lateral slideable play of said printed board perpendicular to the plane defined by the printed board, said internal guide means comprising a pair of spaced apart, generally parallel walls, a first groove in one of said walls for receiving a first edge of the board and a second groove in the other of said walls, opposite said first groove and for receiving a second edge of said board opposite said first edge, said grooves each having a bottom receiving said board thereagainst, the bottoms of said first and second



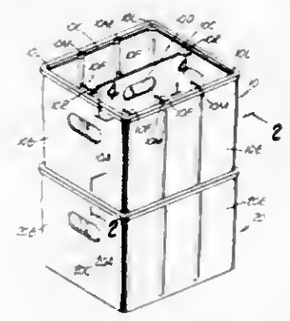
grooves being spaced apart by a dimension substantially equal to the width of said board.

4,029,209

STACKABLE CARRYING CASE

Carl E. Frahm, and Shirley E. Frahm, both of 133 Maple Ave., Monrovia, Calif. 91016

Filed May 3, 1976, Ser. No. 682,525
Int. Cl.² B65D *21/02, 25/04, 1/24*
U.S. Cl. 206—510 **6 Claims**



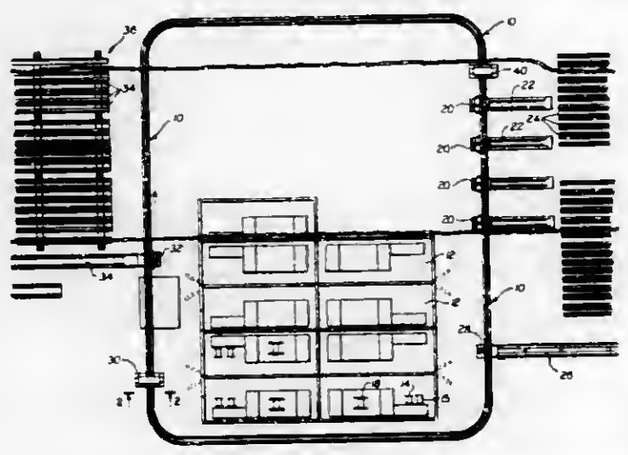
1. A generally rectangular stackable carrying case having a pair of end walls and a pair of side walls joined to said end walls; a center divider partition member extending between and joined to said end walls; said end walls and said side walls each being formed with an internal ledge portion; each of said ledge portions being joined to provide a continuous generally rectangular ledge located an equal distance below the top edge of each of said end and said side walls; said partition member being generally planar and extending (above the top edge) above said top edge of each of said end and side walls; said partition member terminating near the bottom of said case at an elevation above the bottom edges of said end and said side walls; said bottom edges of said end and said side walls terminating in a plane which is below the bottom of said partition member; means extending inwardly from said end and said side walls and forming a channel means with the lowermost portion of said partition member; said channel means being receptive to and serving as a guide means for the uppermost extending portion of a partition member of a like case, said uppermost extending portion cooperating with said channel means to guide movement of said case when said case is tilted upwardly from engagment with the ledge portions of

said end walls and is slid on the ledge portions of said side walls.

4,029,210
BOBBIN SPACER FOR CONVEYOR SYSTEM

Walter F. Thompson, and Dennis M. Redo, both of Somerville, N.J., assignors to General Cable Corporation, Greenwich, Conn.

Filed Sept. 10, 1975, Ser. No. 611,909
Int. Cl.² B07C 5/04
U.S. Cl. 209—82 15 Claims

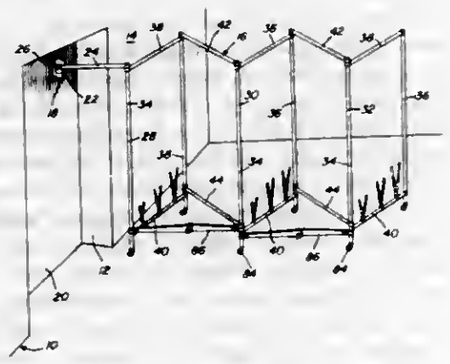


1. A bobbin conveyor for a wire making plant including in combination an endless belt conveyor on which the flanges of flanged bobbins are placed at a loading location for transfer to another location, said conveyor being of a width less than the diameter of the flanges of the bobbins, bobbin spacing apparatus at a station between the loading location and the other location, said bobbin spacing apparatus comprising means for contacting the flange of a trailing bobbin that is closer to a leading bobbin than a predetermined minimum distance lengthwise of the conveyor to hold said trailing bobbin from moving with the conveyor belt and to thereby increase the spacing of successive bobbins from one another, said means being located on opposite sides of the conveyor in positions over which bobbin flanges, projecting beyond the sides of the conveyor, travel as they move with the conveyor, and motion transmitting apparatus for moving said means into and out of the path of the bobbin flanges.

4,029,211
FOLDING CLOTHES RACK WITH STABILIZING HINGES AND SHOE SUPPORTS

Mary L. Marshall, 142 E. Wilkinson, Shreveport, La. 71104

Filed Feb. 12, 1974, Ser. No. 441,844
Int. Cl.² A47F 5/10
U.S. Cl. 211—104 1 Claim

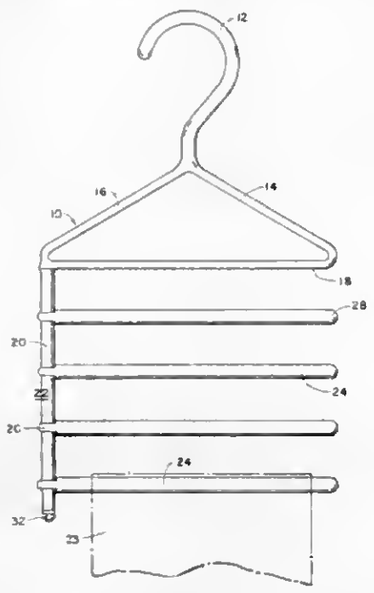


1. A folding clothes rack comprising at least two pairs of upright standards spaced along a horizontal zig-zag path, upper and lower generally horizontal brace members extending between and rigidly secured to the upper and lower ends of each pair of standards, a pair of upper and lower elongated and generally horizontal spacing and support members extending between upper and lower end portions of the adjacent standards, along said path, of said pairs of standards with the opposite ends of said spacing and support members anchored to said adjacent standards for relative displacement about the center longitudinal axes of said adjacent standards, and elongated articulated link means connected between adjacent pairs of standards with the link means connected at one end to one standard of a first pair of standards and at the other end to another standard spaced two standards along said path from said one standard, said articulated link means comprising a pair of link sections having one pair of ends pivotally secured together for relative angular displacement about a horizontal axis extending transversely of said link sections, the other pair of ends of said link sections including anchor portions pivotally secured thereto for oscillation about axes generally paralleling said horizontal axis and supported from said one standard and said second standard spaced therefrom at points adjacent but spaced above the lower ends thereof for angular displacement relative thereto about axes extending longitudinally therealong, said link sections being pivotally connected at said one pair of ends thereof for relative angular displacement of said link sections between first limit positions with said link sections generally paralleling each other in side-by-side upstanding relation with said other pair of ends thereof uppermost and second limit positions with said link sections disposed in generally end aligned relation, said anchor portions including partial cylindrical spring clamp members snap fittingly and rotatably engaged with said one standard and said second standard spaced therefrom.

4,029,212
CLOTHES HANGER

Ronald Uadiski, Box 17, Seward, Pa. 15954

Filed Mar. 4, 1976, Ser. No. 664,053
Int. Cl.² A47F 7/19
U.S. Cl. 211—113 7 Claims

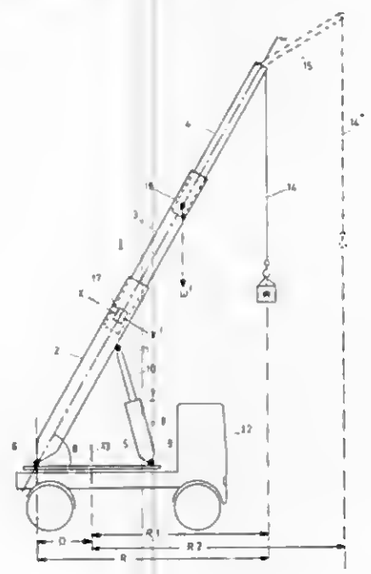


1. A clothes hanger adapted to support a plurality of articles of clothing, comprising a body portion having an upwardly extending hook means and depending therefrom a pair of diverging side sections, a base section integral with and engaging said side sections thereby forming a triangular body, one of said side sections having a downwardly extending substantially vertical side support section having a predetermined external diameter, a plurality of hollow internally threaded cylindrical spacer members having an internal diameter larger than the external diameter of said side support section and adapted to receive the same therethrough, a plurality of horizontally disposed clothing support members, each of said clothing support members terminating at one distal end in a ring member, said ring member having an internal diameter larger than the external diameter of said side support section, said ring member adapted to receive said support section in slidable and rotational engagement whereby said clothing support members are adapted to rotate 360° about said side support member, at least the distal end section of said side support member being externally threaded, internally threaded locking means adapted to engage said distal end section whereby said spacers and support members are retained in position.

4,029,213
CRANE LOAD INDICATING ARRANGEMENT

Willie Ellis Thompson, and Timothy John Archer Davis, both of Westcliff on Sea, England, assignors to Pye Limitrd, Cambridge, England

Filed Apr. 2, 1975, Ser. No. 564,307
Claims priority, application United Kingdom, Apr. 10, 1974, 15845/74
Int. Cl.² B66C 13/48
U.S. Cl. 212—39 MS 13 Claims



1. A crane load indicating arrangement for use with cranes having a boom which is pivoted at one end for luffing movement by a boom supporting means and is adapted to support a load at its other end, comprising measuring and reference circuits for providing an indication of the additional available lifting capacity a strain transducer adapted to be symmetrically mounted on the boom at a location for measuring only the shear stress in the boom but substantially independent of any bending stress in the boom at said boom location, the strain transducer supplying a first output signal to the measuring and reference circuits which is proportional to the shear stress produced in the boom by the weight of that part of the boom between the said location and the outer end of the boom, together with the shear stress produced by the weight of any load suspended at said outer end of the boom.

STOCK HANDLING APPARATUS

Andrew G. Benedict, Quakerstown; Thomas E. Marker, Wind Gap, both of Pa., and Herbert J. Schmidt, Glen Head, N.Y., assignors to MCP Facilities Corporation, Glen Head, N.Y.

Filed Sept. 2, 1975, Ser. No. 609,509
Int. Cl.² B65G 47/26
U.S. Cl. 214—1 P 9 Claims

1. Stock handling apparatus for temporarily storing and transporting bar stock including,

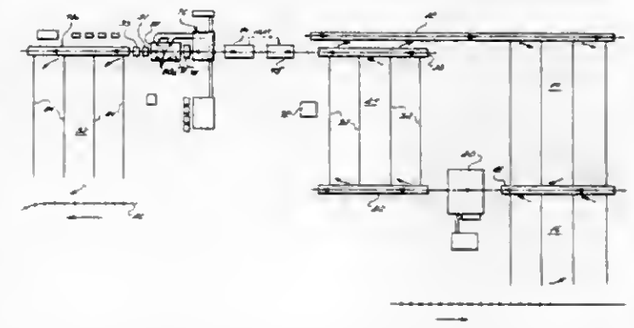
conveyor means to receive and transport the stock,

serial loader means including a plurality of loading spaces for serial loading a plurality of stock pieces, said loading spaces being defined between a plurality of fingers that are in a spaced configuration,

means to feed the stock to said serial loader means to be stored therein and positioned thereby in spaced configuration for concomitant movement therefrom, and

transport roller means having means to receive and position a plurality of stock pieces in spaced configuration as they are received in said loading spaces.

7. A method of handling bar stock during the coating thereof,



conveying the stock from a loading zone by means of a first conveyor,

feeding the stock onto an approach ramp,

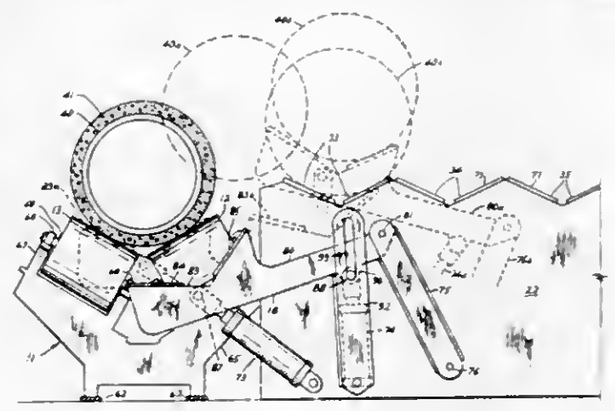
depositing the stock from the approach ramp onto a serial loader having a plurality of movable fingers and lifting the fingers in a sequential manner to load the stock pieces into the serial loader in a spaced array, and

moving the plurality of stock concomitantly from the loader so that said plurality of stock can be coated simultaneously.

4,029,215
PIPE HANDLING APPARATUS FOR PIPE LAYING BARGES

J. C. Birdwell, Houstoo, Tex., assignor to Midcoo Pipeline Equipment Co., Houston, Tex.

Division of Ser. No. 592,170, July 1, 1975, Pat. No. 3,984,007.
This application June 10, 1976, Ser. No. 694,885
The portion of the term of this patent subsequent to Oct. 5, 1993, has been disclaimed.
Int. Cl.² B65G 25/02, 47/82; B23Q 5/22
U.S. Cl. 214—1 P 11 Claims



1. Pipe lifter conveyor apparatus, comprising generally horizontally disposed bar means having pivotal connection means at one end thereof, pivot bar means disposed generally transversely downward from one end of said bar means having its upper end pivotally connected to said pivotal connection means of said bar means and having its lower end pivotally connected to a fixed support, upwardly facing pipe seat means at the other end of said bar means, first drive cylinder means pivotally connected to said bar means beneath said seat means

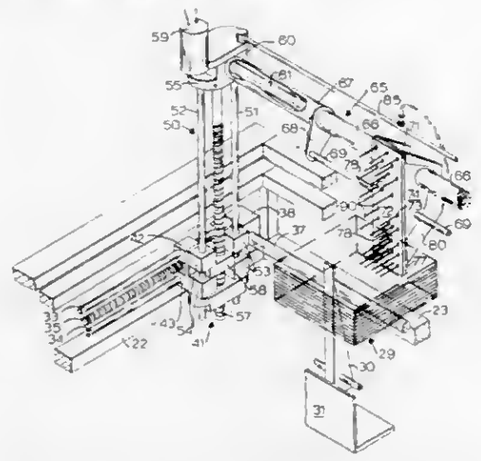
at its upper end and pivotally connected to a fixed support at its lower end for moving said bar means generally longitudinally in one direction and for raising and lowering said seat means to move said seat means between a first location and a second location, second drive cylinder means pivotally connected downwardly between an intermediate point of said bar means and a fixed support for lifting and supporting said seat means and for moving said bar means generally longitudinally in the other direction during its said movement between said first location and said second location.

4,029,216

METHOD AND APPARATUS FOR MOVING A STACK OF CORRUGATED SHEETS FROM A STACKER TO A DESIRED LOCUS

Clifton G. Adams, Baldwin Park; Carl B. Dallas, Buena Park, and George E. Coltrin, El Monte, all of Calif., assignors to Georgia-Pacific Corporation, Portland, Oreg.

Filed May 7, 1975, Ser. No. 575,204
Int. Cl.² B65G *47/90*
U.S. Cl. 214—1 BB **17 Claims**



1. An apparatus for relocation of a stack of corrugated board sheets aligned to expose on a side of said stack a series of many end openings for each said sheet formed by the corrugations thereof, the combination of:

an upright plate defining multiple series of horizontal perforation therethrough, one series having a multiplicity of said perforations being alignable with some of a said series of end openings of the bottom sheet of said stack and other of said series of perforations then being aligned with end openings of other sheets dispersed over said side of said stack,

pin-supporting means supporting multiple series of horizontal pins, each being sized and positioned in relation to a said perforation and a said end opening for movement therethrough and for an effective distance beyond said perforation and into said opening for use in lifting said stack in cooperation with said other pins.

lift means supporting said pin-supporting means, for lifting a stack into which said pins have been inserted, and

pin projecting and retracting means attached to said pin-supporting means for extending said series of pins through said plate and into a said stack and for retracting said pins from said stack.

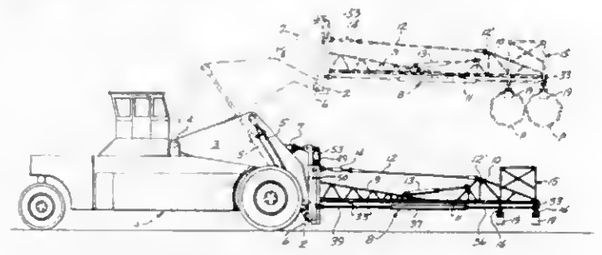
4,029,217

PIPE-HANDLING CRAMPON

Charles Richard Morse, P.O. Box 1561, Anchorage, Alaska 99510

Filed Jan. 15, 1975, Ser. No. 541,264
Int. Cl.² B65G *41/00*
U.S. Cl. 214—1 P **26 Claims**

1. A length-handling crampon for a lift truck having a boom projecting from and supported by the lift truck, comprising an elongated length-spanning frame carried by the boom with its length extending transversely of the length of the boom and its opposite end portions projecting substantial distances beyond opposite sides of the boom, powered frame-carrying means for



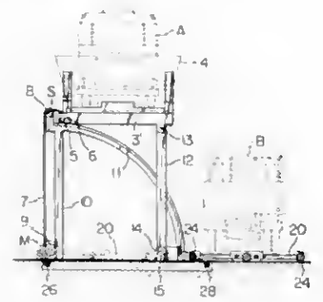
moving said length-spanning frame transversely of its length along the boom toward and away from the lift truck, and remotely actuated power gripping means carried by said frame and engageable with a length to be handled for gripping such length.

4,029,218

TWO-STORIED PARKING APPARATUS FOR AUTOMOBILES

Takashi Matsuura, 28-4, Izumi 2-chome, Suginami, Tokyo, Japan

Filed Feb. 21, 1975, Ser. No. 551,770
Int. Cl.² E04H *6/06*
U.S. Cl. 214—16.1 R **6 Claims**



1. An elevated parking apparatus for automobiles, comprising:

a pair of frames stationarily fixed to and projecting upwardly from the ground, said frames being spaced from one another;

said pair of frames defining a pair of substantially parallel, arcuate guide rails fixedly associated with the respective frames, each said guide rail defining thereon an arcuate guide surface disposed substantially within a vertical plane, one end of said guide surface being disposed closely adjacent the ground, the other end of said guide surface being spaced vertically upwardly a substantial distance above the ground and horizontally offset with respect to said one end;

pulley means rotatably supported on each of said frames adjacent the upper end of the respective arcuate guide rail;

an upper pallet adapted to have a vehicle positioned and supported thereon, said pallet extending between said frames and having a pair of roller means mounted thereon and disposed in rolling engagement with said pair of guide rails, whereby said roller means rollingly engage said arcuate guide surfaces, said roller means being rotatably supported on said pallet adjacent one edge thereof;

a pair of elongated support members having the lower ends thereof pivotally connected to and supported adjacent the ground so that said support members are swingably movable within vertical planes which are substantially parallel to the vertical planes defined by said arcuate guide surfaces, each of said support members being positioned in the vicinity of one of said frames, said support members having the upper ends thereof pivotally connected to said pallet at a location thereon spaced sidewardly from said roller means, said location being disposed more closely adjacent the opposite edge of said pallet, said frames and said supporting members maintaining said pallet in a substantially horizontal orientation at all times;

drive means for moving said pallet between a lowered position wherein the pallet is disposed adjacent the ground for permitting a vehicle to be positioned on or removed from the pallet and an elevated position wherein the pallet is disposed vertically upwardly a substantial distance above said ground, said drive means including a drive motor stationarily mounted with respect to said frame and positioned adjacent the ground, and a pair of elongated flexible cables having the lower ends thereof connected to said drive motor, said cables passing upwardly from said drive motor and over said pulley means so that the other ends of said cables are connected to said pallet;

auxiliary force means coacting directly with said support members to assist in controlling the swinging movement of said support members when said pallet is being raised or lowered, said auxiliary force means including fluid pressure cylinder means interconnected to said support members for controlling the swinging movement thereof; and

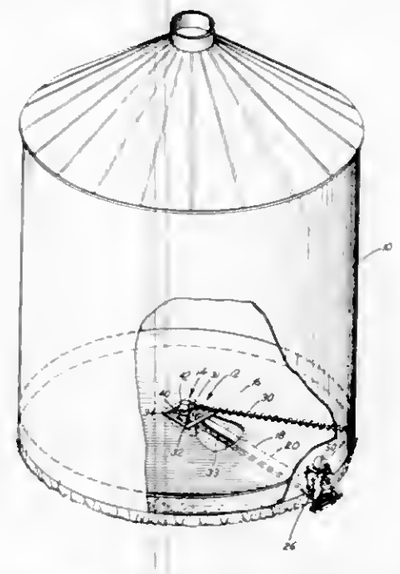
said pallet when in said elevated position having the weight thereof supported solely by said frames and said pair of elongated support members, said pallet when being moved between said elevated and lowered positions being constrained for movement along a preselected path due to said roller means being disposed in rolling engagement with said arcuate guide surfaces simultaneous with the vertical swinging movement of said support members between a position wherein they extend substantially vertically upwardly when the platform is in said elevated position and a position wherein they project substantially horizontally and are disposed closely adjacent the ground when the platform is in said lowered position.

4,029,219

BOTTOM GRAIN UNLOADER

Donald E. Rutten, Plainfield, and Richard A. Davis, Joliet, both of Ill., assignors to P & D Manufacturing Co., Inc., Plainfield, Ill.

Filed Dec. 17, 1975, Ser. No. 641,509
Int. Cl.² B65G *65/46*
U.S. Cl. 214—17 DA **4 Claims**



1. An improved auger discharge construction for removal of material from the bottom of a bin, comprising, in combination:

a hopper at the bottom of the bin substantially at the center thereof;

a removal tube extending from the hopper to outside the bin;

a removal auger in the removal tube having a shaft;

drive means outside the bin;

a first drive linkage from the drive means drivably connected to the shaft of the removal auger;

a sweep auger extending from the hopper into the bin;

a sweep auger drive shaft from the hopper to outside the bin;

gear means in the hopper connecting the drive shaft to the sweep auger;

a second drive linkage from the removal auger shaft drivably connected to the sweep auger drive shaft, including a drive sprocket keyed to the sweep auger drive shaft, an idler sprocket on the removal auger shaft free-wheeling therefrom, and a drive chain connecting the idler sprocket with the drive sprocket; and

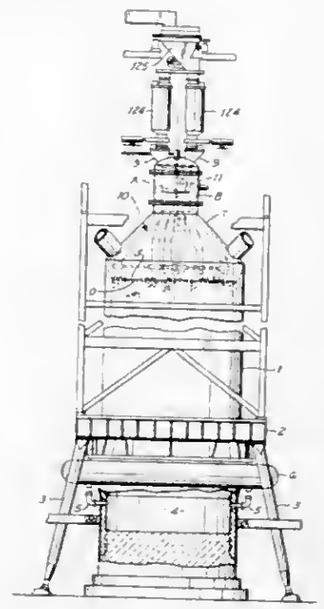
a clutch intermediate the first drive linkage and the second drive linkage, including a driven clutch member unitary with the idler sprocket and a driving clutch member slidable longitudinally along the axis of the discharge auger shaft and keyed for rotation therewith, said driving clutch member having a circumferential slot around the periphery, and a clutch drive arm having opposed members with opposed pins which extend into the circumferential slot of the driving clutch member, said clutch drive arm for sliding the driving clutch member into and out of engagement with the driven clutch member.

4,029,220

DISTRIBUTOR MEANS FOR CHARGING PARTICULATE MATERIAL INTO RECEPTACLES

Melvin J. Greaves, 9995 Cliff Drive, Cleveland, Ohio 44102

Filed Nov. 28, 1975, Ser. No. 636,165
Int. Cl.² F23K *3/18*
U.S. Cl. 214—35 R **20 Claims**



1. Apparatus for charging particulate charge material into a receptacle, comprising a receptacle adapted to have particulate charge material deposited therein in a body having an upwardly facing stock line; and charge distributing means for distributing charge material in said receptacle, said charge distributing means being rotatable about an upright axis and comprising hopper means rotatable about said axis and having an upper portion adapted to have charge material discharged therein and having at its lower portion a plurality of discharge

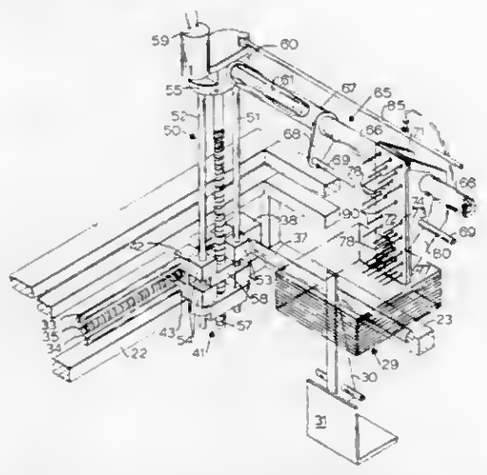
at its upper end and pivotally connected to a fixed support at its lower end for moving said bar means generally longitudinally in one direction and for raising and lowering said seat means to move said seat means between a first location and a second location, second drive cylinder means pivotally connected downwardly between an intermediate point of said bar means and a fixed support for lifting and supporting said seat means and for moving said bar means generally longitudinally in the other direction during its said movement between said first location and said second location.

4,029,216

METHOD AND APPARATUS FOR MOVING A STACK OF CORRUGATED SHEETS FROM A STACKER TO A DESIRED LOCUS

Clifton G. Adams, Baldwin Park; Carl B. Dallas, Buena Park, and George E. Coltrin, El Monte, all of Calif., assignors to Georgia-Pacific Corporation, Portland, Oreg.

Filed May 7, 1975, Ser. No. 575,204
Int. Cl.² B65G 47/90
U.S. Cl. 214—1 BB 17 Claims



1. An apparatus for relocation of a stack of corrugated board sheets aligned to expose on a side of said stack a series of many end openings for each said sheet formed by the corrugations thereof, the combination of:

an upright plate defining multiple series of horizontal perforation therethrough, one series having a multiplicity of said perforations being alignable with some of a said series of end openings of the bottom sheet of said stack and other of said series of perforations then being aligned with end openings of other sheets dispersed over said side of said stack,

pin-supporting means supporting multiple series of horizontal pins, each being sized and positioned in relation to a said perforation and a said end opening for movement therethrough and for an effective distance beyond said perforation and into said opening for use in lifting said stack in cooperation with said other pins.

lift means supporting said pin-supporting means, for lifting a stack into which said pins have been inserted, and

pin projecting and retracting means attached to said pin-supporting means for extending said series of pins through said plate and into a said stack and for retracting said pins from said stack.

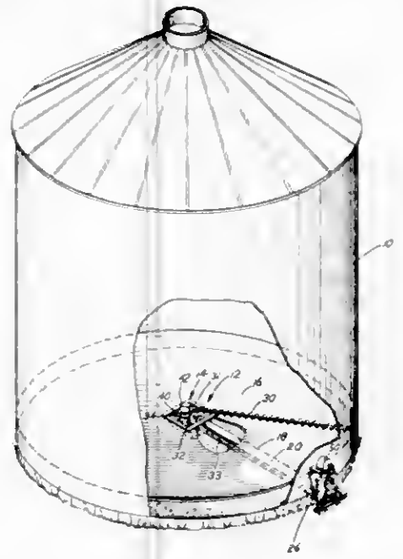
BOTTOM GRAIN UNLOADER

Donald E. Rutten, Plainfield, and Richard A. Davis, Joliet, both of Ill., assignors to P & D Manufacturing Co., Inc., Plainfield, Ill.

Filed Dec. 17, 1975, Ser. No. 641,509
Int. Cl.³ B65G 65/46
U.S. Cl. 214—17 DA 4 Claims



1. An improved auger discharge construction for removal of material from the bottom of a bin, comprising, in combination:

a hopper at the bottom of the bin substantially at the center thereof;

a removal tube extending from the hopper to outside the bin;

a removal auger in the removal tube having a shaft;

drive means outside the bin;

a first drive linkage from the drive means drivably connected to the shaft of the removal auger;

a sweep auger extending from the hopper into the bin;

a sweep auger drive shaft from the hopper to outside the bin;

gear means in the hopper connecting the drive shaft to the sweep auger;

a second drive linkage from the removal auger shaft drivably connected to the sweep auger drive shaft, including a drive sprocket keyed to the sweep auger drive shaft, an idler sprocket on the removal auger shaft free-wheeling therefrom, and a drive chain connecting the idler sprocket with the drive sprocket; and

a clutch intermediate the first drive linkage and the second drive linkage, including a driven clutch member unitary with the idler sprocket and a driving clutch member slidable longitudinally along the axis of the discharge auger shaft and keyed for rotation therewith, said driving clutch member having a circumferential slot around the periphery, and a clutch drive arm having opposed members with opposed pins which extend into the circumferential slot of the driving clutch member, said clutch drive arm for sliding the driving clutch member into and out of engagement with the driven clutch member.

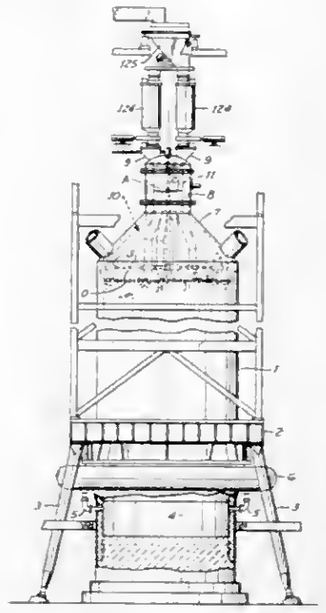
DISTRIBUTOR MEANS FOR CHARGING PARTICULATE MATERIAL INTO RECEPTACLES

Melvin J. Greaves, 9995 Cliff Drive, Cleveland, Ohio 44102

Filed Nov. 28, 1975, Ser. No. 636,165
Int. Cl.² F23K 3/18
U.S. Cl. 214—35 R 20 Claims



1. Apparatus for charging particulate charge material into a receptacle, comprising a receptacle adapted to have particulate charge material deposited therein in a body having an upwardly facing stock line; and charge distributing means for distributing charge material in said receptacle, said charge distributing means being rotatable about an upright axis and comprising hopper means rotatable about said axis and having an upper portion adapted to have charge material discharged therein and having at its lower portion a plurality of discharge

chutes rigidly fixed to said hopper means, and being adapted to have charge material flow from said hopper means through said chutes, each of said chutes having an upper entrance opening and a lower discharge portion that moves in a circular path concentric with and transverse to said axis of rotation as said charge distributor means rotates, the discharge portions of said plurality of chutes being located so they discharge material in concentric generally circular zones that have predetermined areas of essentially the same cross-sectional areas and that are radially offset in the receptacle so that the material discharged from said discharge portions is discharged over at least a major portion of cross section to said stock line, and means between said hopper means and the entrance openings of said chutes for dividing charge material discharged into said chutes into portions that pass into said chutes and are proper to fill said areas of said circular zones as said hopper means rotates.

4,029,221

METHOD AND APPARATUS FOR FEEDING A CIGARETTE TRAY TRANSPORTING VEHICLE

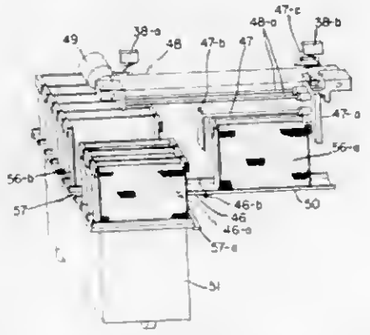
Saburo Nakai, and Nobuyuki Koyama, both of Tokyo, Japan, assignors to The Japan Tobacco & Salt Public Corporation, Tokyo, Japan

Filed Sept. 2, 1975, Ser. No. 609,680

Claims priority, application Japan, Aug. 30, 1974, 49-103356[U]

Int. Cl.² B65G *67/28*

U.S. Cl. 214—38 BB **6 Claims**



1. In an apparatus for loading and unloading cigarette trays with cigarettes from a cigarette manufacturing machine comprising:

a. a plurality of cigarette tray transporting vehicle means for carrying a plurality of said cigarette trays, said vehicle means including a plurality of feed pins, each feed pin corresponding to one of said plurality of cigarette trays and drive means for moving said vehicle means;

b. a feeding means for feeding said cigarette trays between said vehicle means and said cigarette manufacturing machine, said feeding means including feed pawl means for engaging said feed pins and moving said vehicle means relative to said manufacturing machine, and pusher means for transferring said cigarette trays between said vehicle means and said cigarette machine;

c. first sensor means for sensing the transfer of a full cigarette tray from said machine to said vehicle means and for operating said feed pawl means to engage one of said feed pins and move said feed pin a distance equal to the distance between adjacent feed pins, whereby said vehicle means is moved said distance;

d. second sensor means for sensing the movement of said feed pawl means and for operating said pusher means, thereby transferring a succeeding cigarette tray from said vehicle means to said cigarette machine; and

e. third sensor means for sensing the filling of said succeeding cigarette tray and for operating said pusher, thereby transferring said full succeeding cigarette tray from said cigarette machine back to said vehicle means, whereby all of said plurality of cigarette trays on one of said vehicle means are successively automatically filled, said first, second and third sensor means each including a cam and a corresponding cam operated switch;

the improvement comprising:

f. fourth sensor means for sensing one of said vehicle means at a first predetermined position and for operating the drive means of the succeeding vehicle means to move said succeeding vehicle means to a second predetermined position;

g. fifth sensor means for sensing the arrival of said succeeding vehicle means at said second predetermined position and for deenergizing said drive means thereof; and

h. sixth sensor means for sensing when the last cigarette tray of said one vehicle means is full and for energizing said drive means thereof, whereby said one vehicle means moves away from said feeding means, said fourth, fifth and sixth sensor means including magnetic sensors.

4,029,222

APPARATUS FOR LOADING SHEET MATERIAL ON A PLURALITY OF SHELVES ON A BOOK TRUCK

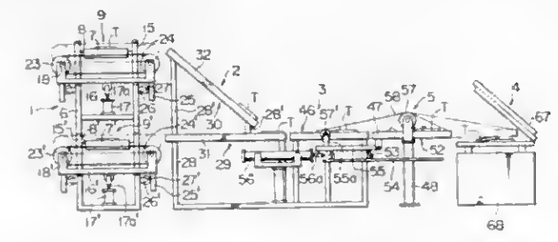
Eizi Yano, Higashimurayama; Shunjiro Ohkawa, Iruma; Tadaaki Komatsu, Akigawa, and Masami Adachi, Higashimurayama, all of Japan, assignors to Bridgestone Tire Company Limited, Tokyo, Japan

Filed Apr. 21, 1975, Ser. No. 570,163

Claims priority, application Japan, Apr. 30, 1974, 49-49195; Apr. 30, 1974, 49-49196; June 21, 1974, 49-71680

Int. Cl.² B65G *67/04*

U.S. Cl. 214—41 R **11 Claims**



1. An apparatus for loading sheet materials on a plurality of shelves piled on a book truck comprising:

a loading mechanism including conveyor means movable toward and away from the upper surface of each of said shelves on said truck, actuator means for moving said conveyor means toward and away from the upper surface of each of said shelves, and a driving unit including an endless member for drivable engagement with said conveyor means, a drive source for driving said endless member, a one-way clutch member passed on by said endless member, and a movable frame connected to said conveyor means and supporting said clutch member so that when said conveyor means is moved away from the upper surface of each of said shelves by said actuator means, said drive source is not driven and said one-way clutch member is disengaged to drive said conveyor means relatively to said sheet materials to transfer said sheet materials onto each of said shelves and when said conveyor means is moved toward the upper surface of each of said shelves by said actuator means, said drive source is driven and said one-way clutch member is engaged so as not to drive said conveyor means relative to said sheet materials;

a waiting mechanism adjacent an end of said loading mechanism remote from said book truck for conveying said sheet materials onto said loading mechanism when said loading mechanism has no sheet material thereon and for holding said sheet materials thereon when said loading mechanism has said sheet materials thereon; and

a lining-up mechanism adjacent an end of said waiting mechanism remote from said loading mechanism for lining up said sheet materials and conveying said sheet materials onto said waiting mechanism.

4,029,223

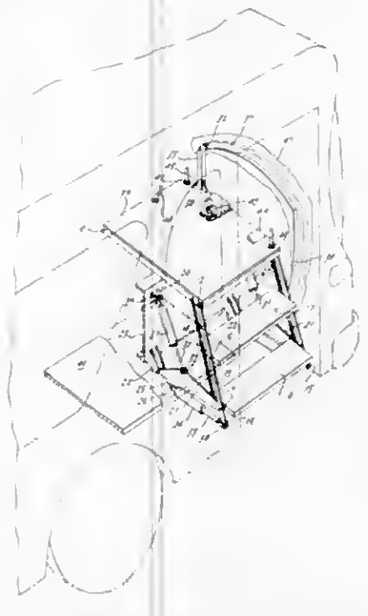
BUS LOADER

Donald F. Adamski, Danville, and David M. Anderson, Lafayette, both of Calif., assignors to MB Associates, San Ramon, Calif.

Filed July 25, 1975, Ser. No. 599,063

Int. Cl.² B60P *1/48*

U.S. Cl. 214—77 R **10 Claims**



1. In a bus loader, a platform, a movable support for said platform located in the entrance way at the front of the bus after the steps were removed therefrom, means actuating said movable support to raise the platform from the ground and advance it forwardly onto the floor of the bus, upper and lower step plate means at the underside of the platform and connected thereto and movable to step loading position as the platform is moved from the ground to the position within the bus, said bus having a frame member at the side, brackets secured to the bottom of said frame member, operating arms pivoted on said brackets, pivot means securing the opposite ends of the operating arms to the lower step plate means, a pair of rams pivoted to brackets at the upper part of said frame member and the operating arms for raising said platform from the ground upwardly adjacent to the plane of the bus floor.

4,029,224

TAILGATE FOR A REAR LOADING REFUSE VEHICLE

William A. Herpich; George W. Palmer, both of Galion, and Francis H. Pittenger, Shelby, all of Ohio, assignors to Peabody International Corporation, Galion, Ohio

Filed May 24, 1976, Ser. No. 689,082

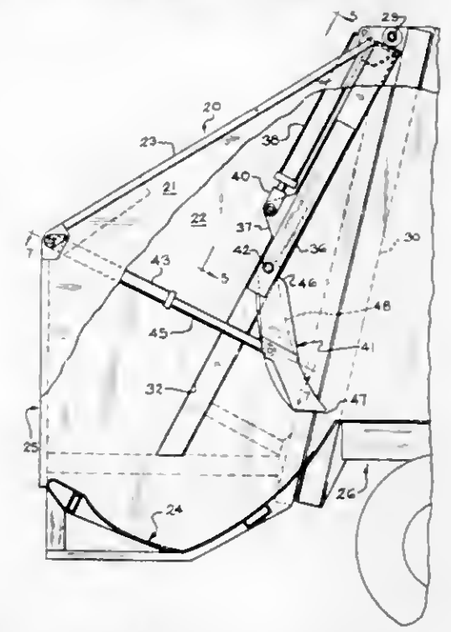
Int. Cl.² B65F *3/00*

U.S. Cl. 214—83.3 **15 Claims**

11. In a tailgate for a rear loading refuse vehicle said tailgate having parallel, spaced side walls and a hopper-like bottom, and having a packer blade and a mechanism for actuating said packer blade comprising upwardly and forwardly inclined guide tracks in said side walls, packer blade support means extending across said tailgate and including elements reciprocable in said guide tracks, a generally rectangular packer blade extending across said tailgate that is pivoted at its upper horizontal edge to said support means, the improvement comprising, in combination,

a. first hinge elements at the upper front corner of said tailgate and second cooperating hinge elements at the upper rear corner of the body of said vehicle,

b. a pair of hydraulic packing cylinders and piston rods the bases of said cylinders being pivotally mounted on the first said elements and extending therefrom downwardly along the associated one of said guide tracks with each of said rods being pivotally connected at its lower end to said packer blade support means, and



c. a pair of hydraulic sweep cylinders and piston rods, said rods being pivotally connected at their lower ends to said packer blade for swinging said packer blade angularly relative to said support means.

4,029,225

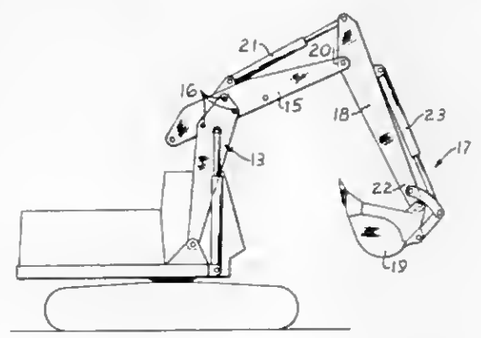
BOOM-STICK ADAPTER FOR TWO-PIECE BOOM

Leon A. Wirt, Joliet, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.

Filed Apr. 16, 1976, Ser. No. 677,575

Int. Cl.² E02F *3/32*

U.S. Cl. 214—138 R **9 Claims**



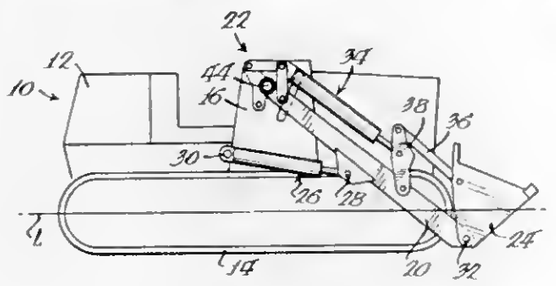
1. In a material handling apparatus having a stub boom provided with means for connecting a fore boom thereto to form a two-piece boom, means for selectively swingably positioning the stub boom about a first axis, and a work implement, an improved joint means for swingably connecting the work element to said stub boom comprising: an adapter having a mounting portion and a joint portion; first mounting means cooperating with said stub boom connecting means for mounting said adapter mounting portion to said stub boom; second mounting means swingably mounting said adapter joint portion to said mounting portion to pivot about an axis parallel to said first axis; third mounting means fixedly mounting said work element to said adapter joint portion; and positioning means mounted to said stub boom and connected to said adapter joint portion for selectively swingably positioning said portion relative to said mounting portion for selectively positioning the work element.

4,029,226

LINKAGE SUPPORT SYSTEM FOR MATERIAL HANDLING UNIT

David H. Seaberg, Davenport, Iowa, assignor to J. I. Case Company, Racine, Wis.

Filed Apr. 12, 1976, Ser. No. 675,992
Int. Cl.² E02F 3/70
U.S. Cl. 214—139 4 Claims



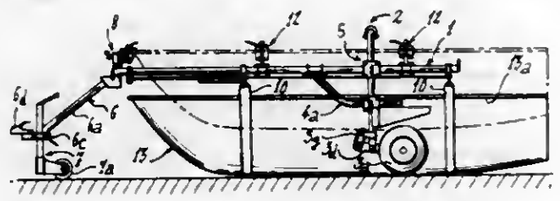
1. In a material handling implement including a vehicle body, a boom pivotally supported on one end on said body with a boom fluid ram between said body and boom for pivoting said boom and a material handling unit pivoted on a free end of said boom by a unit fluid ram, the improvement comprising an arm supported on said body by a first pivot with said boom supported on said arm by a second pivot spaced from said first pivot; linkage means including first and second links pivotally interconnected at one end, said first link having an opposite end connected to said arm by a third pivot spaced from said first and second pivots and said second link having an opposite end connected to said boom at a location spaced from said second pivot, said unit fluid ram including a first element pivotally connected to said one end of said first and second links and a second element operatively connected to said material handling unit; and guide means between said body and said boom for guiding said boom during pivotal movement thereof, said guide means and pivots being positioned to pivot said arm between first and second extreme pivoted positions with said material handling unit being moved toward said vehicle as said arm is moved from said first extreme position toward said second extreme position, said arm being in said second extreme position when said boom is at an intermediate position generally parallel to a longitudinal axis of said vehicle body to minimize the moment arm for said boom at said intermediate position, said links being configured to maintain said material handling unit generally at the same angular attitude as said boom is moved from an extreme lower position to an extreme raised position.

4,029,227

ROAD TRAILER FOR TRANSPORTING A BOAT

Jacques Martinez, Fresnes, France, assignor to Agence Nationale de Valorisation de la Recherche (ANVAR), Neuilly-sur-Seine, France

Filed Apr. 22, 1975, Ser. No. 570,473
Claims priority, application France, Apr. 25, 1974, 74.14501
Int. Cl.² B60P 3/10
U.S. Cl. 214—396 4 Claims



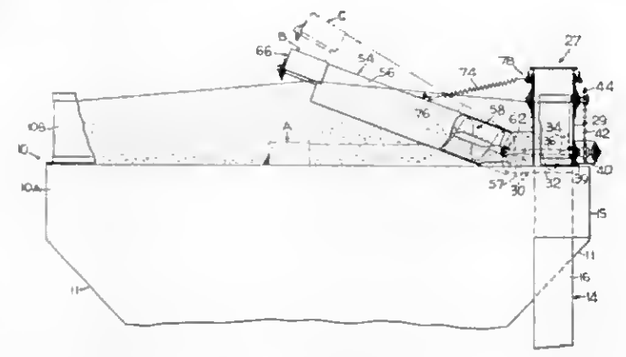
1. A vehicle of the road trailer type for handling, displacing and transporting a load such as a boat which has a peripheral edge, said vehicle comprising a structure adapted to be placed above the load and to surround it, said structure comprising at least one longitudinal frame element having at least two side-members interconnected at their forward ends by means of at least one cross-member and also interconnected by at least one transverse frame element which in use is above the load, gripping means disposed at intervals along the length of said longitudinal frame element and capable of gripping the edge of the load, means on said vehicle for lifting the load, the last-named means being mounted on a said frame element, at least one wheel system for the vehicle mounted on a said transverse frame element, means for modifying the width of the longitudinal frame element as a function of the width of the load, and means for displacing the transverse frame element with respect to the longitudinal frame element and with respect to itself so as to accommodate loads of various lengths and widths.

4,029,228

SELF-RAISING BIN LOADING AUGER FOR COMBINES

J. Lyle Shaver, Blue Springs, Mo., assignor to Allis-Chalmers Corporation, Milwaukee, Wis.

Filed Sept. 26, 1975, Ser. No. 617,101
Int. Cl.² B60P 1/40
U.S. Cl. 214—522 2 Claims



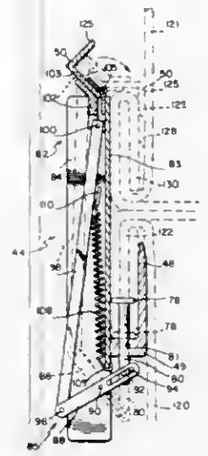
1. In combination, a grain storage tank means adapted to be mounted on an agricultural combine, an elevating conveyor adapted to deliver grain to an upper portion of said storage tank means, a grain conveyor positioned contiguous but beneath the upper end of said storage tank means, said grain conveyor comprising an auger tube and an auger conveyor mounted for rotation in said auger tube, said auger tube being adapted to receive grain discharged by said elevating conveyor and to convey grain thus received to a substantially downwardly directed discharge outlet of said auger tube in overlying relation to the interior of said storage tank means, a drive means for said auger conveyor, said auger conveyor being rotatably drivingly connected to said drive means through a universal connecting means whereby said auger conveyor remains connected in driven relation to said drive means at changing angular positions of said auger tube relative to the horizontal plane, and support means supporting said auger tube for pivotal movement about a horizontal axis coincident with the center of said universal connecting means, the reaction force of the grain being discharged from said substantially downwardly directed discharge outlet of said auger tube against the upper surface of the already loaded grain in said storage tank means urging said auger tube to swing upwardly about its horizontal pivotal axis and thus to cause at least the discharge end of said auger tube to always float on the upper surface of the already loaded grain in said storage tank means when the level of grain in said storage tank means exceeds a predetermined level.

4,029,229

LIFT BLADE APPARATUS

Lloyd L. Hobson, 312 N. East St., Elnora, Ind. 47529

Filed Feb. 23, 1976, Ser. No. 660,336
Int. Cl.² B66F 9/18
U.S. Cl. 214—654 10 Claims



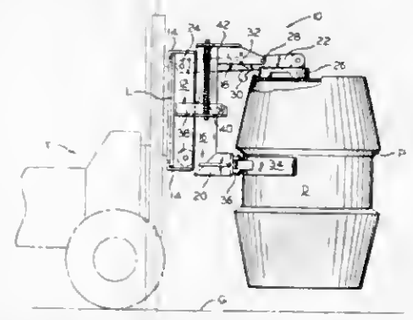
1. In a lift truck an apparatus for lifting at least two vertically stacked top and bottom containers, said apparatus comprising a lifting blade for engaging the bottom container, the improvement comprising a second blade disposed upwardly from said lifting blade for engaging said top container, means for sensing the engagement of said lifting blade with the bottom container in said stack in response to vertical movement of the lifting blade relative to said bottom container, and transmitting means for operatively connecting said sensing means to said second blade for causing said second blade to engage said top container for clamping said two containers securely in stacked relationship to lift them together.

4,029,230

DRUM HANDLING ATTACHMENT

Wayne J. Bolduc, Claymont; Vernon E. Cave, Newark, both of Del., and Edward J. Chase, San Pedro, Calif., assignors to Container Corporation of America, Chicago, Ill.

Filed May 21, 1976, Ser. No. 688,754
Int. Cl.² B66F 9/18
U.S. Cl. 214—654 7 Claims



1. In an attachment mounted for movement on a lift of a lift truck, or the like, said attachment comprising:

a. a mounting bracket secured to said lift and movable therewith;

b. a frame member operatively connected to said mounting bracket and having upper and lower horizontal extensions;

c. an arm having one of its ends pivotally mounted on said mounting bracket and having:

i. a first article engaging element movably secured to the opposite end of said arm;

ii. a pin member pivotally connecting said arm to said frame member at said upper horizontal extension;

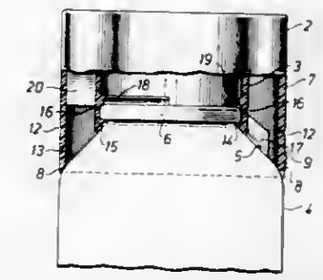
d. a second article engaging element secured to said lower horizontal extension.

4,029,231

PILFERPROOF CLOSURE FOR BOTTLES, TUBES AND SIMILAR CONTAINERS

Knut Johan Vilhelm Jonsson, Kungalv, Sweden, assignor to AB Wicanders Korkfabriker, Alvangen, Sweden

Filed Nov. 20, 1975, Ser. No. 633,788
Claims priority, application Sweden, Nov. 21, 1974, 7414621; May 9, 1975, 7505380
Int. Cl.² B65D 41/32
U.S. Cl. 215—256 7 Claims



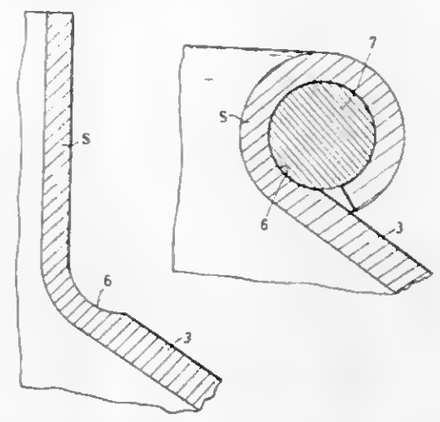
1. A pilferproof closure for bottles, tubes and similar containers, having an opening at its top surrounded by a retaining rim, comprising a cap having an inner skirt adapted for repeated sealing of the opening provided with inwardly directed projections to engage with said retaining rim, an outer skirt surrounding said inner skirt and adapted to extend about said inner skirt when said cap is initially closed on said container to prevent movement of said inner skirt permitting the disengagement of said projections with said rim, said inner and outer skirts being provided with detachable sections along the free edges thereof, means for permanently connecting said detachable sections, and an enervation line at a distance from the free edge of the inner skirt arranged to permit said detachable section to be torn from the inner skirt on detachment of the outer skirt.

4,029,232

SINGLE-PIECE ALUMINIUM CONTAINER FOR AEROSOLS

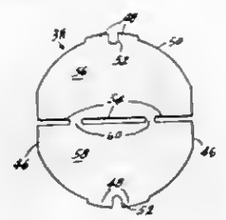
Carlo Maniá, Milan, Italy, assignor to Broggi-Izar Fabbriche Italiane Riunite S.p.A., Milan, Italy

Filed Nov. 18, 1975, Ser. No. 632,895
Claims priority, application Italy, Nov. 25, 1974, 29782/74
Int. Cl.² B65D 7/42
U.S. Cl. 220—73 5 Claims



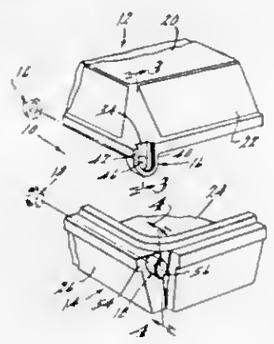
1. In a single-piece aluminum container for aerosols having a body and a mouth formed by curling the container edge the improved mouth construction wherein the edge is curled around and in contact with a reinforcing ring and wherein the thickness of the curled edge is less than the thickness of the adjoining metal.

4,029,233
SONOBUOY RETAINER PLATE
James W. Widenhofer, Jackson, Mich., assignor to Sparton Corporation, Jackson, Mich.
Division of Ser. No. 345,871, March 29, 1973, Pat. No. 3,921,120. This application Sept. 12, 1975, Ser. No. 612,698
Int. Cl.² B63D 21/00; H04B 11/00
U.S. Cl. 220—89 A 3 Claims



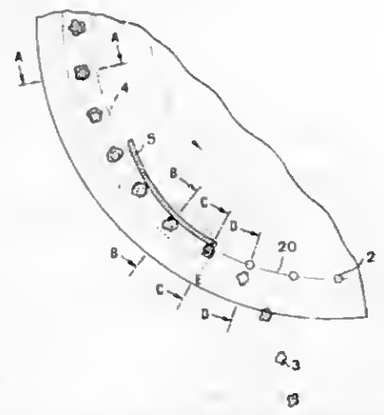
1. A retainer plate for a sonobuoy comprising a generally planar body member of deformable material having a generally circular periphery, a pair of locking tabs radially extending from said body periphery located at substantially diametrically opposed locations on said body member, and a weakened hinge line defined on said body member intermediate said locking tabs facilitating and controlling deformation of said body member upon a deforming force being applied to said body member transverse to the general plane thereof, said hinge line being diametrically defined on said body member on a diameter transversely related to a diameter intersecting said locking tabs, said hinge line comprises at least one elongated opening diametrically defined in said body member defining hinge portions of the material of said body member, the length of said opening being substantially perpendicular to a diameter intersecting said locking tabs.

4,029,234
PLASTIC HINGE CONSTRUCTION
Edward M. Johnson, Jr., Matteson, Ill., and John T. Stone, Saylorsburg, Pa., assignors to The Triangle Corporation, Grant Park, Ill.
Filed Sept. 10, 1976, Ser. No. 721,935
Int. Cl.² B65D 43/16, 25/18; B29C 17/07, 11/00
U.S. Cl. 220—337 9 Claims



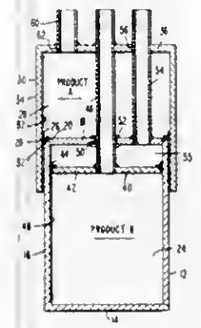
1. A plastic blow molded container blow molded from an extruded, hollow parison of thermoplastic material and including a lid and a base and being connected together for relative pivotal movement by a hinge structure, with each of the lid and base having side walls, said hinge structure comprising:
a pin structure molded integrally with one of the lid and base, and a journal structure molded integrally with the other of the lid and the base, said pin structure being rotatably supported by said journal structure,
said pin structure comprising a generally solid pair of pin members each having a generally circular cross-section and being formed by the compression molding of the material generally from a double wall of the parison to form said circular cross-section, said pin members being axially aligned and extending axially outwardly from opposite first side walls, each of said first side walls having a first indented portion with the associated ones of said pins extending outwardly from said first indented portion whereby said one pin terminates proximately within the confines of said first indented portion,
said journal structure comprising a pair of journal members defining a pair of coaxially aligned openings for receiving said pin members, each of said journal members depending from opposite second side walls, each of said second side walls having a second indented portion terminating in a generally non-indented strap portion and having a support portion located axially inwardly from said strap portion and from said second indented portion, said strap portion defining a first generally semicircular opening and said support portion defining a second generally semicircular opening axially offset from and facing in a direction towards said first generally semicircular opening whereby a pin opening is defined by each of said journal members, each said pin opening being in axial alignment with the other and being of a size to rotatably supportingly receive one of said pins,
said journal members generally located within the confines of the periphery of said second side walls,
said strap portion having a generally solid cross-section and being formed by compression molding of the material generally from a double wall of the parison to form said cross-section to have an axial width greater than that of a single thickness of the parison,
said first indented portion being of a depth sufficient to receive the total width of the associated one of said journal members whereby each of said journal members and said pins are located within the periphery of said first and second side walls,
said support portion being of a solid construction and being formed by compression molding of the material generally from a double wall of the parison,
said strap portion being of a flexible construction whereby assembly onto an associated one of said pins is facilited and each of said pins can be readily located in the associated one of said pin openings.

4,029,235
ONE-BY-ONE PNEUMATIC SEEDER
Xavier Roger Grataloup, Montereau, France, assignor to Nodet-Gougis, France
Filed Mar. 15, 1976, Ser. No. 666,969
Claims priority, application France, Mar. 27, 1975, 75.09766
Int. Cl.² A01C 7/04
U.S. Cl. 221—211 13 Claims



1. In a one-by-one pneumatic seeder including a hopper with a rotary dispenser disc forming a wall portion thereof, said rotary dispenser disc having a series of equidistant holes arranged in an annular zone concentric with the axis of rotation of said dispenser disc, a part-circular suction chamber adapted to be connected to a source of partial vacuum and disposed along the face of said dispenser disc remote from said hopper and in alignment with said annular zone on said disc, said suction chamber having first and second ends in the direction of said holes opposite said part-circular suction chamber at any given time being subjected to the partial vacuum while said holes beyond the ends of said part-circular suction chamber are subjected to atmospheric pressure, wherein the improvement comprises seed dislodging means for gradually rocking each seed loose in its hole before each seed arrives at said second end of said suction chamber with all seeds being released for substantially identical successive drop trajectories, said seed dislodging means being disposed on the side of said dispenser disc remote from said suction chamber and arranged along and juxtaposed to the annular zone of said dispenser disc, the annular zone being relatively rotatable with respect to said dislodging means, said dislodging means gradually approaching but without crossing the circle defined by the centers of said holes in said annular zone, the portion of said dislodging means closest to said circle being disposed substantially at and opposite the second end of said partcircular suction chamber.

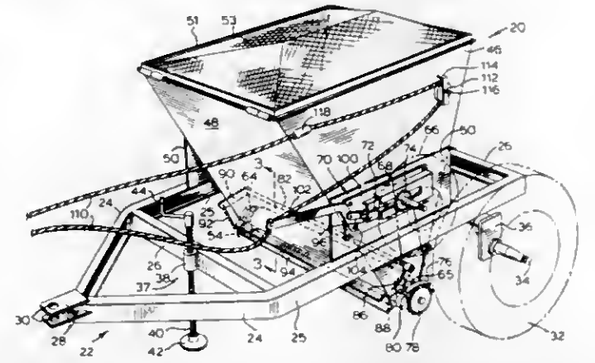
4,029,236
TWO PRODUCT DISPENSER WITH COOPERATING TELESCOPING CYLINDERS
John C. Carson, Jr., Manasquan Park; Robert T. Hall, Trenton; Divaker B. Kenkare, South Plainfield, and Clarence R. Robbins, Piscataway, all of N.J., assignors to Colgate-Palmolive Company, New York, N.Y.
Filed May 17, 1976, Ser. No. 686,843
Int. Cl.² B67D 5/56
U.S. Cl. 222—135 10 Claims



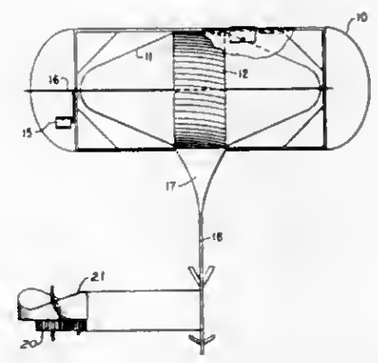
1. A product dispenser comprising a first cylinder having an end wall, a piston plate in said cylinder having hollow piston rod extending slidably through said end wall for communicating and dispensing the contents of said cylinder outwardly of said cylinder, a second cylinder having a forward wall provided with a delivery tube therein and a vent tube communicating with the interior of said first cylinder, said first cylinder functioning as a piston for said second cylinder, said piston rod being fixedly secured to said forward wall so that movement of said end wall toward said forward wall will move said piston plate away from said end wall to force a first product in said first cylinder outwardly through said piston rod and to force a second product in said second cylinder out through said delivery tube.

4,029,237
SAND SPREADER
Pietro Miconi, 78 Aviemore Drive, Weston, Ontario, Canada
Filed Mar. 20, 1975, Ser. No. 560,669
Claims priority, application Canada, May 23, 1974, 200656
Int. Cl.² E01C 19/20
U.S. Cl. 222—614 8 Claims

1. A sand spreader comprising:
a frame;
ground wheels coupled to and supporting the frame for movement over the ground in use;
a sand hopper mounted on the frame and having an opening at its lower end through which sand can be dispensed;
a rotary auger mounted in the hopper and positioned in said opening therein for controlling the flow of sand from the hopper in use; and,
a driving wheel which is drivably coupled with the auger;
a slide supporting the driving wheel for movement between an operative position in which the wheel is in peripheral engagement with one of the ground wheels supporting the frame of the spreader, whereby rotation of that ground wheel as the spreader moves over the ground in use drives the auger by way of the driving wheel, and an inoperative position in which the driving wheel is clear of the relevant ground wheel;
a lever for moving the slide between a first position in which the driving wheel is in its said operative position and a second position in which the driving wheel is in its said inoperative position; and,
an over-centre linkage coupling the lever to the slide, said linkage being adapted to lock the slide in said first position when the lever is moved in the appropriate direction.

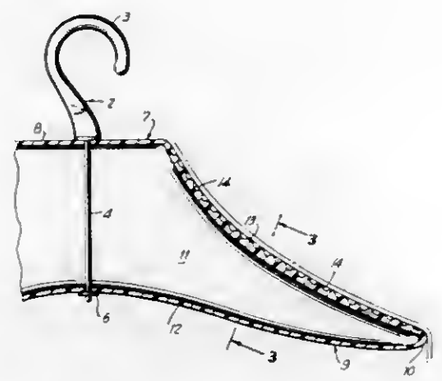


4,029,238
PNEUMATIC PLANTER
Leon C. Jalas, R.R., Sutherland, Iowa 51058
Filed Mar. 25, 1976, Ser. No. 666,741
Int. Cl.² B67D 5/24
U.S. Cl. 222—193 9 Claims



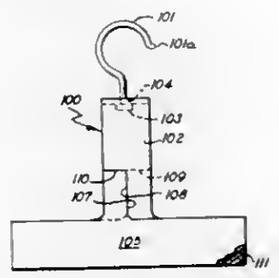
1. Seed planting means comprising a pressurized tank, seed container means in said tank, power driven rotating means connected with said seed container means, said rotating means being formed to provide seed carrying openings, said tank including an outlet, said seed carrying openings being movable by said rotating means to pass said outlet whereby seeds are delivered individually to said outlet, and nozzle means leading from said outlet through which said seeds are accelerated and from which they are discharged.

4,029,239
CLOTHES HANGER
John E. Dolan, Old Orchard St., Harrison, N.Y. 10528
Filed Jan. 26, 1976, Ser. No. 652,231
Int. Cl.² A47J 51/097
U.S. Cl. 223—85 3 Claims



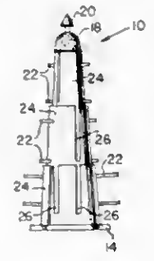
1. A clothes drying hanger comprising a unitary completely enclosed, hollow plastic body having a central truncated conical section and a pair of downwardly diverging arms, said body including substantially spaced front and back walls curving from a normal vertical plane, the upper surfaces of each of said arms being upwardly convex in the transverse direction;
the lower web or bottom wall of said enclosed, hollow plastic body extending from each end in an upward inclination toward the central vertical axis thereof;
a series of transverse, closely spaced, grooves in a substantially continuous, sinuous cross-sectional configuration along the length of said arms, said grooves being inclined along the length of said arms and being integrally formed to follow the transverse convex contour of said upper surfaces and to be defined by ridges flush with said upper surfaces.

4,029,240
GARMENT HANGER
Paul J. George, P.O. Box 86, Brecksville, Ohio 44141, and M. Ted Raptes, 2111 Jefferson Davis Hwy., Arlington, Va. 22202
Continuation-in-part of Ser. No. 401,292, Sept. 27, 1973, Pat. No. 3,923,213. This application Oct. 8, 1975, Ser. No. 620,719
Int. Cl.² A47J 51/14
U.S. Cl. 223—96 7 Claims



1. A hanger for gripping and suspending a garment permitting it to hang freely, said hanger formed from a unitary plastic development member which is substantially planar and has a generally I-configuration, said development member comprising an intermediate longitudinal yoke member and a transverse gripper member at each extremity of said yoke means, said yoke means comprising a longitudinal cutout section adjacent each yoke extremity, said cutout sections being on opposite longitudinal sides of said yoke means, said gripper members comprising frictional gripping surfaces having a planar dimensional area disposed on the same side of said planar development member, said development member looped on itself with said gripper members crossed over on each other and said cutout sections are engaged and in abutment with each other, whereby said yoke means is maintained in a generally longitudinal arcuate looped form having a spring biasing action, and whereby said gripping surfaces of said gripper members are maintained in a face to face parallel closed position with each other by said spring biasing action, a removable suspending means for said development member connected to the upper portion of said arcuate yoke means, whereby said gripper members can be separated by a squeezing action on both sides of said arcuate yoke means to thereby enable a garment to be inserted between said gripping surfaces of said gripper members and to be frictionally held therebetween by said gripping surfaces upon release of said squeezing action on said arcuate yoke means.

4,029,241
SPOOL STAND
Harry Krake, 3617 Farmington Road, Minnetonka, Minn. 55343
Filed Aug. 3, 1976, Ser. No. 711,169
Int. Cl.² A41H 31/00
U.S. Cl. 223—106 4 Claims



1. A spool stand having a longitudinal axis, a base and a top, comprising:
a pin cushion disposed on said top;
a handle disposed on said pin cushion;
a plurality of arms extending transversely to said axis along the circumference of the spool stand, and a plurality of concentrically disposed sections, and wherein at least two of said arms extend from each of said sections, one of said sections being a base section, the remaining of said sections being substantially collapsible into said base section.

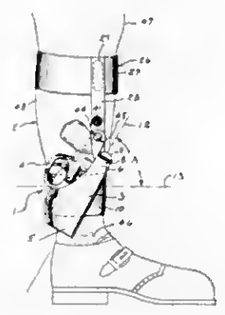
LEG HOLSTER
Martin J. Stoesser, 2407 Springdale Rd., Apt. 7C, Waukesha, Wis. 53186
Filed Dec. 21, 1973, Ser. No. 427,229
Int. Cl.² F41C 33/02
U.S. Cl. 224—2 B 13 Claims



1. An apparatus removably securing a hand gun to a human leg, comprising a holster having an opening and removably retaining a hand gun, a first leg encircling member selectively connected about said leg near an ankle bone and well below a calf and connected to said holster, a second leg encircling member selectively connected about said leg slightly below a knee cap and at or slightly above the calf and spaced substantially from said gun retaining opening, and a connector assembly including means connecting said first leg encircling member and said second leg encircling member and essentially eliminating bouncing of said holster and turning of said first leg encircling member through leg movement and securing and stabilizing said hand gun to said human leg.

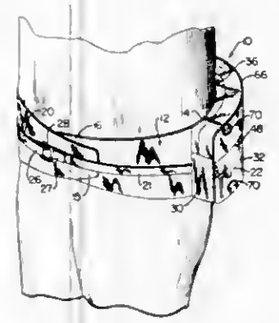
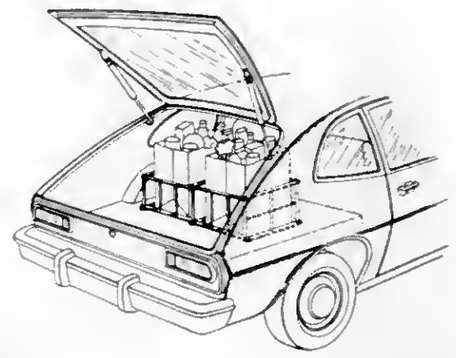
INTEGRATED BELT-SUPPORTED BACKPACK
Alan H. Zerobnick, Estes Park, and David J. Cole, Denver, both of Colo., assignors to Samuel Zerobnick, Denver, Colo.
Filed Feb. 28, 1975, Ser. No. 553,930
Int. Cl.² A45F 3/00
U.S. Cl. 224—8 R 8 Claims



1. A belt-supported backpack adapted to be worn around a person's waist, comprising in combination:
an elongated flexible belt of unitary construction consisting of a relatively wide intermediate section and forwardly tapered free ends extending away from opposite ends of said intermediate section,
fastener means at the free ends of said belt for releasably and adjustably securing said free ends together,
a flexible pack including a main compartment affixed to the intermediate section of said belt, said intermediate section of said belt defining the inner wall of said main compartment, said compartment traversing the entire width and length of said intermediate section, said main compartment having inner and outer walls separated by opposite sides, top and bottom walls interconnecting said inner and outer walls in spaced parallel relation to one another, and an access opening into the interior of said main compartment extending continuously across said top wall and at least the upper portions of said opposite side walls,
an auxiliary compartment affixed to the external surface of the outer wall of said main compartment and substantially coextensive with said main compartment, said auxiliary compartment provided with an upper access opening into said auxiliary compartment, a releasable closure across said upper opening, and a separate side access opening into said auxiliary compartment including a separate releasable closure therefor, and
said belt being sized to be fastened around a person's waist with the wider intermediate section of said belt curving around the lower back and terminating on opposite sides of the person's waist, said main compartment conforming to the contour of said intermediate section when worn around a person's waist.

4,029,244
COLLAPSIBLE RECEPTACLE TYPE STAND FOR USE IN TRANSPORTING LOADED GROCERY BAGS
Izora M. Roberts, 7215 NE. 175th, Sp 124, Botbell, Wash. 98011
Filed Dec. 29, 1975, Ser. No. 644,720
Int. Cl.² B60R 5/00; B65D 7/24
U.S. Cl. 224—42.42 R 5 Claims



1. A collapsible stand for maintaining loaded grocery bags, or the like, in an upright position even when subjected to sudden inertial forces such as those caused by the stopping, starting or turning of the vehicle in which the grocery bags are being transported, comprising:
spaced apart, open-worked end and side walls defining an enclosure, wherein each end wall comprises an upper and lower end rail, and wherein each side wall comprises two upper side rails placed in end-to-end relation and two lower side rails placed in end-to-end relation;
first pivotal means to pivotally interconnect the end and side walls;
second pivotal means to pivotally interconnect the two upper side rails and the two lower side rails of each side wall;
an open worked intermediate wall, extending between the spaced apart side walls to divide the enclosure into a pair of adjacent compartments having the intermediate wall as a common wall, and comprising an upper and lower intermediate rail, wherein each end of the intermediate wall is pivotally connected to its respective side wall by its respective side wall's second pivotal means;
whereby the first and second pivotal means enable each adjacent compartment to be moved between an open position, for receiving a grocery bag which is prevented from tipping by bearing against the end, side and intermediate rails which surround it, and a collapsed position for more compact storage when not in use, wherein when both adjacent compartments are collapsed, the collapsed length of the stand is substantially equal to the length of the end wall plus one half of the length of one side wall.

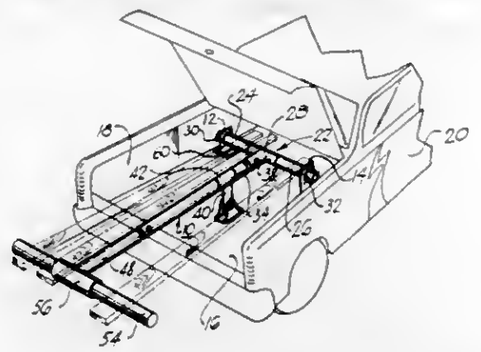
AUTOMOBILE MATERIAL CARRIER
David L. Berlin, 10503 S. 198th E. Ave., Broken Arrow, Okla. 74012
Filed Jan. 14, 1976, Ser. No. 648,966
Int. Cl.² B60R 11/00
U.S. Cl. 224—42.43 5 Claims

1. A carrier for an automobile trunk compartment comprising:
a. a first tubular cross member;
b. a pair of hinged brackets adapted to be mounted at opposite sides of the trunk floor, said brackets including means for supporting said cross member above said floor between said brackets;
c. a longitudinal tubular member, means for connecting one end of said longitudinal member to said first cross member;

d. a second tubular cross member, means for connecting the other end of said longitudinal member to said second cross member, said longitudinal member being of a length such that said other end extends out of said trunk compartment, and a vertical support member adapted to rest



on said trunk floor to support said longitudinal member above said floor, said longitudinal member includes a plurality of longitudinal sections and means for securing said sections together, whereby said carrier is utilized to provide support for elongated articles greater in size than said compartment.

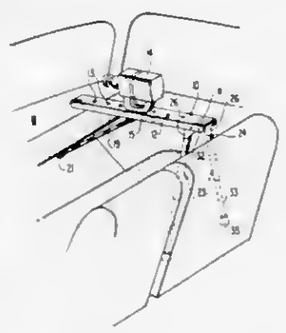
ADJUSTABLE STABLE CAMERA SUPPORT FOR VEHICLES

Robert L. Woodruff, P.O. Box 1008, Florissant, Mo. 63031

Filed Apr. 13, 1976, Ser. No. 676,521
Int. Cl.² B60R *11/04*
U.S. Cl. 224—42.45 B **2 Claims**



1. A stable adjustable camera support for vehicles comprising an elongated camera supporting channel beam having a plurality of longitudinally spaced openings in its top web and having downturned side flanges, the forward end of said channel beam during use adapted to rest on top of a vehicle instrument panel, a camera engaging eye screw engageable selectively through any of said openings from below the channel beam to secure a camera in a selected adjusted position fixedly on top of the channel beam, an elastic flexible holddown and stabilizing means for the channel beam having opposite end hooks, one hook engageable with the vehicle instrument panel and the other hook engageable with said eye screw, a pair of rear telescopically adjustable foldable support legs for the rear end of said channel beam adapted to rest on a vehicle front seat cushion in laterally divergent relationship, heads secured to the tops of said legs and each said head having outer parallel faces which lie immediately inwardly of said side flanges when the legs are in a vertical use position, a pivot pin for said heads connected to and extending between said side flanges, the heads being apertured to loosely receive said pin, and an expansion spring on said pivot pin engaging said beads and urging them outwardly into contact with said side flanges, whereby when said legs are extended for usage to the vertical use position the channel beam may be leveled or set at any desired angle to the horizontal by merely adjusting the lengths of the support legs and when said legs are moved toward each other from the laterally divergent relationship to a nearly parallel position said legs may then be pivoted on said pin into a folded stored relationship in said channel beam and between said downturned side flanges.

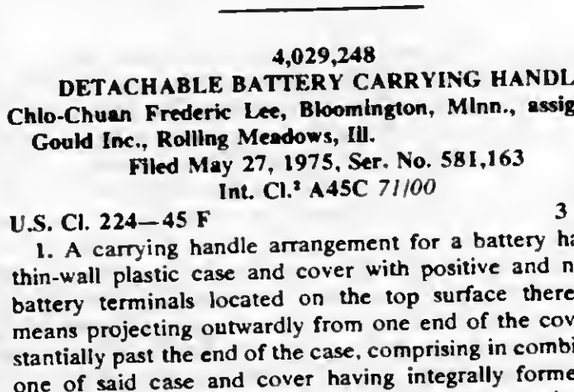
STRIP FEEDING MECHANISM

Douglas M. Sakariason, Minneapolis, Minn., assignor to Pako Corporation, Minneapolis, Minn.

Filed Aug. 25, 1975, Ser. No. 607,679
Int. Cl.² B65H *25/04*
U.S. Cl. 226—43 **5 Claims**



1. A device for supplying a relatively stiff strip of photographic print paper from a roll in response to the demand of a machine for processing said strip comprising,
a drive roller for withdrawing the strip of photographic print paper from the supply roll,
a pressure roller for maintaining a positive driving connection between the strip and said drive roller,
an electric motor connected to said drive roller,
circuit means for supplying electric power to said motor,
an electric switch in said circuit means for controlling the electric power to said motor,
a generally U-shaped guide plate positively defining a loop guide path for said strip downstream from said drive roller to engage the strip from said drive roller and positively form a doubled back tension free slack loop downstream from drive roller, said plate having an opening therein,
a loop sensing switch-actuating element extending through said plate opening and connected to said switch for controlling actuation thereof and mounted in said guide path for sensing the presence of said loop and positioned to close said switch when said loop becomes shorter than a predetermined length, and opening said switch when said loop becomes longer than a predetermined length, and
means for receiving the tension free portion of the strip from said loop and guiding the portion into the machine for processing.

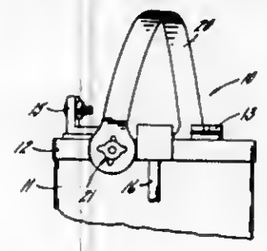
4,029,248

DETACHABLE BATTERY CARRYING HANDLE

Chio-Chuan Frederic Lee, Bloomington, Minn., assignor to Gould Inc., Rolling Meadows, Ill.

Filed May 27, 1975, Ser. No. 581,163
Int. Cl.² A45C *7/00*
U.S. Cl. 224—45 F **3 Claims**

1. A carrying handle arrangement for a battery having a thin-wall plastic case and cover with positive and negative battery terminals located on the top surface thereof and means projecting outwardly from one end of the cover substantially past the end of the case, comprising in combination, one of said case and cover having integrally formed rigid plastic posts protruding horizontally from opposite vertical surfaces thereof at either end and laterally offset in equal and opposite directions from the longitudinal center line of said case such that a vertical plane passing through the center of said posts also passes substantially through the center of gravity of the battery, each of said posts having a hollow stem portion with a closed inner end secured to said surface and a hollow non-circular head spaced from said surface a predetermined distance, said non-circular head having a predetermined angular orientation with respect to a vertical plane



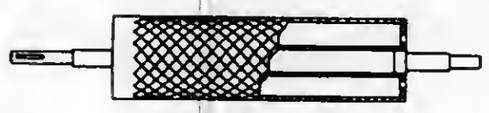
passing axially through said post, and an elongated handle adapted to span the length of said cover without substantial interference with said battery terminals and said projecting means and having at each end thereof an aperture shaped to receive one of said non-circular heads and having an angular orientation with respect to the center line of said handle different than said predetermined angular relation of said head to said vertical plane, said ends of said handle having a thickness adjacent said apertures adapted to fit within said predetermined distance without substantial end play.

4,029,249

ROLLER SYSTEM FOR CONTINUOUS TRANSPORT OF WEBS OF SHEETING

Peter Nagel; Werner Grau, both of Willstaett; Hermann Maier, Ludwigshafen; Heinrich Wittkamp, Mannheim; Roland Falk, Achern, and Paul Willmann, Renchen, all of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Germany

Filed Sept. 12, 1975, Ser. No. 612,757
Claims priority, application Germany, Sept. 12, 1974, 2443663
Int. Cl.² B65H *17/30*
U.S. Cl. 226—95 **4 Claims**



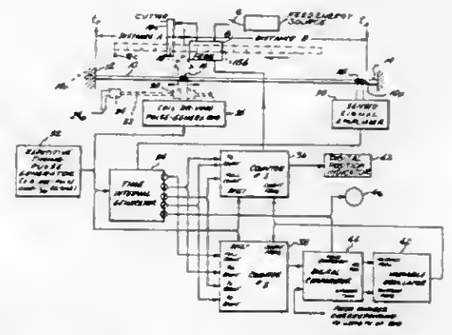
1. An apparatus for transporting and accelerating or decelerating webs of thin sheeting by means of a number of rollers, said apparatus comprising:
a suction roller having a rotational axis, said roller acting as a control point and having a rhombic pattern of grooves formed on its surface, said grooves being obliquely disposed with respect to the axis of said roller
perforations formed on said surface at the points of intersection of said grooves, and
the ratio of total cross-sectional area of said perforations to the effective surface area of said roller being at least 0.7 to not more than 3%.

4,029,250

PHOTOGRAPHIC STRIP TRANSPORT INTERVAL CONTROL

Leonard H. Tall, Mercer Island, Wash., assignor to CX Corporation, Seattle, Wash.

Filed Sept. 23, 1975, Ser. No. 616,017
Int. Cl.² B65H *17/26*
U.S. Cl. 226—136 **5 Claims**



1. Apparatus for processing of photographic strips and the like including an intermittently activatable operating device stationed along a feed path of longitudinal advancement of the strip, stepwise feed means responsive to an electrical command signal and operable to advance the strip by a plurality of successive fixed increments totalling a predetermined feed distance between successive actuations of said operating device, the number of such increments and thereby said feed distance being determined by a digital count command signal applied to said feed means, a movable indication element positioned along said feed path in advance of said operating device and selectively adjustable at will along said strip into selected positional relationship with a desired operative point on the strip, thereby to selectively vary the distance between such element and said operating device, distance measurement means operatively associated with such movable element for deriving an electrical command signal in the form of a digital count corresponding in value to said distance, and means applying said derived command signal to said feed means to control the number of fixed increments produced thereby corresponding to said digital count between successive actuations of said operating device.

4,029,251

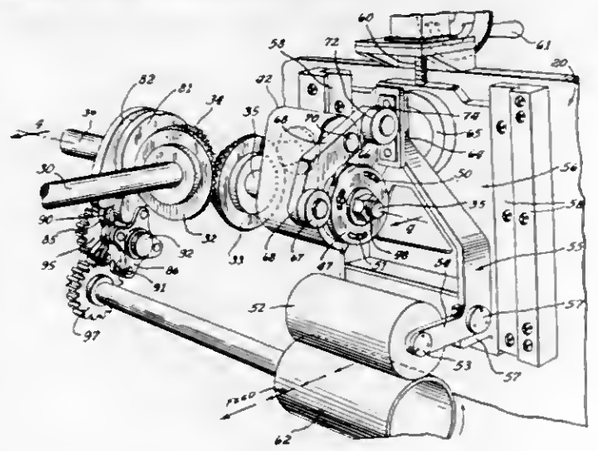
ROLL FEED WITH MODULAR ROLL LIFTER MECHANISM

Keoneth C. Johnson, Des Plaines, Ill., assignor to F. J. Littell Machine Company, Chicago, Ill.

Filed Mar. 15, 1976, Ser. No. 667,134
Int. Cl.² B65H *17/22*
U.S. Cl. 226—154 **5 Claims**

1. In roll feeding apparatus of the character as described, in combination, a pair of feed rolls including a lower driven roll and an upper idler roll, frame structure providing a journalling hub portion, a drive shaft extending through the hub portion to project beyond the same and being journalled for rotation by the hub portion, an idler roll adjusting plate supported by the frame structure for slidable movement in a direction towards and from the lower driven roll, a pivotal bracket mounted on the plate, means provided by the pivotal bracket for journalling the upper idler roll and for positioning the same above and in approximate vertical alignment with the lower

driven roll, and an actuating cam mounted on the projecting end of the drive shaft and having rotation with the shaft for



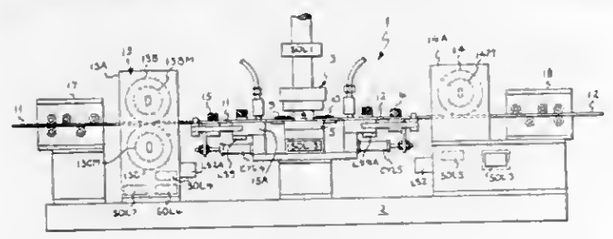
periodically rocking the pivotal bracket to lift the upper idler roll with respect to the lower driven roll.

4,029,252

APPARATUS FOR MAKING A COPPER-ALUMINUM TRANSITION JOINT

Kenneth G. Hawkins, Burnt Hills, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Filed May 17, 1976, Ser. No. 687,068
Int. Cl.² B23K *21/00*
U.S. Cl. 228—3.1 **8 Claims**



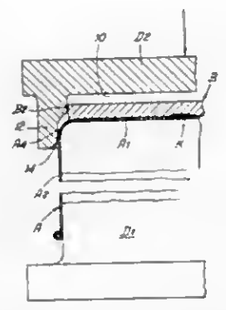
1. Apparatus for making a copper-aluminum transition joint comprising a press having relatively movable first and second dies, the second one of which is a double-acting die including a punch, and having first and second metal shears positioned respectively on opposite sides of said second die and operable to shear strips of metal, first and second rotatable abrading brushes mounted respectively on opposite sides of said press, brush drive means operatively coupled to selectively rotate said brushes, first and second wire feeders mounted respectively on opposite sides of said press between the dies and the brushes, said first wire feeder being operable to intermittently move an aluminum wire past the first brush in abrading relationship therewith and feed the aluminum wire to a position ove the punch, said second wire feeder being operable to intermittently move a copper wire past the second brush in abrading relationship therewith and feed the copper wire into overlapping relationship with the aluminum wire positioned over said punch, first and second brush drive control means responsive respectively to movement of an aluminum wire or a copper wire by said wire feeders to actuate the brush drive means to move said brushes into abrading relationship with said wires and to rotate said brushes, said press being operable responsive to movement of a copper and an aluminum wire into overlapping relationship over the punch to drive said first die toward the punch and the shears therby to shear the copper and aluminum wires and force the overlapped portions of both wires around the punch thereby to form a cold welded intermetallic transition joint between the wires, said first and second wire feeders being operable respectively to retract the aluminum wire and the copper wire predetermined distances back from the shearing edges of said shears responsive to completion of the shearing movement of said first die to shear said wires, and ejecting means mounted on said press and operable to drive a transition joint from between the retracted ends of the aluminum and copper wires and out the press responsive to movement of said first die away from the punch.

4,029,253

METHOD OF HEAT AND PRESSURE BONDING OF PLATES OF HEAT CONDUCTIVE METAL ONTO STAINLESS STEEL SURFACES

Nando Cartossi, Novara, Italy, assignor to Walter Cartossi S.p.A., Ornavasso, Novara, Italy

Continuation of Ser. No. 343,840, March 22, 1973, abandoned. This application Aug. 18, 1975, Ser. No. 605,540
Claims priority, application Italy, Apr. 22, 1972, 23434/72; Aug. 4, 1972, 27923/72
Int. Cl.² B23K *1/04*
U.S. Cl. 228—175 **10 Claims**



1. A method of heat and pressure bonding a bottom plate of heat conductive metal onto the bottom surface of a stainless steel container having a peripheral wall of larger diameter than the bottom surface and a connecting surface sloping from the bottom surface to the peripheral wall, the method comprising:

placing into laminar assembly with said bottom surface a plate of heat conductive metal of an original diameter substantially the same as the diameter of said bottom surface and with the edge of the plate spaced from the diameter of said peripheral wall by substantially the width of said connecting surface;

heating the assembly to nearly the fusion temperature of the heat conductive metal of said plate;

while the assembly is at said temperature applying bonding pressure uniformly over the full area of the plate to effect fusion bonding of the plate to said bottom surface;

closely confining the perimeter of the plate for firmly retaining the edge substantially against spreading from its original diameter and holding said plate and said bottom surface against relative displacement while applying said bonding pressure whereby to assure uniformity of pressure and bonding of the plate throughout its area to said bottom surface.

4,029,254

METHOD OF DIFFUSION BONDING AND BRAZING OF MATERIALS

Winford Blair, La Mesa, and Melvin M. Schwartz, La Jolla, both of Calif., assignors to Rohr Industries, Inc., Chula Vista, Calif.

Filed Aug. 9, 1976, Ser. No. 712,710
Int. Cl.² B23K *31/02*
U.S. Cl. 228—181 **14 Claims**

1. A method of bonding honeycomb core material to its facing sheets wherein said core and facing sheets have been formed into a substantially semi-circular configuration and wherein said core and facing sheets are made of similar material and the edges of said core and said facing sheets or both

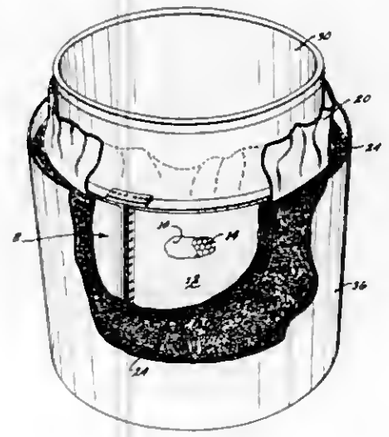
have had deposited thereon a laminate formed of diffusion bridge or braze alloy material which comprises the steps of:

a. positioning together the faying surfaces of the facing sheets and core to be bonded with the core located between the facing sheets thereby forming a generally tubular assembly;

b. inserting a mandrel into the interior of the tubular assembly wherein the diameter of the mandrel is slightly smaller than the interior diameter of the tubular assembly and wherein the mandrel is formed from a metal having a thermal coeffecient of expansion greater than that of the material of the facing sheets and core;

c. inserting the combined mandrel and tubular assembly of step (b) into a container having an open top surface wherein the height of the container is greater than the height of the tubular assembly and wherein the width of the container is greater than the width of the tubular assembly thereby forming a chamber surrounding the tubular assembly within the container;

d. filling the chamber formed in step (c) with pellets at least to the height of the tubular assembly to produce a positive



pressure against the surface of the outer facing sheet thereby subjecting the faying surface to sufficient pressure to maintain position and alignment for joining;

e. heating the container and all the items placed in it in steps (c) and (d) from ambient temperature to a higher temperature wherein joinder occurs at a temperature lower than the beta transus of any of the metals involved in the process and while this heating is continuing, the expansion of the mandrel will be exerting kinetic pressure against the interior of the tubular assembly and the pellets located within the chamber will be transferring at least a portion of said pressure against the outer surface of the tubular assembly while the lack of a confining surface against the pellets from the top of the chamber allows the level of the pellets to rise and fall as a safety valve against undue pressures being exerted against the walls of the tubular assembly;

f. maintaining the temperature at a controlled rate at a predetermined level and holding it for a sufficient length of time to cause bonding of the materials, and;

g. lowering the temperature by a predetermined cooling period to ambient.

4,029,255

SYSTEM FOR OPERATING A STEAM TURBINE WITH BUMPLESS DIGITAL MEGAWATT AND IMPULSE PRESSURE CONTROL LOOP SWITCHING

Richard S. Heiser, Pittsburgh, and Anthony I. Scott, Greensburg, both of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Continuation of Ser. No. 247,854, April 26, 1972, abandoned. This application Oct. 16, 1973, Ser. No. 407,025
Int. Cl.² F01D *17/02*; **G05B** *15/00*
U.S. Cl. 235—151.21 **16 Claims**
